A neural network, using the backpropagation paradigm, that is taught the relationship between employment in the graphic arts industry - (Standard Industrial Classification Code (SIC) 27) - and economic variables and solvent consumption by SIC 27 is discussed. The project is a proof of concept whose objective is to a relationship using national-level data, which are known, and apply it to estimating solvent consumption on the county level, where data are thus far not available. The network accurately learns a relationship from national data. Although definitive testing is not yet possible due to data limitations, there are indications that the national relationship can be used to estimate county-level solvent consumption. Network inputs are SIC 27 employment, productivity for the current and 1 prior year, and an eight-element 'signature' of quarterly economic changes in output from non-durable industries. One hidden layer of two processing elements connects the 11-element input layer to a 1-element output layer. NeuralWare Professional II Plus Version 4.0 was used as the platform. Training requires 30,000 iterations and results in a Pearson's r value of 0.99. The best result achieved by ordinary least squares regression was 0.93. NTIS

GLOBAL WARMING ISSUE AND GLOBAL ECONOMIC MODEL
10 Nov. 1992 215 p
(DE93-781334; IEE-SR-237) Avail: CASI HC A10/MF A03

Global economic models for CO2 emission control are studied to cope with the global warming problem. Various models simulate macro-economically economic effects associated with CO2 emission control, that is, carbon tax, gross domestic product (GDP) losses, the market of CO2 emission rights, effects on the international trade, changes in structure of energy sources, effects on each region, etc. and provide the data to judge what control measures should be taken. Each model brings different results. Therefore, in the model comparison project of OECD, by using six models and standardizing among the models, preconditions, region, framework of time, and CO2 reduction scenario of the business-as-usual case which is the standard are addressed and the differences between the models on the carbon tax and economic costs in case of achieving reduction of emission of a certain amount of CO2 are clarified. Moreover, the same model comparison project by Stanford University is introduced which places emphasis on production in the energy sector. The details of various models made for simulation are reported in the itemized discussions. DOE

ASSESSMENT OF ENERGY TECHNOLOGIES CONTRIBUTING TO ENVIRONMENTAL CONSERVATION
Mar. 1992 158 p
(DE93-781439; NEDO-ITE-9105) Avail: CASI HC A08/MF A02

Paying attention to energy technologies which have great effects on control of greenhouse effect gas emissions, analysis, and assessment are made on effectiveness of each technology (effect, cost, usability, and quality of technology) to study an outlook for future development. Assessment of technological options is explained. Energy conservation and improvement of efficiency in production, conversion, distribution, and end use of energy are one of the most effective measures. The technology to recover and isolate CO2 emitted in burning fossil fuels is worth studying. The photovoltaic power generation has a possibility of being applied to deserts and the surface of the ocean on a large scale, if energy transportation technology is substantially advanced. Assessment of factors affecting regional and sectoral differences in CO2 emission indicates that clearly such factors as economic development, population growth, energy conservation, changes in industrial structure, fuel switching, and technological advance influence the regional and sectoral patterns of historical energy consumption and CO2 emissions. DOE

STUDY ON TECHNOLOGY FOR EFFECTIVE UTILIZATION OF CARBON DIOXIDE IN VIEW OF GLOBAL ENVIRONMENT
Mar. 1992 201 p
(DE93-781440; NEDO-ITE-9106) Avail: CASI HC A10/MF A03

Research and study are made on the total system used for EOR (Enhanced Oil Recovery) as a means to recover CO2 from fixed emission sources and fix it. An EOR feasibility study is carried out in East Kalimantan, Indonesia. Further, researches at home and overseas are made on iron making, oil refining, cement and natural gas refining as well as electric power as CO2 fixed emission sources, and it is found that the system which uses the local fixed emission source is also possible. For optimization of the total system, EOR, CO2 recovery/liquefaction, transport vessels carrying both LPG and LCO2, and recycle plants are studied. In the estimation, the cost of CO2 is higher than that of CO2 used in the injection of CO2 presently conducted on a commercial base, but the cost is expected to be reduced by future technical development. The method in which CO2 is fixed while performing EOR is an extension of the technology already carried out and seems to have the earliest materialization as a system. DOE

FUGITIVE HYDROCARBON EMISSIONS FROM PACIFIC OCS FACILITIES, VOLUME 1 Final Report
30 Nov. 1992 575 p See also PB82-217126 and PB93-173805
(Contract DI-14-35-0001-30428)
(PB93-173797; OCS/MMS-92/0043-Vol-1) Avail: CASI HC A24/MF A04

In January 1989, the Minerals Management Service (MMS) conducted a study using the latest approved methods for emission screening and sampling solely on Outer Continental Shelf (OCS) oil and gas platforms in the Santa Barbara Channel in order to determine platform emission rates more representative of that region. The study was designed and reviewed throughout its conduct by a Quality Review Board (QRB) composed of air resource agencies and industry. Representatives from the Tri-county Air Pollution Control Districts and the MMS actively participated at these meetings. Some participants expressed concerns about some of the methods used and the study results. ABB's thorough responses to these questions and comments were submitted to all reviewers before the printing of the final report, and are contained in appendices of the study final report now available to the public. The results of the MMS study show that the average emission factors for the Pacific OCS oil and gas facilities measured in 1989 are 3.5 times lower than those Pacific OCS facilities sampled in the 1979 API/Rockwell study, and 7.8 times lower than the Gulf of Mexico OCS facilities sampled in the same 1979 study. Efforts to determine the quantitative effect of inspection and maintenance programs on controlling emissions were inconclusive. NTIS

DEVELOPMENT OF ULTRAVIOLET ABSORPTION PHOTOMETER FOR ATMOSPHERIC OZONE MEASUREMENTS AND RESULTS FROM MID-LATITUDE INVESTIGATIONS Ph.D. Thesis
Bhaswar Sen 1992 254 p
Avail: Univ. Microfilms Order No. DA9309710

The design and construction of a dual-beam ultraviolet-absorption photometer, as a balloon payload, for ozone measurements is described. Then, the construction of a rocket-borne version of the instrument and results of tests performed in the laboratory are described. Results of balloon sights using this instrument and a NASA-JSC/UH ultraviolet photometer are finally presented. Measurement of ozone in the atmosphere can be made using the strong photometric absorption feature of the gas at 253.7 nanometers. An ultraviolet lamp produces identical optical paths through two absorption columns. Two photodetectors measure the intensity of light through the two columns and a third detector just adjacent to the lamp provides a monitor of integrated light intensity, thus allowing detection of (and on board corrections to) changes in lamp output. A four-port valve in series with an ozone scrubber periodically reverses the two columns between ozone measurement and reference cycles. In this way, instrumental drifts and differences in the two optical paths can be monitored, and corrections, both scientific and engineering, can be deduced. Fast ozone measurements can be made along with other meteorological parameters, allowing good determination of the vertical profile of ozone. Ozone profiles computed from standard photochemical models are usually lower than those determined from satellite measurements; the discrepancies are typically forty percent of measured values at 50 km, and fifty percent at 80 km. Ozone column density measurements with ground based instruments and rocket-borne detectors agree with satellite data, but with a wide variation in accuracy and precision. In situ measurement of ozone with high accuracy, precision, and good spatial resolution would allow testing of (1) current and future photochemical models, and (2) predicted diurnal and seasonal variation in the mesosphere. Details are presented of our ultraviolet photometer adapted for rocket operation and laboratory test results are discussed. Mid-latitude stratospheric ozone measurements using the NASA-JSC/UH and the dual-beam ultraviolet-absorption photometer are presented. Enhancement in tropospheric ozone is evident in data from the summer (1988, 1989, and 1990) flights. Fine structures in the vertical ozone profile correlate closely with structures in the ambient air temperature. Intercomparison of the two photometers and the 1986 Ozone Reference Model for the Middle Atmosphere verifies the high precision and accuracy of the ultraviolet photometers. The overall agreement between the ultraviolet photometer data, the ozone model, and the TOMS total column ozone measurements are very good. Dissert. Abstr.

EMISSION INVENTORIES: A GLOBAL MODELING PERSPECTIVE
J. Dignon and T. E. Graedel (Bell Telephone Labs., Inc., Murray Hill, NJ.) 18 Nov. 1992 8 p Presented at the Air and Waste Management Association (AWMA) Conference, Durham, NC, 19-22 Oct. 1992
(Contract W-7405-eng-48)
(DE93-005817; UCRL-JC-110372; CONF-9210280-1) Avail: CASI HC A02/MF A01

Concern regarding human induced changes in the chemical and radiative properties of our atmosphere through increased emission of trace gas species has received considerable attention. Effective models are needed to understand the future of ozone, global warming, and other important anthropogenic perturbations before policy decisions can be considered. In order to model accurately, knowledge of the temporal and spatial trends in the emissions of the radiatively and chemically important trace species is required. Since many models are currently being used to understand these issues, model validation with experimental measurement becomes extremely important. Emissions inventories commonly pay a bridging role between atmospheric measurement and model studies. DOE

GLOBAL WARMING POTENTIAL FOR SF6
A. S. Grossman and D. J. Wuebbles Dec. 1992 3 p
(Contract W-7405-eng-48)
(DE93-007394; UCRL-ID-112944) Avail: CASI HC A01/MF A01

Sulfur hexaflouride (SF(sub 6)) is a trace gas in the atmosphere which, due to its long lifetime of approximately 3200 years (Ravishankara, 1992), could contribute significantly, if concentrations grew large enough, to concerns about global warming via the greenhouse effect. According to Rinsland et al. (1990), SF6 is widely used as an insulating gas in the high voltage electrical equipment industry. While the present day concentration of SF6 is small, Watson and Siddicoat (1985) show a linear increase rate of 0.084 pptv/yr. between 1970 and 1984. This increase coupled with the long lifetime of SF6 could, over an extended period of time, cause measurable contributions to global warming concerns. In a recent publication, an approximate model for the calculation of the Global Warming Potentials (GWP's) of trace gases in the atmosphere was described. The main purpose of this paper is to use the GWP model to calculate the GWP of SF6. DOE

STATE OF THE ART: ECOLOGICAL BIOMARKERS
L. R. Shugart 1992 9 p Presented at the NATO ARW on Use of Biomarkers in Assessing Health and Environmental Impacts of Chemical Pollutants, Luso, Portugal, 1-5 Jun. 1992
(Contract DE-AC05-84OR-21400)
(DE93-006621; ESD-Publ-4018; CONF-9206339-1) Avail: CASI HC A02/MF A01

It is especially difficult to demonstrate the effect of environmental pollution at the Ecosystem level, where populations and communities are studied. Although pollution can produce stress at the Ecosystem level, the response observed is latent and so far removed from the initial event of exposure that causality is almost impossible to establish. Risk assessment to date has relied on models that use toxicity data and physical properties of chemicals. This approach has been ineffective at the Ecosystem level because of the complexity of pollutants in the environment and the variability in susceptibility of the numerous species present. The use of biological responses (biomarkers) in organisms present in a polluted environment is an approach that may resolve some of the problems outlined. Chemicals are known to elicit measurable and characteristic biological responses in exposed organisms. Such evidence can provide a link between exposure and effect. Unfortunately, this area of endeavor has received little attention until recently. It has only been within the past several years that authoritative texts have become available to document the application of this promising approach. DOE

Liquid product monitoring is the predominant method of external leak detection where the water table is within the zone of excavation. The paper discusses the use of liquid product monitors at new and old tank installations for detecting leaks from underground hydrocarbon storage tanks. The paper discusses the site conditions under which liquid product monitors can be effectively used, conditions which may mitigate or prevent the effective use of liquid product monitors and the construction and placement of liquid product monitoring wells. Liquid product monitors are not used to determine the rate of tank leak. The rate of tank lead can be determined by other methods such as inventory or internal monitoring methods. Effective use of liquid product monitors or any other method of leak detection requires training and experience on the part of the user. NTIS

SUMMER 1990 ATLANTA OZONE PRECURSOR STUDY (JANUARY 1993)
Larry J. Purdue 1993 15 p Presented at the VOC Workshop Assessment and Evaluation, Amersfoot, The Netherlands, 26-28 Jan. 1993
(PB93-167203; EPA/600/A-93/044) Avail: CASI HC A03/MF A01

During the summer of 1990, the U.S. Environmental Protection Agency (EPA) conducted a major monitoring study in Atlanta, Georgia, addressing the measurement of ozone and its precursors. The study was undertaken to obtain an information base to support the development and implementation of improved strategies for reducing ozone in U.S. cities that are out of compliance with EPA's National Ambient Air Quality Standard (NAAQS) for ozone. The primary objective of the study was to collect a comprehensive data base of ambient concentrations of ozone and ozone precursors during the summer ozone season at six sites distributed across the Atlanta metropolitan area. A report describing the details of the experiment and summarizing the resulting data base is available. The data base containing more than 300,000 hourly measurements of the 60 parameters addressed is also available on a 3.5 inch disk. The lecture provides an overview of the study, focusing on its objectives and its experimental design with a limited discussion on results and interpretation. NTIS

EXPLOITATION OF PARALLELISM IN CLIMATE MODELS
F. Baer, J. J. Tribbia, and D. L. Williamson 1993 9 p
(Contract DE-FG05-91ER-61219)
(DE93-011259; DOE/ER-61219/2) Avail: CASI HC A02/MF A01

The US Department of Energy (DOE), through its CHAMMP initiative, hopes to develop the capability to make meaningful regional climate forecasts on time scales exceeding a decade. This capability is to be based on numerical prediction type models. We propose research to consider theoretical limits for prediction of climate and climate change on appropriate time scales, to develop new mathematical techniques to utilize massively parallel processors (MPP), to actually utilize MPP's as a research tool, and to develop improved representations of some processes essential to climate prediction. In particular, our goals are as follows: reconfigure the prediction equations such that the time iteration process can be compressed by use of MMP architecture, and to develop appropriate algorithms; develop local subgrid scale models which can provide time and space dependent parameterization for a state-of-the-art climate model to minimize the scale resolution necessary for a climate model, and to utilize MPP capability to simultaneously integrate those subgrid models and their statistics; and capitalize on the MPP architecture to study the inherent ensemble nature of the climate problem. DOE

STUDY TO DETERMINE THE NATURE AND EXTENT OF OZONE AND OZONE PRECURSOR TRANSPORT IN SELECTED AREAS OF CALIFORNIA Final Report
P. T. Roberts, S. Musarra, T. B. Smith, and F. W. Lurmann Apr. 1992 359 p Sponsored by California State Air Resources Board, Sacramento, Research Div. Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract ARB-A932-129)
(PB93-184828) Avail: CASI HC A16

The project was designed to assess the contribution of transported pollutants to violations of the state ozone standard within the air basins covered by the report using existing data and advanced data analysis techniques. The objectives of the project were to determine the characteristics of ozone and ozone precursor transport within the California air basins covered by the report and to identify whether the contribution of transported pollutants to ozone violations in each downwind area was inconsequential, significant, or overwhelming, relative to locally-emitted pollutants. The precursor pollutants of interest were nitrogen oxides and reactive organic gases. The project evaluated transport to the following areas: The Broader Sacramento Area and the Upper Sacramento Valley; The North Central Coast Air Basin; The Southeast Desert Air Basin (SEDAB); and the Imperial County portion of the SEDAB. TREND SURVEY ON THE ELUCIDATION OF THE GLOBAL WARMING MECHANISM BY THE GOVERNMENTS OF MAJOR INDUSTRIALIZED NATIONS
Mar. 1992 18 p
(DE93-776427; NEDO-ITE-9108) Avail: CASI HC A03/MF A01

This report reviewed 'Trend survey on the elucidation of the global warming mechanism in the governments of major industrialized nations', which has been conducted by EPDC (Electric Power Development Co.) in FY 1991 and is administered by NEDO. Presented are positive stances of the governments of major industrialized nations on their science and technology policies to carry out international tasks, such as global environmental issues, resources and energy problems, etc., or to strengthen their industrial competitive abilities. Also described are the energy policies of world nations, which reflect their global environmental policies and strategies. In taking approaches to global environmental issues of major nations, the U.S. administration spends by far the largest funds for survey and studies to elicidate the scientific mechanism of these problems, which is reflected in the U.S. policy of giving priority to the accumulation of scientific knowledge in dealing with problems of climate changes. Furthermore, a feasibility study on CO2 recovery, transportation and disposal technologies is introduced, which is currently planned by the IEA. DOE

TROPICAL FORESTS AND BIOLOGICAL DIVERSITY: USAID REPORT TO CONGRESS 1990-1991
May 1992 58 p
(PB93-180453; AID-PN-ABL-711) Avail: CASI HC A04/MF A01

Over the last few years environmental concerns have moved to the forefront of USAID's agenda. The report to Congress reviews USAID's efforts to conserve and protect tropical forests and biological diversity during FY's 1990-91. Following an introduction that summarizes the mounting worldwide problems of biodiversity loss and deforestation, Section 1 reviews funding trends for and initiatives in these two areas. Section 2 provides an overview of centrally funded activities, including the Forest Resources Management Project, the Biodiversity Support Program, the Development Strategies for Fragile Lands Project, and the Coastal Resources Management Project. Individual sections then cover USAID activities in Africa, Asia, and Latin America and the Caribbean. Interspersed throughout the report are brief topical summaries which discuss subjects such as U.S. legislative mandates, the Global Environmental Facility, USAID agroforestry activities, African elephant conservation, and the protection of threatened national parks. OVERVIEW OF THE DOE ATMOSPHERIC CHEMISTRY PROGRAM'S OZONE PROJECT
Jan. 1993 51 p
(DE93-007416; DOE/ER-0575T) Avail: CASI HC A04/MF A01

The global atmospheric ozone issue presents a demanding challenge to Department of Energy (DOE) policy analysts, planners, and decision makers, who are responsible for developing and implementing a National Energy Strategy (NES) that maximizes efficient and economical use of US energy resources and, at the same time, minimizes associated impacts on the natural and human environment. On the one hand, recent evaluations of stratospheric and global tropospheric ozone trends indicate substantial anthropogenic impacts that, if allowed to continue, could result in widespread and unacceptable environmental damage. On the other hand, current and proposed remediation efforts have resulted and will result in severe, and potentially unacceptable, socioeconomic impacts. Numerous scientific uncertainties exist concerning changes to the ozone distribution, which complicate the DOE's strategic planning process. Moreover, many ozone-related energy-policy decisions are currently being formulated with minimum participation by DOE. In view of these features, a strong need exists for active DOE participation in global ozone research. This document, which describes the background and initial design for the DOE Ozone Project, defines initial DOE plans for this participation. DOE

STRATEGIC ENVIRONMENTAL RESEARCH AND DEVELOPMENT PROGRAM (SERDP) Annual Report, FY 1992
1992 32 p
(AD-A263745) Avail: CASI HC A03/MF A01

The Strategic Environmental Research and Development Program (SERDP) is intended to identify and develop technology that will enhance the capability of the Department of Defense and the Department of Energy to meet their environmental obligations. Also the program is intended to provide technology and information that may be useful to other government and private organizations in addressing environment concerns. SERDP provides a vehicle to facilitate the transfer of appropriate technology from the private sector to address DoD and DOE environmental and energy issues. Specifically, the purposes of the program are as follows: (1) address environmental matters of concern to DoD and DOE through support for basic and applied research and the development technologies that can enhance the capabilities of the departments to meet their environmental obligations; (2) identify and share research, technologies, and other information developed by DoD and DOE for national defense purposes, involved in the development of energy technologies and of technologies to address environmental restoration, waste minimization, hazardous waste substitution, and other environmental concerns; (3) furnish other governmental and private organizations with data, and enhance collection and analytical capabilities for use by such organizations in the conduct of environmental research; and (4) identify technologies developed by the private sector that are useful to DoD and DOE defense activities concerning environmental restoration, hazardous and solid waste minimization and prevention, and hazardous material substitution, and provide for the use of such technologies. FUGITIVE HYDROCARBON EMISSIONS FROM PACIFIC OCS FACILITIES. VOLUME 2: EXECUTIVE SUMMARY AND USER'S GUIDE
30 Nov. 1992 49 p See also Volume 1, PB93-173797 Sponsored by Minerals Management Service, Camarillo, CA, Pacific OCS Region Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DI-14-35-0001-30428)
(PB93-173805-Vol-2; OCS/MMS-92/0044-Vol-2) Avail: Issuing Activity (National Technical Information Service (NTIS))

Offshore oil and gas production and processing activities may exacerbate existing air quality problems as a result of the release of fugitive hydrocarbon emissions into the atmosphere. In order to address the issue of fugitive emissions from platforms located in Pacific Outer Continental Shelf (OCS) waters, the Minerals Management Service (MMS) of the U.S. Department of the Interior contracted with ABB Environmental Services, Inc. (ABB-ES) in early 1989 to perform emission rate measurements and data analysis on seven platforms off the Southern California coast in outer continental shelf (OCS) waters. The program objectives were to (1) determine fugitive hydrocarbon emission rates from the seven Pacific OCS facilities, (2) develop and evaluate methods for estimating fugitive hydrocarbon emission rates from existing and future Pacific OCS facilities, and (3) evaluate the effectiveness of inspection and maintenance (I & M) programs in the reduction of fugitive hydrocarbon emissions on the seven Pacific OCS facilities. The executive summary briefly describes the methodology used in the current study, as well as the results and conclusions of the study. A Users' Guide for predicting total platform fugitive hydrocarbon emission rates for Pacific OCS oil and gas production facilities based on the data collected in the current study is included as an appendix. MULTI-ATTRIBUTE DECISION THEORY METHODOLOGY FOR POLLUTION CONTROL MEASURE ANALYSIS
A. S. BarreraRoldan (Instituto Mexicano de Petroleo, Mexico City.), A. CoronaJuarez (Instituto Mexicano de Petroleo, Mexico City.), R. W. Hardie, and G. R. Thayer 1992 12 p Presented at the International Symposium on Air Pollution, Monterrey, Mexico, 16-25 Feb. 1993
(Contract W-7405-eng-36)
(DE93-005444; LA-UR-92-4063; CONF-930208-2) Avail: CASI HC A03/MF A01

A methodology based in Multi-Attribute Decision Theory was developed to prioritize air pollution control measures and strategies (a set of measures) for Mexico City Metropolitan Area (MCMA). We have developed a framework that takes into account economic, technical feasibility, environmental, social, political, and institutional factors to evaluate pollution mitigation measures and strategies utilizing a decision analysis process. In a series of meetings with a panel of experts in air pollution from different offices of the Mexican government, we have developed general and specific criteria for a decision analysis tree. With these tools the measures or strategies can be graded and a figure of merit can be assigned to each of them, so they can be ranked. Two pollution mitigation measures were analyzed to test the methodology, the results are presented. This methodology was developed specifically for Mexico City, though the experience gained in this work can be used to develop similar methodologies for other metropolitan areas throughout the world. WHAT'S PAST IS PROLOGUE: SUPPORTING GLOBAL CHANGE RESEARCH WITH HISTORICAL DATA
R. B. Honea, C. L. Floyd (Communication and Information Technology, Inc., TN.), and R. W. Peplies (East Tennessee State Univ., Johnson City.) 1993 9 p Presented at the Annual Meeting of the American Society of Photogrammetry and Remote Sensing, New Orleans, LA, 16-18 Feb. 1993
(Contract DE-AC05-84OR-21400)
(DE93-005777; CONF-930244-2) Avail: CASI HC A02/MF A01

This paper discusses an ongoing effort to analyze historical remote sensing data and to develop a technology to integrate this analysis into a common framework with the satellite imagery. Historical data and metadata from aircraft remote sensor missions, satellite overflights, and other sources from around the world will be used to develop detailed information on the historical changes in the earth's land, water, and atmospheric resources. A PRELIMINARY REVIEW OF GLOBAL CO2 EXCHANGE BETWEEN OCEAN AND ATMOSPHERE
R. Davis and M. Gregg 16 Mar. 1993 50 p Sponsored by DOD
(AD-A264019; JSR-90-302) Avail: CASI HC A03/MF A01

Although the present rate of increase of CO2 in the atmosphere is well documented, changes in the next century cannot be accurately predicted because the CO2 budget is so poorly understood. The atmospheric concentration is increasing 1.4 ppm/year, corresponding to an increase in the atmospheric inventory of 3 Gt/year (1 Gt is 10(exp 9) metric tons or 10(exp 12) kg). This observed increase is less than half of the estimated 8.7 Gt/year released by all sources to the atmosphere. Most of the residual has been assumed to enter the ocean. This cannot be verified directly, however, since the total dissolved inorganic CO2 in the ocean is so much larger than the cumulative release of fossil fuel since 1850 that the change due to fossil fuel is small compared to natural variability. As a result, global CO2 budgets are attempted by calculating the fluxes between ocean and atmosphere and between land and atmosphere. DTIC

Schwartz (Brookhaven National Lab., Upton, NY.), and L. Travis Mar. 1993 63 p
(Contract W-7405-eng-48)
(NASA-TM-108259; NAS 1.15:108259; DE93-009820; DOE/NBB-0092T)
Avail: CASI HC A04/MF A01

The clear-sky climate forcing by anthropogenic aerosols was shown to be of sufficient magnitude to mask the effects of anthropogenic greenhouse gases over large regions. Anthropogenic aerosols are composed of a variety of aerosol types including water-soluble inorganic species (e.g., sulfate, nitrate, ammonium), organic condensed species, elemental or black carbon, and mineral dust. Estimates of the clear-sky forcing by anthropogenic sulfate aerosols and by organic biomass-burning aerosols were published previously. The uncertainty in the forcing by these aerosol types is estimated. Estimates of the clear-sky forcing by other anthropogenic aerosol types do not even exist though the forcing by these aerosol types is thought to be smaller than that by sulfate and biomass burning aerosols. SIMULATION OF LANDSCAPE DISTURBANCES AND THE EFFECT OF CLIMATIC CHANGE
W. L. Baker 29 Jan. 1993 87 p
(Contract DE-FG02-89ER-60883)
(DE93-011615; DOE/ER-60883/3) Avail: CASI HC A05/MF A01

The purpose of this research is to understand how changes in climate may affect the structure of landscapes that are subject to periodic disturbances. A general model useful for examining the linkage between climatic change and landscape change was developed. The model makes use of synoptic climatic data, a geographical information system (GRASS), field data on the location of disturbance patches, simulation code written in the SIMSCRIPT language, and a set of landscape structure analysis programs written specifically for this research project. A simplified version of the model, lacking the climatic driver, was used to analyze how changes in disturbance regimes (in this case settlement and fire suppression) affect landscape change. Landscape change lagged in its response to changes in the disturbance regime, but the lags differed depending upon the character of the change and the particular measure considered. The model will now be modified for use in a specific setting to analyze the effects of changes in climate on the structure of flood-disturbed patches along the Animas River, Colorado. DOE

THE ENVIRONMENT AS AN OPERATIONAL CENTER OF GRAVITY Final Report
Gordan E. VanHook 22 Feb. 1993 57 p
(AD-A264170) Avail: CASI HC A04/MF A01

The increasing influence of environmentalism on the military is analyzed with an emphasis on ecological trends and factors that effect the operational commander. An analysis is conducted to determine the ecological factors within society, government, and international law that impact armed conflict. The potential of means and methods of warfare to damage the environment is described from an historical and ecological domain (air, land, water, and living organisms) perspective. The importance of operational commanders making environmentally sound decisions is determined to be a key component of public support. The growing knowledge of the impact of environmental degradation and the decreasing global threat mean the operational commanders will need to consider the environmental ramifications during target and weapons selection. A list of ecological considerations is provided for the operational commander. DTIC

POLLUTION PREVENTION: A REGULATORY UPDATE
Ann E. Walzer (Martin Marietta Energy Systems, Inc., Oak Ridge, TN.) and

Jay W. Maynard (Maynard, Jay W., Columbus, OH.) 1993 9 p Presented at the Waste Management 1993, Tucson, AZ, 28 Feb. - 4 Mar. 1993
(Contracts DE-AC05-84OR-21400; DE-AC05-76OR-00001)
(DE93-009727; CONF-930205-54) Avail: CASI HC A02/MF A01

Pollution prevention is the emphasis of the 1990s environmental philosophy. This new environmental era was ushered in when President Bush signed the Pollution Prevention Act in October 1990. This law, with its accompanying philosophy, was in response to the realization that end-of-the-pipe treatment, which frequently changed the media in which a pollutant or waste was discharged, was inadequate to protect the environment and human health. Pollution prevention advocates source reduction, where material substitutions and engineering solutions are sought to reduce the volume and toxicity of waste and pollutants. This proactive approach reduces environmental impacts such as those of former waste sites which have produced environmental legacies that will cost billions of dollars and take decades to remediate. This paper describes pollution prevention philosophy and summarizes regulatory pollution prevention requirements. It describes current regulatory trends in the area of pollution prevention, including voluntary programs and enforcement actions. The Pollution Prevention Act of 1990 is described, and pollution prevention initiatives embodied in other laws, including the Clean Air Act, the Clean Water Act, the Emergency Planning and Community Right-To-Know Act, the Resource Conservation and Recovery Act, and the Toxic Substances Control Act, are discussed. A historical overview of waste minimization initiatives within the Department of Energy is given, and other pollution prevention initiatives that affect federal facilities, such as Executive Order 12780, which mandates recycling and the procurement of recycled materials, are also outlined. CASE STUDY OF FRONTAL BOUNDARY STUDY MISSION 03

W. R. Barchet, M. T. Dana, and J. M. Thorp Sep. 1992 70 p
(Contract DE-AC06-76RL-01830)
(DE93-007176; PNL-8384) Avail: CASI HC A04/MF A01

The Frontal Boundary Study was conducted by the Pacific Northwest Laboratory (PNL) for the US Department of Energy in October and November 1989 in central Ohio. This report, which was prepared for the US Environmental Protection Agency, presents the results of the aircraft and surface observations made for one precipitation event during the study, on October 10, 1989. This particular event was selected because of its relatively simple meteorological setting. PNL's Gulfstream (G-1) aircraft was used to sample trace gas concentrations aloft in the inflow region of the precipitation system. Precipitation chemistry and rainfall rate data are presented for the October 10, 1989 event from the network of surface precipitation samplers. Trace gas concentrations and other meteorological variables measured with the G-1 during flight 03 on this date are included. Meteorological observations obtained with radiosondes and radar are also presented. These data sets can be used to evaluate air quality and wet deposition models. DOE

ANNUAL REPORT ON MONITORING OF THE UNSATURATED ZONE AND RECHARGE AREAS AT INEL TO THE STATE OF IDAHO INLEL OVERSIGHT COMMITTEE

D. Horn, J. Liou, and J. Finnie Mar. 1993 121 p
(Contract DE-FG07-91ID-13042)
(DE93-012947; DOE/ID-13042/22) Avail: CASI HC A06/MF A02

This project, begun in March 1991, was originally structured as two separate research efforts: An investigation of the recharge phenomenon and surface water-ground water interactions at the INEL; and a study of water and contaminant movement through the unsaturated zone, including a review of computer models used to described this process. During the initial months of work, it became obvious to those involved in these studies that the two topic areas were intimately related, and work since that time has proceeded with no firm boundaries between the two efforts. Much of the Phase 1 work (March 1991--March 1992) consisted of a detailed review of available literature pertinent to the two research topics and to the INEL site. This Annual Report summarizes the other project activities during Phase 3, and is organized into three sections: Section I -- an overview of the ongoing efforts related to computer model algorithms and data requirements for modeling the transport process in the unsaturated zone (Dr. Jim Liou). Section H -- a review of ongoing work to predict the growth and decay of the ground water mound beneath the INEL spreading basins, using the computer model UNSAT-2 (Dr. John Finnie). Section M -- a final report of the completed study effort examining the recharge rates associated with stream flow in the Big Lost River, and the effects of this recharge on ground water levels at the INEL site (Dr. Dennis Horn). Phase M of the project has now begun, and will conclude in December 1993 with two final reports documenting the work that has been briefly described in Sections I and H of this report. DOE

AN EVALUATION OF FACTORS AFFECTING THE SOLIDIFICATION/STABILIZATION OF HEAVY METAL SLUDGE Final Report

R. M. Bricka and Larry W. Jones Mar. 1993 166 p
(AD-A264128; WES/TR/EL-93-4) Avail: CASI HC A08/MF A02

Solidification/stabilization of hazardous waste involves mixing the waste with a binder material to enhance the physical properties of the waste and to immobilize contaminants that may be detrimental to the environment. Many hazardous wastes contain materials that are known to inhibit the setting and strength development properties of cement and pozzolan binding agents commonly used in solidification/stabilization processes. This study presents the results of an evaluation into the effects of ten interfering substances (oil, grease, lead, copper, zinc, sodium hydroxide, sodium sulfate, phenol, trichloroethylene, and hexachlorobenzene) on the physical and contaminant mobility properties of a solidified/stabilized heavy metal sludge. Three binder materials (Portland cement, lime/fly ash, and cement/fly ash) were used to solidify/stabilize a synthetic metal plating waste sludge containing substantial concentrations of four metals (cadmium, chromium, nickel, and mercury). The effects of these interfering materials were evaluated using five physical tests: unconfined compressive strength (UCS), cone index, bulk density, wet/dry cycling, and permeability. Contaminant leaching properties were evaluated using the U.S. Environmental Protection Agency's Extraction Procedure test. Microchemical/micromorphological analyses were also performed on the treated sludges. DTIC

ENVIRONMENTAL STUDIES: MATHEMATICAL, COMPUTATIONAL AND STATISTICAL ANALYSES Final Report, 1 Jul. - 31 Dec. 1992

Avner Friedman and Willard Miller, Jr. 3 Mar. 1993 34 p
(Contract F49620-92-J-0410)
(AD-A264223; AFOSR-93-0317TR) Avail: CASI HC A03/MF A01

As we enter the final decade of the twentieth century, environmental protection has become a universal issue with world-wide support. Destruction of the stratospheric ozone-layer, global increase in carbon dioxide and other radiatively important trace gases, acid rain, urban smog, water pollution of various types, and improper disposal of toxic wastes have all been shown as pressing problems for the 1990's. Environmental studies have now bridged the realms of academic research and societal applications. Mathematical modeling and large-scale data collection and analysis lie at the core of all environmental studies. Examples of such issues are the protection of the ozone-layer, climate change, regional and urban pollution, toxic waste disposal, and water pollution. While each of these environmental problems involves extremely complex interplay of many physical, chemical, and even human interactions, mathematical analysis serves as the single unifying foundation. Because of the well-recognized highly intensive and perturbing impact of direct environmental experiments, computational models become the prevalent tool in identifying, assessing, and resolving these problems. Unfortunately, scientists, mathematicians, and engineers immersed in developing and applying environmental models, computational methods, statistical, techniques and computational hardware advance with separate and often discordant paces. The Summer Program on Mathematical, Computational, and Statistical Analyses in Environmental Studies was designed to provide a much needed interdisciplinary forum for joint exploration of recent advances in the formulation and application of (1) environmental models, (2) environmental data and data assimilation, (3) stochastic modeling and optimization, and (4) Global climate modeling. A CORRELATED k-DISTRIBUTION MODEL OF THE ATMOSPHERIC HEATING RATES FOR OVERLAPPING SPECTRA OF CO2 AND H2O
K. E. Grant and A. S. Grossman Dec. 1992 5 p
(Contract W-7405-eng-48)
(DE93-007391; UCRL-ID-112628) Avail: CASI HC A01/MF A01

The problem of overlapping the spectra of CO2 and H2O in the 0-2500 cm(sup -1) wavenumber region was considered using a correlated k-distribution model for the transmission in the atmosphere between 0 and 60 km. Individual k-distributions for the two gases were combined using an overlapping algorithm to produce k-distributions for the mixture of CO2 plus H2O. A prototype radiative transfer model was used to calculate atmospheric fluxes and heating rates. The hearing rates for the overlapped mixture agree to better than eight percent with those calculated for a single precombined mixture of CO2 and H2O. DOE

SIMULATION AND CALCULATION OF DIFFUSIVE AEROSOL DEPOSITION
C. Tien and B. V. Ramarao Oct. 1992 67 p Prepared for Lawrence Livermore National Lab., CA
(Contract W-7405-eng-48)
(DE93-007518; UCRL-CR-111779; B-160439) Avail: CASI HC A04/MF A01

A simulation method for predicting the deposition of diffusive aerosols in two dimensional flows was developed and applied to the calculation of the unit fiber efficiency in Kuwabara flow. Contrary to conventional thinking, the inertial effect may become important even for submicron aerosols under certain conditions. The commonly applied format of considering the collection efficiency as the sum of the collection efficiencies due to interception and Brownian diffusion was found inadequate in most cases although the additive principle is applicable in most cases if the inertial effect is included. It was also found that by ignoring the inertial effect, the most penetrating particle size may differ significantly from the correct value when the inertial effect is included. DOE

EVALUATION OF ENVIRONMENTAL MARKETING TERMS IN THE UNITED STATES
5 Feb. 1993 203 p Sponsored by Environmental Protection Agency, Washington, DC. Office of Pollution, Prevention, and Toxics
(Contract EPA-68-D9-0169)
(PB93-175784; EPA/741/R-92/003) Avail: CASI HC A10/MF A03

The study is a comprehensive examination of the use of environmental marketing terms in the United States as of mid-1992. Topics discussed in the report include the following: (1) issues involved in the use of environmental marketing terms; (2) consumer understanding of these terms; (3) trends in the use of environmental terms in consumer product labeling and advertising; (4) cases where environmental marketing claims have been avoided or discontinued; and (5) proposed and existing definitions of environmental marketing terms. The report was prepared in response to a call for federal action by many groups involved in environmental marketing and is designed to serve two main purposes. For state and federal policy makers seeking to promulgate guidelines or regulations governing environmental marketing terms, it provides an analytical foundation on which to base policy decisions. For those generally interested in environmental marketing, it serves as a comprehensive source of information about the major issues involved. It does not advocate a particular position or course of action. NTIS

Soils and ground water beneath the U.S. Coast Guard Air Station at Traverse City, MI, have been contaminated with separate spills of aviation gasoline and JP-4 jet fuel. Contamination from both plumes has affected a shallow water table aquifer consisting of a medium grained sand. This site has been the location of a cooperative effort between the U.S. Coast Guard and U.S. EPA to extensively characterize the site to determine the three dimensional extent of contamination, local hydrogeology, geochemistry of the solids and water, and nature of microbial activity. Evaluation concerning feasibility and cost of three innovative bioremediation techniques has also been completed at the Air Station. One evaluation demonstrated the use of hydrogen peroxide as the electron acceptor to enhance aerobic biodegradation in a portion of the aviation gasoline area. Nitrate was used as the electron acceptor for a portion of the JP-4 jet fuel contamination. Bioventing of a second portion of the aviation gasoline contamination was the third innovative technique evaluated. Each treatment reduced benzene levels to less than 5 micrograms/l, with 25% to 60% reduction in total fuel levels. For these evaluations, bioventing had the lowest capital and operating costs, followed by nitrate addition, and finally hydrogen peroxide. NTIS

N93-30823# Desert Research Inst., Reno, NV.
ENVIRONMENTAL MONITORING AND ASSESSMENT PROGRAM. EMAP: ARID COLORADO PLATEAU PILOT STUDY
S. E. Franson, ed. Jan. 1993 175 p See also PB91-141796 and PB93-100139 Prepared in cooperation with Nevada Univ.
(PB93-181618; EPA/620/R-93/001) Avail: CASI HC A08/MF A02

The 1992 Colorado Plateau Indicator Pilot Study, the first field activity for the EMAP-Arid group, is designed to evaluate several indicators of arid ecosystem condition for continued development and implementation for monitoring. This Implementation Plan describes the conceptual approach for the pilot study; questions that will be addressed in the study; the rationale and process that led to the choice of a portion of the Colorado Plateau for the study site; and the rationale and process for selection of the indicators to be tested. The overall EMAP-Arid design is presented along with the specifics for the pilot study and the sampling plot designs. Logistics, quality assurance, information management and GIS, and analysis and reporting of the pilot study results also are addressed. The bulk of the implementation plan describes the indicators that are to be evaluated in the pilot study: vegetation composition, structure, and abundance; soil properties including erosion potential; and spectral properties of vegetation and soils from both on-ground and remote sensors. An appendix describes retrospective and landscape indicators that will be further developed by EMAP-Arid in the future. NTIS

HORIZONTAL NUCLEATE FLOW BOILING HEAT TRANSFER COEFFICIENT MEASUREMENTS AND VISUAL OBSERVATIONS FOR R12, R134a, AND R134a/ESTER LUBRICANT MIXTURES

M. A. Kedzierski and M. P. Kaul Mar. 1993 34 p See also PB93-120756 Sponsored by Department of Energy, Washington, DC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB93-178598; NISTIR-5144) Avail: CASI HC A03

The paper presents a calorimetric and visual investigation of horizontal nucleate flow boiling of five different fluids: (1) dichlorodifluoromethane (R12), (2) 1,1,1,2-tetrafluoroethane (R134a), (3) R134a/1.7% proprietary polyol ester lubricant, (4) R134a/0.9% neopentyle polyol ester lubricant, and (5) R134a/2.3% neopentyle polyol ester lubricant. The calorimetric aspect of the study concentrates on the measurement of the local two-phase heat transfer coefficient (h(sub 2(phi))). The visual measurements obtained from high-speed 16 mm film of the boiling were taken simultaneously with the calorimetric measurements. The bubble diameters (D(sub b)) and the bubble density were derived from over 50 high-speed films. The purpose of the study is to provide a source of heat transfer information for the boiling of R12 and R134a/ester lubricant mixtures. Automotive and supermarket companies have begun to manufacture original air conditioning/refrigeration equipment with R134a as the operating fluid. The evaporator predominantly utilized by these industries is the in-tube heat exchanger. Naturally, designers of such evaporators require heat transfer coefficients for the horizontal flow boiling of R134a/ester mixtures. Only the nucleate flow boiling regime was investigated in the study with the aim of furthering the understanding of the fundamental heat transfer mechanisms responsible for the phenomenon. NTIS

STATEMENT ON THE UNITED NATIONS CONFERENCE ON ENVIRONMENT AND DEVELOPMENT

H. Blix Jun. 1992 5 p Conference held in Rio de Janeiro, Brazil, 1-12 Jun. 1992

(DE93-601878; INIS-MF-13356; CONF-9206148) Avail: CASI HC A01/MF A01 (US Sales Only)

Energy generation contributes greatly to environmental damage, and its impacts now pose a threat to the entire planet. The demand for energy is certain to increase in the coming decades, and the world will have to assess carefully what mix of energy sources is compatible with sustainable development and how best to use energy. The present heavy use of fossil fuels is at the root of some of the most serious environmental problems we face. Nuclear power can play an important part in combusting climate change and other energy-related problems such as urban air pollution and acid deposition. It too poses problems, such as the risk of serious accidents and the difficulties in managing radioactive wastes. The IAEA has an important role in laying down international guidelines for nuclear power plant safety and radioactive waste management. DOE

DISTRIBUTION OF C1-C2 ALDEHYDES IN THE FREE TROPOSPHERE Thesis - Cologne Univ.

D. W. Arlander, U. Schmidt, and D. H. Ehhalt Jul. 1992 135 p

(JUEL-2650; ETN-93-93806) Avail: CASI HC A07/MF A02

A sensitive and selective measurement technique for the determination of tropospheric formaldehyde and acetaldehyde in background air is described. The method is based on the derivatization of aldehydes with 2,4-dinitrol phenyl hydrazine. The derivative aldehyde hydrazones are then separated using High Performance Liquid Chromatography (HPLC) and detected at 355 nm using a conventional HPLC-UV/VIS absorbance detector. Ground level measurements for formaldehyde and acetaldehyde were shown to vary from 0.5 to 7 ppb and 0.1 to 2.0 ppb, respectively. Diurnal mean mixing ratios of formaldehyde and acetaldehyde were 2.8 +/- 1.5 ppb and 0.7 +/- 0.4 ppb, respectively. Significant diurnal patterns were observed with maximum mixing ratios in the early afternoons, and minimum mixing ratios shortly before sunrise. A potential interference from organic hydroperoxides is also discussed. Aircraft measurements showed the potential of cartridge based methods for aldehyde measurements in the free troposphere. These test flights indicated that formaldehyde vertical profiles can be dependent on inversion height and cloud frequency. In-cloud formaldehyde measurements tended to be lower than gas phase measurements. This effect is most likely due to efficient absorption of formaldehyde into the droplets followed by rapid aqueous phase oxidation. Mixing ratios of tropospheric formaldehyde and acetaldehyde were determined. Vertical profiles were obtained which yielded a characterization of formaldehyde and acetaldehyde distributions throughout the free troposphere. Above the mixing layer, aldehyde mixing ratios typically decreased with increasing altitude. Lowest values of formaldehyde were detected in the upper troposphere. At this altitude, the practical detection limit of the method is reached. Comparison of formaldehyde measurements with model results indicate that although methane is a very significant formaldehyde precursor, the inclusion of naturally emitted nonmethane hydrocarbons and possibly industrial sources are necessary in order to predict troposphere formaldehyde mixing ratios more accurately. LABORATORY SIMULATION OF FIELD-ALIGNED CURRENTS Annual Progress Report, Mar. 1992-1993
Frank J. Wessel and Norman Rostoker Mar. 1993 51 p
(Grant NAGw-2655)
(NASA-CR-193091; NAS 1.26:193091) Avail: CASI HC A04/MF A01

A summary of progress during the period Apr. 1992 to Mar. 1993 is provided. Objectives of the research are (1) to simulate, via laboratory experiments, the three terms of the field-aligned current equation; (2) to simulate auroral-arc formation processes by configuring the boundary conditions of the experimental chamber and plasma parameters to produce highly localized return currents at the end of a field-aligned current system; and (3) to extrapolate these results, using theoretical and computational techniques, to the problem of magnetospheric-ionospheric coupling and to compare them with published literature signatures of auroral-arc phenomena. MODELING LAND-SURFACE/ATMOSPHERE DYNAMICS FOR CHAMMP
W. J. Gutowski, Jr. Jan. 1993 6 p
(Contract DE-FG02-92ER-61473)
(DE93-008520; DOE/ER-61473/1) Avail: CASI HC A02/MF A01

Project progress is described on a DOE CHAMMP project to model the land-surface/atmosphere coupling in a heterogeneous environment. This work is a collaboration between scientists at Iowa State University and the University of New Hampshire. Work has proceeded in two areas: baseline model coupling and data base development for model validation. The core model elements (land model, atmosphere model) were ported to the Principal Investigator's computing system, and baseline coupling has commenced. The initial target data base is the set of observations from the FIFE field campaign, which is in the process of being acquired. For the remainder of the project period, additional data from the region surrounding the FIFE site and from other field campaigns will be acquired to determine how to best extrapolate results from the initial target region to the rest of the globe. In addition, variants of the coupled model will be used to perform experiments examining resolution requirements and coupling strategies for land-atmosphere coupling in a heterogeneous environment. (NASA-CR-193152; NAS 1.26:193152) Avail: CASI HC A03/MF A01

A case study involving data from three satellites and a ground-based radar are presented. Focus is on a detailed discussion of observations of the dynamic cusp made on 24 Sep. 1986 in the dayside high-latitude ionosphere and interior magnetosphere. The relevant data from space-borne and ground-based sensors is presented. They include in-situ particle and field measurements from the DMSP-F7 and Viking spacecraft and Sondrestrom radar observations of the ionosphere. These data are augmented by observations of the IMF and the solar wind plasma. The observations are compared with predictions about the ionospheric response to the observed particle precipitation, obtained from an auroral model. It is shown that observations and model calculations fit well and provide a picture of the ionospheric footprint of the cusp in an invariant latitude versus local time frame. The combination of Viking, Sondrestrom radar, and IMP-8 data suggests that we observed an ionospheric signature of the dynamic cusp. Its spatial variation over time which appeared closely related to the southward component of the IMF was monitored. Author (revised)

PROCEEDINGS OF THE SECOND ATMOSPHERIC RADIATION MEASUREMENT (ARM) SCIENCE TEAM MEETING
Dec. 1992 169 p Meeting held in Denver, CO, 26-30 Oct. 1991
(DE93-005886; CONF-911033-6) Avail: CASI HC A08/MF A02

The second Atmospheric Radiation Measurement (ARM) Science Team Meeting was held in Denver, CO, in Oct. 1991. The five-day meeting provided a forum for a technical exchange among the members of the ARM Science Team and a discussion of the technical aspects of the project infrastructure. The meeting included several activities: Science Team presentations, discussions of the first site occupation plan, experiment design sessions, and poster sessions. This Proceedings document includes papers presented at the meeting. The papers included are those from the technical sessions, the experiment design sessions, the first site occupation, and descriptions of locales for future sites. Individual projects are processed separately for the database. DOE

ANALYSIS OF MASS TRANSPORT AND POTENTIAL VORTICITY BUDGET IN A SIMULATED TROPOPAUSE FOLDING Ph.D. Thesis-Univ. Catholoique de Louvain
Jean-Francois Lamarque 1993 214 p Sponsored by NSF
(PB93-156792; NCAR/CT-142) Avail: CASI HC A10/MF A03

In chapter 1, after a review of the different definitions of the tropopause, an historic review of cross-tropopause mass exchange is given and the tropopause folding dynamics is explained qualitatively. In chapter 2, the authors present the regional (or meso) scale model the NCAR mesoscale model or MM4) used to simulate the tropopause fold. In chapter 3, the event they have chosen to simulate is depicted in terms of potential vorticity evolution on isentropic surface, total ozone column evolution, and three-dimensional isosurface of potential vorticity evolution. The mathematical formulation of the cross-tropopause mass exchange is presented in chapter 4. It is also applied to the particular case described in chapter 3. In chapters 5 and 6, the effect of the cross-tropopause exchange on chemical species is discussed. For these chapters, a new offline tracer transport model is developed. In chapter 5, the cross-tropopause transport of ozone is estimated. Chapter 6 applies the formalism developed in the previous chapters to proposed high flying stratospheric aircrafts as the effect of the effluents released by these planes on the stratosphere depends, to an important extent, on their residence time in the stratosphere. Finally, the conclusions and prospectives are drawn. NTIS

IONOSPHERIC STRUCTURE SPECIFICATIONS AND SYSTEMS EFFECTS
Sunanda Basu 31 Dec. 1992 35 p
(Contract F19628-90-K-0007)
(AD-A263573; PL-TR-93-2018; SR-2) Avail: CASI HC A03/MF A01

Ionospheric scintillation measurements are examined in relation to the satellite in-situ measurements of electron density structures in the ionosphere and the plasma processes responsible for the generation of these structures. Radio waves from satellites are scattered and ionospheric scintillation is recorded on the ground in the presence of a relative motion between the satellite, the ionosphere, and the observer. The electron density irregularity spectrum of extended equatorial spread F structures, generated by a Rayleigh-Taylor instability process, is found to be compatible with multi-frequency satellite scintillation measurements. In the case of equatorial bottomside sinusoidal irregularities, however, the power-law spectral index of scintillations is found to be considerably shallower than that expected.

At high latitudes, two distinct classes of plasma instabilities, namely, the gradient-drift and shear-driven instability processes are identified. The observed difference of 0.5 between the spectral indices of high latitude scintillation and in-situ irregularity spectra has been explained in the context of an anistropic irregularity spectrum. SENSITIVITY STUDY OF CLOUD/RADIATION INTERACTION USING A SECOND ORDER TURBULENCE RADIATIVE-CONVECTIVE MODEL
C. Y. J. Kao and W. S. Smith 1993 17 p Presented at the International Specialty Conference: The Role of Meteorology in Managing the Environment in the 1990s, Scottsdale, AZ, 26-28 Jan. 1993
(Contract W-7405-eng-36)
(DE93-007365; LA-UR-93-315; CONF-930140-2) Avail: CASI HC A03/MF A01

A high resolution one-dimensional version of a second order turbulence convective/radiative model, developed at the Los Alamos National Laboratory, was used to conduct a sensitivity study of a stratocumulus cloud deck, based on data taken at San Nicolas Island during the intensive field observation marine stratocumulus phase of the First International Satellite Cloud Climatology Program (ISCCP) Regional Experiment (FIRE IFO), conducted in Jul. 1987. Initial profiles for liquid water potential temperature, and total water mixing ratio were abstracted from the FIRE data. The dependence of the diurnal behavior on liquid water content, cloud top height, and cloud base height were examined for variations in subsidence rate, sea surface temperature, and initial inversion strength. The modelled diurnal variation in the column integrated liquid water agrees quite well with the observed data, for the case of low subsidence. The modelled diurnal behavior for the height of the cloud top and base show qualitative agreement with the FIRE data, although the overall height of the cloud layer is about 200 meters too high. DOE

GEOCHEMICAL AND FLUID DYNAMIC INVESTIGATIONS INTO THE NATURE OF CHEMICAL HETEROGENEITY IN THE EARTH'S MANTLE Ph.D. Thesis
Erik H. Hauri Sep. 1992 238 p
(Grant NSF EAR-87-08372)
(AD-A262753; WHOI-92-32) Avail: CASI HC A11/MF A03

Variations in the abundances of elements and radiogenic isotopes in mantle derived periodotites and volcanic rocks are chemical integrals over time, space, and process, which ultimately contain information about the role of convection in the earth's mantle in creating, maintaining, and destroying geochemical heterogeneities. Successful inversion of these integrals extensive of these integrals requires extensive knowledge of the geochemical behavior of elements, the length scales of chemical variability, the evolution with time of geologic systems, the physical properties of mantle rocks, and the driving forces of phenomena which govern heat and mass transport in a dynamic earth. This dissertation attempts to add to this knowledge by examining the trace element and isotope geochemistry of mantle periodotites and oceanic island basalts, and by studying aspects of the flow of viscous fluids driven by thermal buoyancy. We refine estimates of inner core structure by examining PKP travel times and find that anisotropy is a simpler explanation than heterogeneity for the observed residual patterns. Our preferred model of inner core anisotropy contains velocities that are 0.5% faster in a N-S direction than an E-W direction. We also studied various mantle differential travel times including SS-S, ScS-S, PP-P, and PcP-P and compare these results to those obtained from handpicked waveform data. Large-scale coherent patterns of residuals are seen which indicate mantle heterogeneity. Further, we examined PKP travel times to study the possibility of outer core heterogeneity models which are suggested by observations of anomalous splitting in normal modes. We find that the travel times limit the scale of possible outer core heterogeneity to models much smaller than those required to explain the mode splitting data. Finally, we developed computer codes which return travel time and ray geometries for a given seismic phase, source-receiver pair, and arbitrary 3-d earth models specified by their spherical harmonic expansions. SPECTRAL ENERGETICS OF THE LOWER THERMOSPHERE Ph.D. Thesis
Robert Gary Raskin 1992 198 p
Avail: Univ. Microfilms Order No. DA9308429

A spectral energetics analysis of the lower thermosphere is carried out using simulated data from the NCAR Thermosphere-Ionosphere General Circulation Model (TIGCM). The results clarify the physical processes through which upwardly propagating semidiurnal tides dissipate and release their energy into the lower thermosphere. Energy residing within the study region is partitioned into reservoirs of available potential energy, irrotational kinetic energy, and nondivergent kinetic energy at four vertical levels. A definition of available potential energy is used that is appropriate for regions of variable mean molecular weight. The reservoirs are further subdivided by vector spherical harmonic wave numbers, and an energy budget is computed for each mode. The source, sink, and transformation terms are obtained using a post-processor that reproduces the contribution of each term in the momentum and thermodynamic equations. The loss terms for the tonal wave number two modes represent the dissipating forces for the semidiurnal tides. Viscosity, heat conduction, and ion drag represent the primary dissipative forces. Numerical smoothing within the TIGCM, representing subgrid-scale diffusion, is found to have a non-negligible contribution to the tidal dissipation. A small terdiurnal tide that is excited by ion drag is also observed in the model. A sensitivity analysis is carried out to ascertain the effects of the seasonal cycles solar cycle, UT, and geomagnetic activity. At solar maximum, solar heating at the trough of the tide is an important dissipative force; the altitude of tidal dissipation is correspondingly lower. At high values of geomagnetic forcing, the propagating semidiurnal tide is completely dissipated within the study region. Dissert. Abstr.

ELECTRODYNAMICS OF THE DAYSIDE CLEFT REGION BASED ON GROUND OBSERVATIONS AT SVALBARD Final Report, Dec. 1991 - Jan. 1992
A. Egeland, J. A. Holtet, and P. E. Sandholt 20 Jan. 1993 15 p
(Grant AF-AFOSR-0082-90)
(AD-A263571; PL-TR-93-2022) Avail: CASI HC A03/MF A01

Based on extensive, diagnostic ground observations in the Svalbard region (mainly at Ny Alesund at 76 deg lambda) together with simultaneous, coordinated measurements from Greenland and Heiss Island spanning - 4 hours in magnetic local time - together with the EISCAT radars as well as DMSP satellite-recordings, essential information on the dynamics of the dayside cleft and polar cap region (auroral, ionospheric, and electric field) have been obtained. This is an important prerequisite to the understanding of the physics of the dayside boundary layers. Several papers have been presented and many lectures given related to this program. Possible generation mechanisms of dayside cusp/cleft auroras including magnetic merging, external pressure pulses, Kelvin-Helmholtz-instabilities, and dynamo processes by intruding plasma elements are discussed. To determine the characteristic auroral signatures of these boundary layer processes is a major objective of these studies. DTIC

MODELING EARTHQUAKES WITH LOCAL AND REGIONAL BROADBAND DATA Ph.D. Thesis
Douglas Scott Dreger 1993 215 p
Avail: Univ. Microfilms Order No. DA9307034

Waveform modeling techniques were applied to several recent, moderate sized earthquakes recorded by the broadband, high dynamic range TERRAscope array in southern California. A method for the determination of source parameters at regional distances with three-component, sparse network data is developed, and applied to several events that occurred both within and outside the array. In some cases only the data from a single, three-component station was required to recover the source parameters. The source characteristics of the 1990 Upland mainshock (M(sub l) = 5.2) were investigated utilizing the broadband data recorded by the Pasadena station of the TERRAscope array. Green's functions developed by forward-modeling the waveforms of two smaller earthquakes that occurred in the Upland source region in 1988 were used in the analysis. Comparisons of the 1990 mainshock with the 1988 events revealed that the mainshock source was relatively complicated. Multi-point source and distributed finite slip models show that the mainshock ruptured down dip (6 km to 9 km) with a non-uniform slip distribution in which 30 percent of the total seismic moment was released from a relatively small area at 9 km depth. The overall area of the mainshock was found to be significantly smaller than the aftershock zone. The source process of the 28 Jun. 1991 Sierra Madre earthquake (M(sub L) = 5.8) is investigated using the broadband data recorded at 6 TERRAscope stations. Ratios of the peak amplitudes of simulated short-period and long-period Wood-Anderson seismograms show that stations southwest of the epicenter have elevated levels of short-period energy relative to stations to the east suggesting the presence of source directivity. The displacement waveforms were forward modeled using distributed finite slip models. The best fitting model consists of an up dip rupture toward the west. This model fails however to explain the amplitudes of the short-period waves. A non-uniform slip model was developed that better explains the short-period amplitudes. The results of this analysis indicate that the shorter-period energy is controlled more by the patches on the fault that experience the greatest slip, rather than the accumulative motions due to slip on the whole fault surface. Dissert. Abstr.

DAILY SUM OF THE GLOBAL RADIATION: CALCULATION METHOD AND VERIFICATION OF FORECAST [DAGSOM VAN DE GLOBALE STRALING: EEN REKENMETHODE EN VERWACHTINGSVERIFICATIE]
M. C. Nolet 1991 17 p In DUTCH
(KNMI-TR-138; ISBN-9-03-692007-8; ETN-93-93588) Copyright Avail: Royal Netherlands Meteorological Inst., PO Box 201, 3730 AE De Bilt, Wilhelminalaan 10, Netherlands

The daily global radiation was calculated and compared with observations. It was calculated from the hourly averages deduced from the elevation of the Sun and the cloud cover. The calculated daily sums are on the average somewhat higher than the observed ones, and have to be slightly corrected. The correlation coefficient between calculated and observed daily sums is very high (0.98). The forecast of the daily sum of the global radiation (i.e. of the cloud cover degree) is difficult. The correlation coefficient between expected and real daily sum varies from 0.62 to 0.88, and the average absolute error is about 13% of the maximum possible daily sum. ESA

LABORATORY STUDIES OF GRAVITY WAVE/MEAN FLOW INTERACTIONS Annual Report, 15 Nov. 1991 - 14 Nov. 1992
Donald P. Delisi 4 Mar. 1993 32 p
(Contract F49620-92-C-0005)
(AD-A264226; NWRA-CR-92-R095; AFOSR-93-0265TR) Avail: CASI HC A03/MF A01

Progress is reported on laboratory measurements of gravity wave/critical layer interactions. Previous results have been reported for the interactions of single monochromatic waves propagating in a stratified fluid with a vertical velocity shear. The new results presented here are for two monochromatic forcing waves, each propagating with a different phase speed. Thus, the critical layer for each wave is distinct in the vertical. The results for the two-wave case are compared to similar results for the one-wave case. In the one-wave case, only weak overturning appeared in the upper part of the tank for interaction times longer than about 13 minutes, and regular, periodic turbulence was observed in the lower part of the tank. In contrast, in the two-wave case, sustained overturning was observed in the upper part of the tank and packets of turbulence were seen in the lower part of the tank. Velocity profiles are currently being examined to attempt to understand these observed differences. Other improvements in the hardware and software of the facility are also reported, and plans for the coming year are discussed. DTIC

NUMERICAL MODELING AND PARAMETERIZATION OF GRAVITY WAVE PROCESSES AND EFFECTS IN THE ATMOSPHERE Annual Report, 1 Jan. - 31 Dec. 1992
David C. Fritts 31 Dec. 1992 5 p
(Contract F49620-92-J-0138)
(AD-A264331; AFOSR-93-0262TR) Avail: CASI HC A01/MF A01

A nonlinear, compressible, spectral collocation code was developed to examine gravity wave breaking and instability processes in two and three spatial dimensions. Initial studies demonstrated that the preferred mode of instability within a high-frequency gravity wave is a convective instability comprised of counter-rotating vortices aligned transverse to the direction of wave propagation (a horizontal wavenumber normal to that of the gravity wave). Thus, wave instability is inherently three-dimensional, and two-dimensional models are unlikely to adequately describe either the physics of wave breaking or the implications for wave transports and eddy mixing. A parallel effort emphasized the statistical effects of wave interactions and dissipation processes and developed a new spectral parameterization of gravity wave transports of energy and momentum and their atmospheric effects. This scheme relies on the approximately universal spectral shape of the gravity wave motion field throughout the atmosphere to assess the potential for wave transports and variations with background wind and stability profiles. A COMPUTER SIMULATION OF THE PRODUCTION OF AN ARTIFICIALLY IONIZED LAYER USING THE ARECIBO FACILITY
G. M. Milikh, J. M. Hinds, and L. M. Duncan (Clemson Univ., SC.) 1993 46 p
(Contract W-7405-eng-36)
(DE93-010817; LA-Sub-93-152) Avail: CASI HC A03/MF A01

A computer model simulating the formation of an artificially ionized layer in the atmosphere by a series of microwave pulses was developed and is presented. The approach utilizes possible opportunities offered by the existing Arecibo transmitter and antenna. A modified version of the kinetic theory of the breakdown of air by a powerful microwave emission was incorporated into a model of electromagnetic propagation through the atmosphere by a converging ionizing microwave pulse. This model takes into consideration radio wave self-action as well as absorption, and produces profiles of electron concentration formed in the atmosphere by both an isolated pulse and a series of pulses. Effects of varying the shape of the ionizing pulse are considered as well as the influence of the ambient electron concentration. Also, the dependence of the electron concentration on the energy and duration of the pulse is investigated. The possible increase in the rate of electron production is considered when using an intense pulse to initiate the breakdown followed by a series of pulses of lesser energy. The influence of the refraction of the microwave beam is estimated. The computer model presented shows that an AIL (Artificial Ionized Layer) of electrons reaching concentrations on the order of 10(sup 8) cm(sup -3) could be formed over a height range of 40-70 km, if the Arecibo antenna and radio facility were reconfigured so that it would be able to generate microwaves with f = 2.38 GHz and a power of approximately 1-4 MW. In addition, a pulse compressor would be used to form pulses with durations of approximately 0.1-0.15 (mu)s with a repetition frequency of 103 Hz. DOE

MITHRAS STUDIES OF THE BOUNDARY BETWEEN OPEN AND CLOSED FIELD LINES Annual Report, 1 Dec. 1991 - 30 Nov. 1992
Odile DelaBeaujardiere Mar. 1993 9 p
(Contract F49620-92-C-0011)
(AD-A264758; AFOSR-93-0243TR) Avail: CASI HC A02/MF A01

The coupling between the solar wind, the magnetosphere, and the ionosphere was studied using data from multi-instrument campaigns. One study showed that, even under quiescent conditions, the polar cap boundary was quite active. Repeated disturbances in particle precipitation and the electric field were observed at intervals of 10 to 20 minutes. Some of these perturbations propagated westward at a velocity of around 1000 m/s. It was argued that these perturbations are the ionospheric signature of rapid increases in the midnight-sector magnetic reconnection. In a separate study, the transition from active to quiet conditions was examined. The interplanetary magnetic field northward component switched suddenly from a northward to a southward orientation. The ionosphere responded within about two minutes: the electric field intensity diminished, and the F-region large and small scale irregularities changed dramatically. This response time is much shorter than had previously been assumed. DTIC

N93-30564 Michigan Univ., Ann Arbor.
OBSERVING AND MODELLING F-REGION IONOSPHERIC DYNAMICS USING THE OII 7320A EMISSION Ph.D. Thesis
Stephen Scott Carr 1992 328 p
Avail: Univ. Microfilms Order No. DA9308284

Limb-scan observations of Doppler line profiles from the (OII) lambda 7320A emission at F-Region altitudes, made with the Fabry-Perot interferometer (FPI) on the Dynamics Explorer-2 (DE-2) spacecraft, were analyzed to provide measurements of the meridional component of the ion convection velocity along the instrument line-of-sight. The DE-2 results presented demonstrate the first spaceborne use of the remote-sensing Doppler technique for measurements of ionospheric convection. The FPI meridional ion drift measurements were compared with nearly simultaneous in situ ion drift measurements from the Retarding Potential Analyzer (RPA) on DE-2. Once allowance is made for the temporal lag between the in situ and remove measurements, the results from the two techniques are found to be in good agreement, within specified experimental errors, giving confidence in the FPI measurements. The spaceborne interferometric technique has future utility for 2-dimensional imaging of polar ionospheric convection. Results from a simulated space-based observing platform, based on the DE-2 technique and an extension of a 7320A aeronomical model, are presented to demonstrate that a large fraction of the entire polar ionospheric convection pattern can be monitored from space during approximately 16-minute polar passes of a suitably-instrumented satellite. In the simulation, the polar-orbiting satellite's FPI system views the 7320A emission at various tangent point altitudes at +/- 45 deg and +/- 135 deg to the satellite velocity vector. By adjusting the horizon scan angle, several swaths of vectors at different horizontal spacing from the satellite can be recovered. Doppler line profiles from the (OII) 7320A emission at F-Region altitudes, made with the FPI at Sondre Stromfjord, Greenland, were analyzed to provide ion drift vectors and temperatures. These measurements demonstrate a unique ground-based use of the remote sensing technique from within the auroral zone since they are compared to simultaneous incoherent scatter radar (ISR) measurements. Results from the two techniques are in reasonable agreement, within specified instrumental errors, giving confidence in ground-based FPI measurements of the high-latitude ionospheric convection pattern and temperature field. Dissert. Abstr.

A physics-based analytic model of the ionospheric effects of low-altitude nuclear explosions due to acoustic-gravity waves (AGW) is produced. The model contains the essence of AGW theory predictions while including basic atmospheric chemistry effects to allow descriptions of AGW induced changes for both nighttime and daytime ionospheres. The model allows multiple explosions at arbitrary times and locations although its experimental basis is, of course, from single explosion data. DTIC

MODELING REGIONAL SEISMIC WAVES
Donald V. Helmberger and David G. Harkrider 29 Jun. 1992 115 p
(Contract F19628-90-K-0049)
(AD-A264002; PL-TR-92-2186; SR-1) Avail: CASI HC A06/MF A02

This research performed under the contract, during the period 26 Sep. 1990 through 25 Sep. 1991, can be divided into two main topics; determining compressional velocity by modeling waveforms and travel time data from long-period and short-period recordings and determining surface wave magnitudes for NTS events using regional data. In section 1, a compressional velocity model for the northwest Atlantic Ocean was derived by modeling wave form and travel time data from long-period and short-period WWSSN and Canadian network station recordings. A ninety kilometer thick lid with the velocity of 8.1 km/sec at the top gradually changing to 8.3 km/sec at the bottom is obtained by fitting the travel time data of first arrivals and waveform data of pure oceanic paths at distance of 8 - 20 degrees. Triplication P waveform data constrains the structure below the lid. A distinct low velocity zone is located at depth of about 170 km. Combining with the shear wave structure derived by Grand and Helmberger for the same region, we can infer a very oliving-rich mineralogy in the upper 100 km and a very garnet-rich mineralogy at the depth of 200 - 400 km, at which partial melting should be also responsible for the very high VP/VS ratio. In section 2, the use of surface wave magnitudes as a determination of yield of under-ground explosions and the associated magnitude-yield scaling relationship was re-examined. Surface wave magnitudes for 190 Nevada Test Site (NTS) underground nuclear explosions were calculated from a data set of regional long-period seismograms from a combined super-network of 55 North American stations. Great effort went towards making the data set comprehensive and diverse in terms of yield, source location, and shot medium in order to determine the portability of surface wave magnitude scales. GENERAL SCALAR-TENSOR THEORIES FOR INDUCED GRAVITY INFLATION
H. BoutalebJ (Mohammed V Univ., Rabat, Morocco.) and A. L. Marrakchi Jul. 1992 17 p
(DE93-602505; IC-92/132) Avail: CASI HC A03/MF A01 (US Sales Only)

Some cosmological implications of a general scalar-tensor theory for induced gravity are discussed. The model exhibits a slow-rolling phase provided that the coupling function epsilon(phi) varies slowly enough such that (phi) dl(n)(epsilon)(phi)/d(phi) much less than 2 during almost the inflationary epoch. It is then shown that, as in the ordinary induced gravity inflation, the chaotic scenario is more natural than the new scenario which proves to be even not self-consistent. The results are applied, for illustration, to a scalar-tensor theory of the Barker type. DOE

The 'Electron' scientific apparatus complex, which was designed for experimentation with electron beam injection from space vehicles, is described. The complex is comprised of an electron injector with a high-frequency modulator, a set of board diagnostic equipment, and three ejection diagnostic containers. Results of an experiment on the modulated electron beam interaction (0.5A current and 6.5-8 keV energy) with ionospheric plasma at 90-150 km altitudes are presented. Energy spectra of recurrent electrons and ions arriving at a meteorocket are presented. DOE

ATMOSPHERIC STUDIES WITH SODAR AT KALPAKKAM

K. M. Somayaji 1991 70 p

(DE93-605544; IGC-125) Avail: CASI HC A04/MF A01 (US Sales Only)

A Doppler SODAR for measurement of wind characteristics at different heights has been installed at HASL, IGCAR, Kalpakkam and has been in operation since Jan. 1990. The technical specifications and the basic aspects of SODAR, siting considerations, and installation details are given. The report also discusses some observations regarding the site selection, installation, and operation of SODAR's. The basic theory of SODAR's, some aspects of turbulence and dispersion in atmosphere, and the various stability classification schemes are outlined. Some details regarding land/sea-breeze circulations and inversions are also given. DOE

A NON DEGENERATE SEMI-CLASSICAL LAGRANGIAN FOR DILATON-GRAVITY IN TWO DIMENSIONS

N. Mohammedi May 1992 13 p

(DE92-641339; IC-92/73) Avail: CASI HC A03/MF A01 (US Sales Only)

An action for two dimensional gravity conformally coupled to two dilaton-type fields is analyzed. Classically, the theory has some exact solutions. These include configurations representing black holes. A semi-classical theory is obtained by assuming that these singular solutions are caused by the collapse of some matter fields. The semi-classical equations of motion reveal then that any generic solution must have a flat geometry. DOE

CHARACTERIZATION OF LABORATORY GENERATED TURBULENCE BY OPTICAL PHASE MEASUREMENTS M.S. Thesis

Eric P. Magee 23 Mar. 1993 174 p

(AD-A262596; AFIT/GEO/ENG/93M-03) Avail: CASI HC A08/MF A02

The resolution achieved by an optical imaging system in the presence of the random effects of the atmosphere is severely degraded from the theoretical diffraction limit. Techniques exist for recovering near diffraction limited performance of an imaging system in the presence of atmospheric turbulence. As opposed to laboratory testing, testing image enhancement techniques in the Earth's atmosphere imposes many limitations. Unfavorable weather conditions could result in the loss of time and money invested in conducting the experiments. With a properly characterized turbulence generator, with statistics that match those of the atmosphere, experimental testing of image enhancement techniques can be conducted in a controlled laboratory environment. A turbulence chamber has been designed and built for laboratory testing of current and future adaptive optics and image enhancement techniques. The turbulence is produced within a chamber consisting of two small fans and a heating element. A unique method of characterizing the statistics of the turbulence has been developed. The wavefront phase perturbations are measured using a shearing interferometer. The statistical properties of the turbulence are then characterized by estimating the phase structure function from the wavefront phase measurements. The phase structure function is a measure of the correlation of the phase between two points in a plane perpendicular to the direction of propagation. It has been found that the estimate of the phase structure function depends only on the magnitude of the separation between the spatially separated points, and follows the Kolmogorov r(5/3) power law. DISCHARGE OF ELECTRICALLY CHARGED CLOUDS Final Report, Sep. 1990 - Sep. 1992

Jean-Claude Diels, Xin M. Zhao, Chao-Yuen Yeh, and Cai Y. Wang 26 Oct. 1992 29 p

(Contract F19628-90-K-0056)

(AD-A263212; PL-TR-92-2266) Avail: CASI HC A03/MF A01

In a one year program, we have established a new mechanism for triggering lightning using low energy (less than 1 mJ) ultrashort (subpicosecond) pulses. A pre-ionized 'needle-shaped' path is created by three to four photon ionization of oxygen or applied field results in a local enhancement of the field, sufficient to reach avalanche breakdown. Measurement of multiphoton ionization cross section have established that a few mJ/sq cm in 200 fs at 248nm are sufficient to create 1013 electrons/cc. Laser induced discharge of 90 KV over 25 cm have been demonstrated with ns pulses at 248 nm, at pressure of 1/7 atm. This result and the theory indicate that less than 1 mJ in less than 1 ps duration pulses at 248 nm should induce the discharge at atmospheric pressure. A fs laser oscillator-amplifier has been assembled to perform such tests. DTIC

AN AUTOMATED OBSERVING SYSTEM FOR PASSIVE EVALUATION OF CLOUD COVER AND VISIBILITY Final Report, Sep. 1988 - Jan. 1992

J. E. Shields, R. W. Johnson, and M. E. Karr Jul. 1992 40 p
(Contract F19628-88-C-0154)
(AD-A263207; SIO-REF-92-22; MPL-U-65/92; PL-TR-92-2202; XC-PL/HANSCOM) Avail: CASI HC A03/MF A01

The Automated Observing System is a passive system for determination of cloud cover and sector visibility. This system was developed from related systems, the Whole Sky Imager for cloud field assessment, and the Horizon Scanning Imager for determination of the sector visibility. During the past funding interval, much of the effort on this system was directed toward development of night visibility capability. This report discusses the theoretical development of the equations and analytic approaches to night visibility. A variety of hardware and software adaptations are discussed, which allow the sensor to utilize multiple integration periods for increased system sensitivity. Sample results are included. Secondary developments discussed in this report include an in-depth sensitivity analysis of the daytime visibility system, as well as achievement of more accurate cloud algorithms and night cloud capability funded separately. This is followed by recommendations for improvements to tile current system, and for development of tactical systems based on the existing capability. DTIC

LEADEX DATA REPORT. PART 1: WEATHER ANALYSIS AND SATELLITE IMAGES Final Report, 25 Mar. - 24 Apr. 1992

Robert W. Fett, Thomas F. Lee, Warren W. Rodie, Stephen D. Burk, and William T. Thompson Dec. 1992 309 p
(DA Proj. 3103)
(AD-A263217; NRL/PU/7531-92-0003) Avail: CASI HC A14/MF A03

This document contains weather analyses, forecast products, and selected satellite images obtained during the Leads Experiment (Leadex) from 25 Mar. - 24 Apr. 1992. This NRL Publication is Part 1 of a two-part data compilation report. Part 2 contains daily rawinsonde data obtained at Deadhorse and at the ice camp, and buoy data from four buoys surrounding the ice camp. A special section of Part 1 introduces the European spacecraft ERS-1 Synthetic Aperture Radar (SAR) data and shows some of the unique images from this sensor--courtesy of the European Space Agency (ESA). The report affords an opportunity to compare SAR data over selected locations with visible and infrared data from the DMSP satellite, with microwave imager (SSM/I) data from the same satellite, and with multispectral images from the NOAA satellite system. Special mesoscale weather depictions over the Leadex area, derived from the Navy's Second Order Closure Mesoscale Model (SOCMM), are shown for each day of the experiment. DTIC

THE METEOROLOGICAL DATABASE Interim Report

S. A. Stage, J. V. Ramsdell, C. A. Simonen, and K. W. Burk Jan. 1993 70 p
(Contract DE-AC06-76RL-01830)
(DE93-007289; PNWD-2090-HEDR) Avail: CASI HC A04/MF A01

The Hanford Environmental Dose Reconstruction (HEDR) Project is estimating radiation doses that individuals may have received from operations at Hanford from 1944 to the present. An independent Technical Steering Panel (TSP) directs the project, which is being conducted by the Battelle, Pacific Northwest Laboratories in Richland, Washington. The goals of HEDR, as approved by the TSP, include dose estimates and determination of confidence ranges for these estimates. The current status of the meteorological database is described. The meteorological data available for use in climate model calculations, the data collection procedures, and the preparation and control of the meteorological database are described. An initial assessment of the data quality is provided. The available meteorological data are adequate for atmospheric calculations. Initial checks of the data indicate the data entry accuracy meets the data quality objectives. DOE

DOPPLER-RADAR WIND-SPEED MEASUREMENTS IN TORNADOES: A COMPARISON OF REAL AND SIMULATED SPECTRA

H. B. Bluestein (Oklahoma Univ., Norman.), J. G. LaDue (Oklahoma Univ., Norman.), H. Stein (Oklahoma Univ., Norman.), D. Speheger (Oklahoma Univ., Norman.), and W. P. Unruh 1993 4 p Presented at the Radar Meteorology Meeting, Norman, OK, 24-28 May 1993
(Contract W-7405-eng-36)
(DE93-008734; LA-UR-93-639; CONF-9305139-1) Avail: CASI HC A01/MF A01

Bluestein and Unruh have discussed the advantages of using a portable Doppler radar to map the wind field in tornadoes. During the spring of 1991, a storm-intercept team from the University of Oklahoma (OU) collected data near five supercell tornadoes in Oklahoma and Kansas. Details about the 1-W, 3-cm, 5-deg half-power beamwidth, CW/FM-CW Doppler radar we used and the methods of data collection and analysis are found in Bluestein and Unruh and Bluestein et al. Using the portable radar, we approximately doubled in only one year the number of tornado spectra that had been collected over a period of almost 20 years by NSSL's fixed-site Doppler radar. In this paper, we will compare observed tornado wind spectra with simulated wind spectra (Zmic and Doviak 1975) in order to learn more about tornado structure. DOE

RHODE ISLAND HURRICANES AND TROPICAL STORMS: A FIFTY-SIX YEAR SUMMARY, 1936-1991

David R. Vallee (National Weather Service, Providence, RI.) Mar. 1993 70 p
(PB93-162006; NOAA-TM-NWS-ER-86) Avail: CASI HC A04/MF A01

The paper was compiled to provide a general overview of all tropical cyclone activity near Rhode Island since 1936. The year of 1936 is arbitrary, chosen mainly to include a not so well known system prior to the well documented Great New England Hurricane of 1938. Thirty-one such storms have affected the state in the past 56 years, either making landfall along the coast of southern New England, or passing close enough over the offshore waters to spread tropical storm or hurricane force conditions into the area. The intensities of these systems have ranged from weak, disorganized tropical storms to full fledged major hurricanes. The one feature common to almost all of the storms was a rapid acceleration toward Rhode Island, which greatly reduced the time to prepare and evacuate. NTIS

PROGNOSTIC CLOUD WATER IN THE LOS ALAMOS GENERAL CIRCULATION MODEL

J. E. Kristjansson and C. Y. J. Kao 1993 8 p Presented at the International Specialty Conference: The Role of Meteorology in Managing the Environment in the 1990s, Scottsdale, AZ, 26-28 Jan. 1993
(Contract W-7405-eng-36)
(DE93-007381; LA-UR-93-201; CONF-930140-3) Avail: CASI HC A02/MF A01

Most of today's general circulation models (GCM's) have a greatly simplified treatment of condensation and clouds. Recent observational studies of the earth's radiation budget have suggested cloud-related feedback mechanisms to be of tremendous importance for the issue of global change. Thus, there has arisen an urgent need for improvements in the treatment of clouds in GCM's, especially as the clouds relate to radiation. In the present paper, we investigate the effects of introducing pregnostic cloud water into the Los Alamos GCM. The cloud water field, produced by both stratiform and convective condensation, is subject to 3-dimensional advection and vertical diffusion. The cloud water enters the radiation calculations through the long wave emissivity calculations. Results from several sensitivity simulations show that realistic cloud water and precipitation fields can be obtained with the applied method. Comparisons with observations show that the most realistic results are obtained when more sophisticated schemes for moist convection are introduced at the same time. The model's cold bias is reduced and the zonal winds become stronger, due to more realistic tropical convection. DOE

THE SENSITIVITY OF AGEOSTROPHIC CIRCULATIONS TO MODEL RESOLUTION: A CASE STUDY USING NGM FORECASTS OF ERICA IOP-4 M.S. Thesis

James Berdeguez Dec. 1992 144 p
(AD-A262011) Avail: CASI HC A07/MF A02

The effect of model resolution on the ageostrophic circulations and dynamics of a rapidly deepening extratropical cyclone that occurred during the Intensive Observing Period (IOP) 4 (4-5 January 1989) of the Experiment on Rapidly Intensifying Cyclones over the Atlantic (ERICA) is examined using the psi-vector technique proposed by Keyser et al. (1989). A comparison of forecasts made by the National Meteorological Center's Nested Grid Model (NGM) using operational (C-grid) and double-resolution (D-grid) versions indicated central pressure and frontal evolution differences between the two forecasts IW IOP-4 cyclone was observed to deepen by 60 mb in 24 h to a central pressure of 936 mb. The NGM C-grid forecast attained a central pressure at 0000 UTC 5 Jan. of 959 mb, while the D-grid forecast attained a central pressure of 949 mb. Differences in the laterally coupled jet streaks between the C- and D-grid forecasts enabled the D-grid forecast to depict stronger transverse ageostrophic circulations that produced stronger ascent and greater spin-up of the low-level cyclone. EVALUATION OF ATMOSPHERIC WIND FIELD AND DISPERSION MODELS FOR FOG-OIL SMOKE DISPERSION IN COMPLEX TERRAIN: FIELD MEASUREMENT AND MODEL EVALUATION PROGRAM FOR ASSESSMENT OF THE ENVIRONMENTAL EFFECTS OF MILITARY SMOKES Final Report

D. M. Maloney, A. J. Policastro, W. E. Dunn (Illinois Univ., Urbana-Champaign.), and D. F. Brown (Illinois Univ., Urbana-Champaign.) Jul. 1992 107 p
(DA Proj. 3E1-62720-A-835)
(AD-A262051) Avail: CASI HC A06/MF A02

Three models used to predict the wind field and pollutant dispersion in complex terrain are compared with smoke dispersion data acquired as part of the AMADEUS field experiments in 1987 near Red Bluff, California. The models evaluated were WADOCT, HOTMAC/RAPTAD, and RAMS. The data base for model testing encompassed 7 fog-oil smoke releases from ground level under stable meteorological conditions. Smoke concentrations were measured out to 4 km downwind. Time-dependent meteorological and source data were available from these tests to be used as model input. The results showed that the WADOCT model predicted quite well for the first 300 m downwind but then underpredicted the plume concentration by an order of magnitude at distances of 4 km downwind. The HOTMAC/RAPTAD model revealed a similar behavior. The inability of those two models to predict the trajectory of the plume and the observed limited vertical growth of the plume, in the downwind valley, are the likely causes of the underprediction. The RAMS model revealed very poor wind field and dispersion predictions based on the large grid spacing that was required (for this application) in order to make the computer run times manageable. CONVECTIVE AND STRATIFORM RAIN: MULTICHANNEL MICROWAVE SENSING OVER OCEANS

C. Prabhakara, J. J. Nucciarone (Hughes STX, Inc., Lanham, MD.), and G. Dalu (Consiglio Nazionale delle Ricerche, Cagliari, Italy.) Washington Jun. 1993 44 p
(NASA-TM-104586; Rept-93B00084; NAS 1.15:104586) Avail: CASI HC A03/MF A01

Measurements made by the Special Sensor Microwave/Imager (SSM/I) radiometer over the oceans, at 19, 37, and 85 GHz in dual polarization, are used to develop a model to classify rain into light-stratiform, moderately convective, and heavy convective types in the mesoscale convective systems (MCS). It is observed that the bulk of the 19- and 37-GHz data are linearly correlated with respect to one another, and generally increase together in brightness as the mean rain rate in the field of view (FOV) of the radiometer increases. However, a significant fraction of the data from these channels departs from this linear relationship, reflecting the nonuniform rain that is convective vs. the relatively light stratiform rain. It is inferred from the SSM/I data, in a MCS, when the slope dT sub 3/dT sub 19 is greater than unity there are optically thin clouds which produce light uniform rain. On the other hand, when dT sub 3/dT sub 19 is close to unity, the rain cells have an open structure and correspond to the convective type of rain. The openings between the cells are apparently a result of the downdrafts and/or entrainment. Relatively low values of 85-GHz brightness temperatures that are present when dT sub 37/dT sub 19 is close to unity support these views and, in addition, leads us to conclude that when the convection is heavy this brightness temperature decreases due to scattering by hydrometeors. On the basis of this explanation of the SSM/I data, an empirical rain retrieval algorithm is developed. Radar backscatter observations over the Atlantic Ocean next to Florida are used to demonstrate the applicability of this method. Three monthly mean maps of rainfall over the oceans from 50 degrees N to 50 degrees S, are presented to illustrate the ability of this method to sense seasonal and interannual variations of rain. THUNDERSTORM FORECAST STUDY FOR EGLIN AFB, FLORIDA
Daniel Comell Mar. 1993 48 p
(AD-A263423; USAFETAC/PR-93/001) Avail: CASI HC A03/MF A01

This report describes the evaluation of an empirical technique (WINNDEX) for predicting air-mass thunderstorms at Eglin AFB, FL. Results showed that the WINNDEX objective forecast technique had a Heidke skill score of .18 in predicting thunderstorm activity on the Eglin Range complex. A discriminant analysis model was developed that improved this skill to .32 in predicting the occurrence of thunderstorms during four 3-hour periods beginning at 1200Z. The study demonstrates the utility of USAFETAC's lightning database in developing and verifying a thunderstorm forecast model for remote locations. DTIC

WIND MEASUREMENT ACCURACY OF A LORAN RADIOSONDE
James F. Morrissey 26 Oct. 1992 26 p
(AD-A263572; PL-TR-92-2262; ERP-1110) Avail: CASI HC A03/MF A01

A comparison of winds obtained using a Loran radiosonde system developed at Phillips Laboratory and winds derived using radar tracking of targets attached to the radiosonde balloon train are presented. The tests involve 10 ascents with dual Loran ground stations on most flights and dual radar tracking on two flights. The tests were performed at the Goddard Space Flight Center/Wallops Flight Facility in June 1990. The radiosonde is sufficiently accurate (0.32 m/s) to evaluate a wind profiler that has an error budget of 1.0 m/s. The wind profiler has been proposed to satisfy day of launch missile range wind measurement requirements. DTIC

THE BASICS OF WEATHER MODELS
W. D. Meyer Mar. 1993 15 p
(AD-A263386; AWS/FM-93/001) Avail: CASI HC A03/MF A01

Without using mathematics, the important information weather forecasters need to know to apply numerical weather prediction (NWP) forecasts are summarized. Some tough choices regarding what material to include were made. The more technically rigorous information was put in an appendix. The material is organized under three main topics: history of NWP, components of an NWP model, and strengths and weaknesses of NWP models. Author (revised)

CLOUDIEST YEAR STUDY: AN ANALYSIS OF THE 3DNEPH AND RTNEPH DATABASES
Billy D. Bainter Apr. 1993 25 p
(AD-A263409; AWS/PR-93/004) Avail: CASI HC A03/MF A01

Nephanalysis data from the Air Force Global Weather Central's (AFGWC's) two nephanalysis models (3-Dimensional Nephanalysis, or 3DNEPH, and Real-Time Nephanalysis, or RTNEPH) has been archived by USAFETAC's Operating Location A at Asheville, NC, since 1973. It has been used and applied by USAFETAC analysts since the data became part of the Air Weather Service's overall operational database. USAFETAC is frequently asked how one year's nephanalysis data compares with another in terms of global cloudiness. Up to now, that question has not been answered because of the immensity of the 3DNEPH and RTNEPH databases. But by combining new technologies with a scheme to reduce data volume, USAFETAC/DOS was recently able to rank data by years and months to determine the existence or non-existence of so-called 'cloudiest' periods. The study, the results of which are documented, used 3DNEPH and RTNEPH data from 1977 to 1991 to determine the years and months with maximum mean total cloudiness. DTIC

SURFACE SHEAR STRESS ESTIMATES FROM GEOSTROPHIC WINDS FOR USE IN SENSIBLE AND LATENT HEAT FLUX FORMULATIONS Ph.D. Thesis
Richard D. Crago 1993 251 p
Avail: Univ. Microfilms Order No. DA9309552

The surface shear stress (or friction velocity, u(sub *)) is found in many formulations for evapotranspiration (LE) and sensible heat flux (H) from land surfaces, but is difficult to estimate without actually measuring wind speeds. ABL (Atmospheric Boundary Layer) similarity theory is used to estimate u(sub *) from the geostrophic wind (i.e., from the atmospheric pressure field). Atmospheric pressure is routinely measured at most weather stations across many continents on an hourly basis. Data from the First ISLSCP (International Satellite Land Surface Climatology Project) Field Experiment (FIFE) were analyzed. The values of the similarity variables B and B(sub W) were determined, and several formulations for the variables were compared. The optimal formulation (i.e., the one which produced the best match with the reference u(sub *) values obtained from surface layer similarity) used the magnitude (G) of the geostrophic wind and a stability-dependent B(sub W) function. The effects of random errors, baroclinicity, and inertial effects on the results were analyzed. Random measurement errors and the omission of inertial effects in the optimal formulation may cause considerable scatter. No dependence of the similarity variables on baroclinicity or scale-height ratio was discernable amidst the scatter, but they may still at times be important. Contrary to the findings of Hasse and Wagner, no tendency was found in the low wind speed range for near surface wind speeds to be greater than geostrophic wind

speeds. The geostrophic drag coefficient (i.e., u(sub *)/G) did not vary with stability or baroclinicity; a constant value of 0.1006 (for z(sub 0) = 1.05 m) gave unbiased estimates of u(sub *) and a higher correlation with the reference values than the optimal ABL similarity formulation. Estimates of H and LE using ABL similarity for temperature, the surface energy budget for LE, and the optimal B(sub W) formulation for u(sub *) gave correlations with values measured at the surface wing the Bowen-ratio with energy-budget method of 0.73 and 0.92, respectively. ABL similarity with measured winds provided better estimates, but is less applicable for widespread use in hydrology. Reduction of measurement error and incorporation of accurate acceleration estimates could improve results.

A STOCHASTIC FORMATION OF RADIATIVE TRANSFER IN CLOUDS

G. L. Stephens and P. M. Gabriel Mar. 1993 23 p
(Contract DE-FG02-90ER-61067)
(DE93-011372; DOE/ER-61067/2) Avail: CASI HC A03/MF A01

The research carried out under this award dealt with issues involving deterministic radiative transfer, remote sensing, Stochastic radiative transfer, and parameterization of cloud optical properties. A number of different forms of radiative transfer models in one, two, and three dimensions were developed in an attempt to build an understanding of the radiative transfer in clouds with realistic spatial structure and to determine the key geometrical parameter that influence this transfer. The research conducted also seeks to assess the relative importance of these geometrical effects in contrast to microphysical effects of clouds. The main conclusion of the work is that geometry has a profound influence on all aspects of radiative transfer and the interpretation of this transfer. We demonstrate how this geometry can influence an estimate of the particle effective radius to the 30-50% level and also how geometry can significantly bias the remote sensing of cloud optical depth.

NEURAL NETWORK CLOUD CLASSIFICATION RESEARCH

Ira G. Smotroff Mar. 1993 71 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A264628; MTR-93B0000039) Avail: CASI HC A04

Neural networks are appropriate for meteorological classification tasks for a number of reasons. First, their associative properties allow graceful degradation of performance under conditions of ambiguity and noise, thus avoiding the brittle behavior of many standard approaches. Second, they learn to perform tasks which cannot easily be specified analytically, such as non-linear discriminate functions. Finally, they can be executed in realtime on appropriate hardware. To exploit these properties, this research developed a general approach to meteorological classification based on neural network data fusion. The system was applied to cloud type identification from satellite imagery. The current experiment is one of the first to provide a large cloud database on which to train, and as such is one of the first true cross-validation experiments in this area. While the 27 days of data provides many pixel samples of the cloud types present at a particular hour, the question to be answered here was whether the samples collected on particular types of clouds sufficiently represent the variations of that cloud that can appear on a different day. The promising results point to the applicability of neural networks for automated generation of meteorological products in real time.

CLOUD IMPACTS ON DOD OPERATIONS AND SYSTEMS CONFERENCE (CIDOS-91)

D. D. Grantham and J. W. Snow 18 Dec. 1992 47 p Conference held in El Segundo, CA, 9-12 Jul. 1991
(AF Proj. 6670)
(AD-A264463; PL-TR-92-2336; ERP-1116) Avail: CASI HC A03/MF A01

The Tri-Service Cloud Modeling Program was established by OUSDR&E and is chaired by the Phillips Lab, Geophysics Directorate/GPA. As a part of this program, the CIDOS conference is held at 18-month intervals. This forum was attended by about 140 researchers and DoD systems designers/users to exchange information on requirements and ongoing research for cloud effects on weapon, communications and surveillance systems. The theme of CIDOS-91 was 'Clouds - The First Order Impact for Defense and Climate Change'. Two Keynote addresses were presented: 'Cloud Forecasting: The Challenge During Operation Desert Storm, by Lt. Col. Gerald Riley, Staff Weather Officer to DS Field HQ; and, a review of the International Satellite Cloud Climatology Project by Dr. W. B. Rossow, NASA, Director ISCCP. The latter keynote emphasized the need for greater exchange of cloud data between the civilian and military communities, especially in light of the Congressional Strategic Environmental Research & Development Program (SERDP). Three working groups deliberated on the topics: Better Customer Interface; New Model/Database Requirements; and the development of a new DoD Clouds Handbook. The recommendations from the working groups and the CIDOS Executive Committee will be submitted to OUSDR and E and will form new statements of need to the tri-service agencies.

ROCKET-TRIGGERED LIGHTNING STUDIES FOR THE PROTECTION OF CRITICAL ASSETS

M. E. Morris, R. J. Fisher, G. H. Schnetzer, K. O. Merewether, and R. E. Jorgenson 1993 15 p Presented at the Industrial and Commercial Power System Conference, Tampa, FL, 3-6 May 1993
(Contract DE-AC04-76DP-00789)
(DE93-009633; SAND-93-0530C; CONF-930514-1) Avail: CASI HC A03/MF A01

Lighting protection systems (LPS's) for explosives handling and storage facilities have long been designed similarly to those used for more conventional facilities, but their overall effectiveness in controlling interior electromagnetic (EM) environments has still not been rigorously assessed. Frequent lightning-caused failures of a security system installed in earth-covered explosives storage structures prompted the U.S. Army and Sandia National Laboratories to conduct a program to determine quantitatively the EM environments inside an explosives storage structure that is struck by lightning. These environments were measured directly during rocket-triggered lightning (RTL) tests in the summer of 1991 and were computed using linear finite-difference, time-domain (FDTD) EM solvers. The experimental and computational results were first compared in order to validate the code and were also used to construct bounds for interior environments corresponding to seven incident lightning flashes. The code insults were also used to develop simple circuit models for the EM field behavior--a process that resulted in a very simple and somewhat surprising physical interpretation of the structure's response that has significant practical and economic implications for design, construction, and maintenance of such facilities. DEADLIEST, COSTLIEST, AND MOST INTENSE US HURRICANES OF THIS CENTURY (AND OTHER FREQUENTLY REQUESTED HURRICANE FACTS)
P. J. Herbert, J. D. Jarrell, and M. Mayfield Feb. 1993 46 p Supersedes PB91-178004
(PB93-174993; NOAA-TM-NWS-NHC-31) Avail: CASI HC A03/MF A01

Lists of United States hurricanes which have caused 25 or more deaths and more than one hundred million dollars in damages have been compiled from all data sources available at the National Hurricane Center. The document is an update through the 1992 hurricane season. Hurricane Andrew, an intense hurricane causing about $25 billion damage to the coasts of Florida and Louisiana, requires nearly all of the damage and intensity tables to be revised. Because of Hurricane Iniki in the Hawaiian islands in 1992, Table 14 has been added covering Hawaiian hurricanes of this century, and certain tables have been modified to include Hawaiian and eastern Pacific hurricanes. The Hawaiian information, given in Table 14 was provided by the Honolulu Weather Service Forecast Office. NTIS

CASE STUDY OF THE OPERATIONAL USEFULNESS OF THE SHARP WORKSTATION IN FORECASTING A MESOCYCLONE-INDUCED COLD SECTOR TORNADO EVENT IN CALIFORNIA
J. P. Monteverdi Mar. 1993 32 p See also PB89-121297 Sponsored by National Weather Service, Salt Lake City, UT
(PB93-178697; NOAA-TM-NWS-WR-219) Avail: CASI HC A03/MF A01

An illustration of the operational usefulness of the SHARP Workstation in providing supplementary guidance to forecasters in a situation in which two tornadoes occurred in California's Sacramento Valley is presented. Use of the SHARP Workstation in analyzing the initial hodograph and in producing a bogus afternoon sounding and hodograph for the Sacramento Valley indicated that buoyancy and shear were in the correct range for moderate to strong mesocyclone-induced tornadoes. Conventional wisdom would have suggested that weak funnel clouds and small hail were the chief threats in the weather pattern. However, forecasters, aware of the role of shear in inducing storm rotation and of the potential for the weather pattern to be associated with favorable buoyancy and shear parameters in certain regions of California, would have been alert to the possibility of damaging and potentially life-threatening tornadoes. THE DISTRIBUTION OF THE ANNUAL AND SEMIANNUAL CYCLES IN THE TROPICS
W. L. Sumathipala Jun. 1992 24 p
(DE92-642213; IC-92/111) Avail: CASI HC A03/MF A01 (US Sales Only)

The distributions of annual and semiannual cycles in the tropics are studied using outgoing long-wave radiation (OLR), and FGGE level 3 b wind data. Amplitudes and variances of first and second harmonics (in the time domain) of low level zonal wind (U) are largest over monsoon regions of the eastern hemisphere and account for more than 80% of the variance. The first harmonic of OLR shows largest amplitudes over the continental regions between 10-15 degrees from the equator. The first harmonics of both low-level wind and OLR show standing character. The second and third harmonics of U are characterized by cross equatorial and clockwise phase propagation. All three harmonics are 'phase locked' in the monsoon region of the eastern hemisphere during summer. Amplitude of the first harmonic of low level meridional wind (V) is prominent at the Somalia coast and Malaysia. Amplitude variations of first and second harmonics of upper level zonal wind exhibit the response of subtropical jet streams to monsoon and inter-monsoon convective activity. Fairly strong amplitudes of OLR are found over the equatorial land areas where rainfall is maximum during the transition periods. DOE

MEASUREMENT OF THE ROTATION RAMAN SPECTRA OF NITROGEN, OXYGEN, AND WATER VAPOR UNDER CONDITIONS OF A TEMPERATURE HUMIDITY LIDAR Thesis - Hamburg Univ. [MESSUNG DER ROTATIONS-RAMAN-SPEKTREN VON STICKSTOFF, SAUERSTOFF UND WASSERDAMPF UNTER DEN BEDINGUNGEN EINES TEMPERATUR-FEUCHTE-LIDARS]
J. Zeyn 20 Mar. 1992 91 p In GERMAN
(GKSS-92/E/32; ETN-93-94188) Copyright Avail: CASI HC A05/MF A01

Spectroscopic investigations of nitrogen, oxygen, and water vapor are described. For the measurements of the pure rotational Raman spectra of these gases, a monochromator was designed. The source of radiation was a KrF excimer laser frequency shifted by stimulated Raman scattering in hydrogen. A thallium atom vapor filter was used for Mie and Rayleigh scattering suppression. An interference filter was implemented for weakening vibration rotation Raman lines. The design of the monochromator and the selection of the radiation source meet the requirements of a lidar system. It was possible to separate individual lines of the pure rotational Raman spectra and to verify the ratio of cross sections of nitrogen and oxygen. For the rotational Raman cross sections of water vapor an upper limit is given. ESA

SeaWIFS TECHNICAL REPORT SERIES. VOLUME 2: ANALYSIS OF ORBIT SELECTION FOR SeaWiFS: ASCENDING VERSUS DESCENDING NODE

Stanford B. Hooker, ed., Elaine R. Firestone, ed. (General Sciences Corp., Laurel, MD.), and Watson W. Gregg Washington Sep. 1992 20 p
(NASA-TM-104566-Vol-2; NAS 1.15:104566-Vol-2; Rept-92B00122) Avail: CASI HC A03/MF A01

Due to range safety considerations, the Sea-viewing Wide Field-of-view Sensor (SeaWiFS) ocean color instrument may be required to be launched into a near-noon descending node, as opposed to the ascending node used by the predecessor sensor, the Coastal Zone Color Scanner (CZCS). The relative importance of ascending versus descending near-noon orbits was assessed here to determine if descending node will meet the scientific requirements of SeaWiFS. Analyses focused on ground coverage, local times of coverage, solar and viewing geometries (zenith and azimuth angles), and sun glint. Differences were found in the areas covered by individual orbits, but were not important when taken over a 16 day repeat time. Local time of coverage was also different: for ascending node orbits the Northern Hemisphere was observed in the morning and the Southern Hemisphere in the afternoon, while for descending node orbits the Northern Hemisphere was observed in the afternoon and the Southern in the morning. There were substantial differences in solar azimuth and spacecraft azimuth angles both at equinox and at the Northern Hemisphere summer solstice. Negligible differences in solar and spacecraft zenith angles, relative azimuth angles, and sun glint were obtained at the equinox. However, large differences were found in solar zenith angles, relative azimuths, and sun glint for the solstice. These differences appeared to compensate across the scan, however, an increase in sun glint in descending node over that in ascending node on the western part of the scan was compensated by a decrease on the eastern part of the scan. Thus, no advantage or disadvantage could be conferred upon either ascending node or descending node for noon orbits. Analyses were also performed for ascending and descending node orbits that deviated from a noon equator crossing time. For ascending node, afternoon orbits produced the lowest mean solar zenith angles in the Northern Hemisphere, and morning orbits produced the lowest angles for the Southern Hemisphere. For descending node, morning orbits produced the lowest mean solar zenith angles for the Northern Hemisphere; afternoon orbits produced the lowest angles for the Southern Hemisphere. SeaWIFS TECHNICAL REPORT SERIES. VOLUME 6: SeaWiFS TECHNICAL REPORT SERIES CUMULATIVE INDEX: VOLUMES 1-5

Stanford B. Hooker, ed. and Elaine R. Firestone, ed. (General Sciences Corp., Laurel, MD.) Washington Nov. 1992 12 p
(NASA-TM-104566-Vol-6; NAS 1.15:104566-Vol-6; Rept-93B00016) Avail: CASI HC A03/MF A01

The Sea-viewing Wide Field-of-view Sensor (SeaWiFS) is the follow-on ocean color instrument to the Coastal Zone Color Scanner (CZCS), which ceased operations in 1986, after an eight year mission. SeaWiFS is expected to be launched in August 1993, on the Sea Star satellite, being built by Orbital Sciences Corporation (OSC). The SeaWiFS Project at the NASA/Goddard Space Flight Center (GSFC) has undertaken the responsibility of documenting all aspects of this mission, which is critical to the ocean color and marine science communities. This documentation, entitled the SeaWiFS Technical Report Series, is in the form of NASA Technical Memoranda Number 104566. All reports published are volumes within the series. This volume serves as a reference, or guidebook, to the previous five volumes and consists of four main sections including an index to key words and phrases, a list of all references cited, and lists of acronyms and symbols used. It is our intention to publish a summary index of this type after every five volumes in the series. This will cover the topics published in all previous editions of the indices, that is, each new index will include all of the information contained in the preceding indices. Author

STEADY-STATE AND TRANSIENT MODELING OF TRACER AND NUTRIENT DISTRIBUTIONS IN THE GLOBAL OCEAN

T. F. Stocker and W. S. Broecker Mar. 1993 10 p
(Contract DE-FG02-91ER-61202)
(DE93-011043; DOE/ER-61202/2) Avail: CASI HC A02/MF A01

The balance of stable and decaying tracers was incorporated into a latitude-depth ocean circulation model which resolves the major ocean basin and is coupled to an atmospheric energy balance model. The modern distribution of radiocarbon and the analysis of artificial color tracers enabled the census of the deep water masses. We show that good agreement with the observation can be achieved if the surface forcing is modified. The same process could also account for long-term, large-scale changes of the global thermohaline circulation. Uptake rates of carbon are investigated using an inorganic carbon cycle model and performing 2 x CO2 experiments. We prescribe the industrial evolution of pCO2 in the atmosphere from 1792 to 1988 and calculate the total flux of carbon into the world ocean. Results are in good agreement with two recent 3-dimensional model simulations. First results using an organic carbon cycle in this model are presented. Changes in the hydrological cycle can stabilize the thermohaline circulation in the Atlantic and enable simulation of climate events resembling the Younger Dryas. By adding the balance of radiocarbon the evolution of its atmospheric concentration is studied during rapid changes of deep ocean ventilation. A resumption of ventilation creates a rapid decrease of atmospheric radiocarbon which is able to mask the natural decay. DOE

ANALYSES OF DATA FROM FINE STRUCTURE AND CIRCULATION STUDIES IN THE GULF OF CALIFORNIA Final Report, 1 Mar. 1991 - 30 Sep. 1992

Myrl C. Hendershott Apr. 1993 3 p
(Contract N00014-91-J-1791)
(AD-A262910) Avail: CASI HC A01/MF A01

The objective of this proposal was to complete the analysis and manuscripts of the CTD data collected in the Gulf of California. The most important accomplishment of the present reporting period has been completion, submission for publication to Deep Sea Research, and acceptance, subject to minor modifications requested by a referee, of a paper by Ph.D. student Juan Rodrigues-Sero and M.C. Hendershott describing fine structure in the Gulf of California. The title is 'Vertical Temperature Gradient Fine Structure Spectra in the Gulf of California.' We have also made significant progress on a manuscript with A. de Leon and A. Badan Dangon, of CICESE (Ensenada, Mexico) in which ADCP data collected in the northern Gulf of California in Jan. 1990 are processed to extract the tidal velocity field there. The initial reduction of observations is complete, but we wish to include in the publication a comparison with tidal model results to be provided by researchers at CICESE and then to re-analyze the data using the model fields as a basis set rather than simple polynomials in the space coordinates. OPTICAL MEASUREMENTS OF RIPPLES USING A SCANNING LASER SLOPE GAUGE. PART 1: INSTRUMENTATION AND PRELIMINARY RESULTS

Robert J. Martinsen and Erik J. Bock Mar. 1993 15 p
(Contract N00014-90-J-1717)
(AD-A261939; WHOI-Contrib-8701) Avail: CASI HC A03/MF A01

We describe the design, implementation, and deployment of a laser slope gauge developed at the Woods Hole Oceanographic Institution for the purpose of studying the propagation characteristics of capillary ripples, and how currents and natural slicks on the ocean surface modify ripple spectra. The laser slope gauge constitutes a nondisruptive optical technique for determining the slope spectrum for a range of waves with wavelengths between 2 mm and 20 cm using both spatial and temporal information. Operation of the sensor and data acquisition system is discussed and a sample data record collected in the Gulf Stream off Cape Hatteras, NC is interpreted and analyzed. DTIC

During a 1991 oceanographic research expedition to the Juan de Fuca Ridge, the Deep Submergence Laboratory (DSL) of the Woods Hole Oceanographic Institution (WHOI) applied interactive mapping with a geographic information system (GIS) in conjunction with real-time navigation. As DSL's remotely operated vehicle (ROV), Jason, surveyed a hydrothermal vent field, acoustic navigation updates were combined with maps generated to the specifications of participating scientists. The maps, which were generated in near-real time, were used to plan vehicle operations in a hazardous environment and to monitor survey progress and data quality. Geologic observations made in real-time by scientists monitoring ROV sensors were logged into data files, combined with processed navigation, and used to produce preliminary updates to maps of the vent field. This experimental combination of GIS technology with navigation and visualization software was highly successful. Future scientific efforts will include further processing of sensor data, integration of image products into the GIS database, and the production of high-quality mapping products. DTIC

OCEAN WAVES IN SAMSON/SWADE Final Technical Report
1993 4 p
(Contract N00014-90-J-1255)
(AD-A263681) Avail: CASI HC A01/MF A01

The scientific objective of this project was to determine the origin and governing dynamics of the low frequency (nominally 0.01 Hz) infragravity waves which are sometimes very energetic in shallow water. Possible generation mechanisms include local nonlinear forcing of bound infragravity waves by groups of sea and swell, excitation of freely propagating edge waves in nearby surf zones, and ocean-basin-wide propagation of infragravity waves excited by large, distant storms. Important dynamical questions include what are the amounts of infragravity energy reflected by the beach face, refractively trapped during propagation across the shelf, and lost by bottom friction. A FIELD INVESTIGATION OF WATER AND SALT MOVEMENT IN PERMAFROST AND THE ACTIVE LAYER Final Report, 1 Jul. 1989 - 31 Dec. 1992
T. E. Osterkamp Feb. 1993 46 p
(Contract DAAL03-89-K-0106)
(AD-A263706; ARO-26281.5-GS) Avail: CASI HC A03/MF A01

Evidence from subsea permafrost, permafrost in coastal regions of the Arctic and Antarctic, and in the cold and sometimes arid regions of China, the Soviet Union, Antarctica, and North America, indicates that saline permafrost is very widespread - perhaps more common than non-saline permafrost. This salty permafrost is found near the surface at depths of geotechnical interest, within, and under continuous and discontinuous permafrost. These salts can produce significant changes in permafrost properties and processes and it is possible for these salts to become mobile under potential energy gradients. It is concluded that saline permafrost will become increasingly important in the rational assessment of scientific, engineering, environmental, and agricultural problems of the future. DTIC

UPPER OCEAN MODEL OF DISSOLVED ATMOSPHERIC GASES
R. Schudlich and S. Emerson 1992 13 p
(Contract DE-FG06-90ER-61037)
(DE93-010151; DOE/ER-61037/1) Avail: CASI HC A03/MF A01

The goal of this project is to estimate the rate of biological oxygen production at Hawaiian Ocean Time-series station ALOHA in the central North Pacific ocean. Our approach is to use an upper ocean model together with measurements to interpret an annual cycle of temperature, salinity, dissolved oxygen, argon, nitrogen, and the stable isotope ratio of oxygen at station ALOHA. This project represents the first upper ocean geochemical study in which model predictions are verifiable by independent measurements. Using the model, we will be able to assess the relative roles played by physical processes (air-sea gas exchange, air injection by bubbles, temperature-induced changes in gas solubility, trapping below the mixed layer, and diffusion) and biological processes (photosynthesis, respiration, and nutrient recycling) in producing the observed distribution of dissolved atmospheric gases. The long term goal of this project is to understand the utility of chemical tracers for quantifying biological processes in the ocean. DOE

OPTICAL SLOPE/HEIGHT MEASUREMENTS OF SMALL SCALE WAVES WITHIN THE SAXON-FPN EXPERIMENT Final Report, 30 Sep. 1989 - 29 Sep. 1992
B. Jahne, S. Waas, and J. Klinke 16 Feb. 1993 10 p
(Contract N00014-89-J-3222)
(AD-A262572) Avail: CASI HC A02/MF A01

This research focused on measurements of short wind waves in the open ocean with optical techniques using a triple strategy. First, optical imaging of short wind waves was reviewed using an unified approach based on the shape from shading and shape from stereo paradigms from computer vision. This analysis revealed the weaknesses of conventional stereo and Stilwell photography. Refraction-based techniques perform much better, but reflection-based can also be used to obtain statistical wave slope data. Second, laboratory measurements of short wind waves in three different wind wave facilities revealed some surprising new features of the wave number spectra that seem also to be valid for oceanic conditions but in contrast to existing theory. Third, a new optical system, the Reflective Stereo Slope Gauge (RSSG), was developed that measures the slope and height of large waves and statistical parameters of short waves. The feasibility of the new concept was demonstrated with measurements at Scripps Pier and the Noordwijk Research Platform. A second-generation instrument will be built for routine measurements in a follow-up project. DTIC

USING C-VECTOR METHOD TO DERIVE THE THREE-DIMENSIONAL CIRCULATION PATTERN NEAR THE EAST GREENLAND POLAR FRONT M.S. Thesis
Wei-Szu Li Dec. 1992 111 p
(AD-A261979) Avail: CASI HC A06/MF A02

The C-vector method is used to determine the three-dimensional pseudo-vorticity field of the East Greenland Current by using a CTD data set acquired during the 1984 Northwind cruise. The value of the ageostrophic pseudo-vorticity, the total (geostrophic and ageostrophic) pseudo vorticity, and the vertical component of the C-vector curl, Psi, can be calculated by the C-vector method. From these values the pseudo-vorticity can be investigated for the East Greenland Current. Additionally, the positive and the negative vertical motion at each level can be investigated from the Psi value. A two-cell structure with downward motion around the East Greenland Polar Front was found. The C-vector method also demonstrates that the vertical circulation induced by an anticyclonic gyre and the cross-coastal circulation generated by the surface wind can be depicted. DTIC

OCEAN AEROSOL MEASUREMENTS AND MODELS IN THE STRAITS OF FLORIDA (THE KEY-90 EXPERIMENT)
Stuart G. Gathman 1992 15 p Previously announced in IAA as A93-37103
(AD-A264777) Avail: CASI HC A03/MF A01

The Navy Oceanic Vertical Aerosol Model (NOVAM) has been under development for some time. The model showed considerable promise in its first verification test during the First International Satellite Cloud Climatology Project (ISCCP) Regional Experiment (FIRE) in the eastern Pacific. Because much of the development work on NOVAM was done in this oceanic region, the model needed to be tested in very different environments to see just how universally it could be applied to other regions. KEY-90 was an experiment carried out in the tropical waters between the Florida Keys and Cuba in July 1990 to test the model. It included investigators from the U.S., U.K., and the Netherlands. The experiment included two lidars, two aircraft, a small boat, buoys, and several shore installations. The experiment provided an excellent data base not only to test the model for the tropical water scenario, but also to further investigate the convective marine boundary layer and to enhance further modeling schemes in this region. This paper describes the optical, IR, and meteorological measurements made during KEY-90 and shows the comparison between the NOVAM model predictions and measurement. DTIC

A WATER MASS ANALYSIS OF THE 1991-1992 EL NINO SIGNAL IN THE FARALLON ISLANDS REGION M.S. Thesis

Kevin A. Hays Mar. 1993 96 p

(AD-A263490) Avail: CASI HC A05/MF A01

Five hydrographic (CTD) and acoustic Doppler current profiler (ADCP) cruises were conducted in Feb., May, Aug., and late Oct./early Nov. 1991 and Feb. 1992 near the Farallon Islands off of central California in order to determine the seasonal variation of the circulation in the region. The timing of the study was such that the onset of the 1991-1992 El Nino/Southern Oscillation was directly observed in the data obtained. A detailed hydrographic analysis of the data showed single station temperature anomalies as great as 4.48 standard deviations warmer than the historical 40 year CalCOFI mean, and salinity anomalies 5.58 standard deviations fresher during Feb. 1992. The maximum anomalies for both temperature and salinity were between 100-150 m depth and within one Rossby radius (20 km) of the continental shelf break. A T-S analysis suggested that there were no large intrusions of different water mass types, and that, the anomalies resulted primarily from altered mixing processes due to thermocline/halocline depression. Strong positive sea level anomalies for the west coast of North and South America occurred simultaneously at the Equator and the far north (Gulf of Alaska) then spread from both directions towards central California. The broadening and strengthening of the Aleutian low caused onshore transport and downwelling at the Farallones site. Oceanic processes propagating northward may have occurred but could not be rigorously identified with this data set. DTIC

DYNAMICS OF SMALL-SCALE OCEANIC MOTIONS

Peter Muller 1992 4 p

(Contract N00014-90-J-1419)

(AD-A263582) Avail: CASI HC A01/MF A01

Goals of this research include a description and modeling of the kinematical structure and dynamical processes of oceanic motions that have horizontal scales from a few meters to a few kilometers; understanding the role that these small-scale motions play in the redistribution and mixing of the momentum, potential vorticity, heat, and salt; and to contribute to the construction of a global numerical model that will predict this redistribution and mixing. Objectives are to identify the processes that affect the kinematical and dynamical evolution of near-inertial internal gravity waves, especially those processes that can transfer energy out of near-inertial internal waves into the internal wave continuum and to simulate these processes in a numerical model. DTIC

N93-29977# Naval Postgraduate School, Monterey, CA.

ANALYSIS OF A SIMULATION OF THE SEASONAL CYCLE IN THE TROPICAL PACIFIC OCEAN IN AN EDDY-RESOLVING GLOBAL OCEAN MODEL M.S. Thesis

Lawrence J. Gordon Sep. 1992 81 p

(AD-A264007) Avail: CASI HC A05/MF A01

The multi-level, primitive equation, global ocean circulation model of Semtner and Chervin is examined for its ability to simulate the seasonal cycle in the tropical Pacific Ocean. The result of a 20-year integration of this model using annual mean wind forcing was reported in Semtner and Chervin. This was the first global eddy-resolving ocean calculation and it showed many realistic features of ocean circulation. The phase of the simulation analyzed incorporates seasonally varying wind forcing from the Hellerman and Rosenstein global data set. These wind stress values were defined on a grid with 2 deg spacing which were interpolated to the one-half degree grid points of the Semtner and Chervin model. There is no interannual variability in the wind fields of this data set. The results presented are from the fourth year of a 10-year seasonal cycle run. The upper oceanic circulation of the equatorial Pacific Ocean consists of alternating westward and eastward flows that vary seasonally in strength and extent. The eastward flows investigated are the Equatorial Undercurrent and North Equatorial Countercurrent; the westward currents are the North and South Equatorial Currents. The Equatorial Undercurrent is most intense late in the Northern Hemisphere spring and is weak in the late fall at which time the North Equatorial Countercurrent and the South Equatorial Current are most intense. This result is in agreement with observations and other model studies. DTIC

MODELLING THE DYNAMICS OF A LARGE SEA AREA

J. Koponen (Oulu Univ., Finland.), E. Alasaarela (Oulu Univ., Finland.), K. Lehtinen (Water and Environment District of Central Finland.), J. Sarkkula, P. Simbierowicz (Technical Research Centre of Finland, Helsinki.), Heimo Vepsa (Water and Environment District of Oulu, Finland.), and M. Viranen (Technical Research Centre of Finland, Helsinki.) 1992 91 p

(DE93-778330; VYH-Pub-7; ISBN-951-47-4284-2) Avail: CASI HC A05/MF A01

The dynamics of the Bothnian Bay was studied mainly by means of numerical models. The model results were supported by flow velocity measurements and by water quality components sampled for more than twenty years in the research area. Prior to the study an extensive review was made on the model usage abroad. The main tools of the project, 3-dimensional (3D) current and water quality models were developed in many aspects. An efficient 2D multigrid model for flow fields and an automatic grid generation program were developed for applications where good horizontal resolution is needed over large sea areas. The success in computing the surface currents was tested in several cases (oil accident, drifting of objects). As a local application of the models, the effects of different loading alternatives on the water quality off the town of Kemi was calculated. Based on model results and measurements a proposal was made to develop the water quality monitoring program. DOE

SHEAR, STRAIN, AND THERMOHALINE VERTICAL FINE STRUCTURE IN THE UPPER OCEAN Ph.D. Thesis

Steven Paul Anderson 1992 187 p

Avail: Univ. Microfilms Order No. DA9307900

Observations of fine scale (1-100m) vertical shear, strain, and thermohaline structure are interpreted in terms of internal wave and frontal zone dynamics. The data were collected with the Marine Physical Laboratory 161 kHz Doppler sonar and a pair of CTD's. The two systems were operated from R/P FLIP for 18 days during February-March, 1990, as part of the SWAPP (35 deg N, 127 deg W) experiment. These simultaneous measurements of velocity and density provide an unique opportunity to study the vertical advection of shear layers. The observed shear variance is dominated by near inertial waves, with 35 m vertical wavelengths. These inertial waves propagate down from the mixed layer and are vertically advected by higher frequency waves. Vertical wavenumber-frequency spectra of shear and strain are examined in Eulerian (fixed depth) and semi-Lagrangian (isopycnal following) coordinates. The semi-Lagrangian shear and strain variances are more consistent with variances modeled by a linear superposition of internal waves. The p.d.f.'s of buoyancy frequency and Froude number (buoyancy normalized shear) are determined using the kinematic strain model of Pinkel and Anderson. The Froude number distribution shows good agreement with data presented and historical data. The advection of a frontal zone past the experiment site yielded detailed observations of frontal interleaving. Two vertical interleaving scales are observed. Five to fifteen meter scales appear to be double diffusively driven and are consistent with the laboratory model of Ruddick and Turner, 40 m to 60 m scales are likely determined by internal wave or sub-mesoscale frontal dynamics. The observed front appears to be in near geostrophic balance. Dissert. Abstr.

FIBER OPTIC CHEMICAL SENSORS FOR CHARACTERIZING THE CARBON CYCLE IN OCEAN MARGIN REGIONS
M. D. DeGrandpre and F. L. Sayles 13 Apr. 1993 7 p
(Contract DE-FG02-92ER-61437)
(DE93-011442; DOE/ER-61437/1) Avail: CASI HC A02/MF A01

The overall objective of our DOE-Ocean Margins Programs grant is to develop a pCO2 sensor for long-term monitoring of pCO2 in the ocean margins and to establish a proving ground for the development of other chemical sensors for characterizing the carbon cycle in these regions. We have succeeded in keeping with the approximate timeline outlined in the original proposal, which, for year 1 included the following objectives: Continue sensor optimization, test response characteristics (reagent and sample flow rates, temperature), introduce position sensitive photodiode and photodiode array spectrophotometers and evaluate, develop reliable and reproducible fabrication techniques, develop sensor based on preliminary studies optimized for field measurements (minimize size and power requirements), test long-term stability of the sensor in the laboratory, determine susceptibility to fouling and corrosion. This work is summarized below along with a brief review of the sensor's operating principle. DOE

MEASUREMENTS OF OCEAN CURRENTS ACROSS THE CONTINENTAL MARGIN OFF POINT SUR, CALIFORNIA, DURING MARCH 1989 M.S. Thesis
Anthony J. Negron Mar. 1993 87 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A264853) Avail: CASI HC A05

Mean currents and density were measured off Point Sur, California in March 1989 using Pegasus and CTD instruments. Velocity, temperature, salinity, and density fields are examined to discern the structure of the California and Davidson currents. Velocities measured by Pegasus are compared to flow fields derived from geostrophy. The Davidson Current flows poleward at the surface in its winter configuration despite northerly winds and coastal upwelling which normally drive the flow subsurface in the summer months. DTIC

PRINCIPAL COMPONENTS OF NATURAL IMAGES: AN ANALYTICAL SOLUTION
Yong Liu and Harel Shouval 17 May 1993 9 p
(Contract N00014-91-J-1316)
(AD-A264800) Avail: CASI HC A02/MF A01

The structure of receptive fields in the visual cortex is believed to be shaped by unsupervised learning. A simple variant of unsupervised learning is the extraction of principal components. In this paper, we derived analytically the form of the principal components of natural images. This derivation relies on results about the covariance matrix of natural images. Our results predict both the shapes and the phases of the receptive fields. We also compared our results to numerical simulation results. Finally, the biological relevance of our results is discussed. DTIC

To understand the relationship among under ice morphology, ice thickness, and the structure of the oceanic boundary layer, an Autonomous Oceanographic Sampling Network is being developed. Each network consists of a base buoy and a number of Autonomous Oceanographic Vehicles (AOV's) at fixed levels. The base buoy serves as a navigation beacon, energy source, telemetry link and surface sensor platform. Each AVO functions as a subsurface sensor platform, short term data logger and programmable, navigable vessel. Development of system components capitalizes on advanced microprocessors, navigation, and communication systems developed by DoD and industry for buoy and vessel technology. The first step will be to produce an AVO that has acceptable performance as a subsurface platform and which can dock with the base buoy and conduct data exchange. DTIC

IOC-UNEP REVIEW MEETING ON OCEANOGRAPHIC PROCESSES OF TRANSPORT AND DISTRIBUTION OF POLLUTANTS IN THE SEA
1991 29 p Meeting of the Review IOC-United Nations Environment Programme held in Zagreb, Yugoslavia, 15 May 1991
(DE93-605070; INIS-mf-13371; CONF-9105381) Avail: CASI HC A03/MF A01 (US Sales Only)

The IOC-UNEP Review Meeting on Oceanographic Processes of Transfer and Distribution of Pollutants in the Sea was opened at the Ruder Boskovic Institute, Zagreb, Yugoslavia on Monday, 15 May 1989. Papers presented at the meeting dealt with physical and geochemical processes in sea-water and sediment in transport mixing and dispersal of pollutants. The importance of mesoscale eddies and gyres in the open sea, wind-driven currents and upwelling events in the coastal zone, and thermohaline processes in semi-enclosed bays and estuaries was recognized. There is strong evidence that non-local forcing can drive circulation in the coastal area. Concentrations, horizontal and vertical distributions, and transport of pollutants were investigated and presented for a number of coastal areas. Riverine and atmospheric inputs of different pollutants to the western Mediterranean were discussed. Reports on two on-going nationally/internationally coordinated projects (MEDMODEL, EROS 2000) were presented. Discussions during the meeting enabled an exchange of ideas between specialists in different disciplines to be made. It is expected that this will promote the future interdisciplinary approach in this field. The meeting recognized the importance of physical oceanographic studies in investigating the transfer and distribution of pollutants in the sea and in view of the importance of the interdisciplinary approach and bilateral and/or multilateral co-operation a number of recommendations were adopted. Our overall aim is to obtain sufficient information to allow us to ultimately determine whether ELF EM field exposure is an initiating factor in neoplastic transformation and/or if exposure can mimic characteristics of the second-step counterpart in neoplastic disease. This aim is based on our previous findings that levels of some transcripts are increased in cells exposed to EM fields. While the research is basic in nature, the ramifications have bearing on the general safety of exposure to EM fields in industrial and everyday life. A large array of diverse biological effects are reported to occur as the result of exposure to elf EM fields, suggesting that the cell response to EM fields is at a basic level, presumably initiated by molecular and/or biophysical events at the cell membrane. The hypothesized route is a signal transduction pathway involving membrane calcium fluxes. Information flow resulting from signal transduction can mediate the induction of regulatory factors in the cell, and directly affect how transcription is regulated. DOE

AMINO ACID SEQUENCES FOR THE BINDING REGIONS IN SERUM ALBUMIN PROTEINS Patent Application
Daniel C. Carter, inventor (to NASA) 1 Mar. 1993 17 p
(NASA-Case-MFS-28402-1; NAS 1.71:MFS-28402-1; US-Patent-Appl-SN-024547) Avail: CASI HC A03/MF A01

In accordance with the present invention, biologically active protein fragments can be constructed which contain only those specific portions of the serum albumin family of proteins such as regions known as subdomains IIA and IIIA which are primarily responsible for the binding properties of the serum albumins. The artificial serums that can be prepared from these biologically active protein fragments are advantageous in that they can be produced much more easily than serums containing the whole albumin, yet still retain all or most of the original binding potential of the full albumin proteins. In addition, since the protein fragment serums of the present invention can be made from non-natural sources using conventional recombinant DNA techniques, they are far safer than serums containing natural albumin because they do not carry the potentially harmful viruses and other contaminants that will be found in the natural substances.

PROCESS FOR SELECTIVELY RECOVERING ALGAE AND PROTOZOA Patent Application
David A. Noever, inventor (to NASA) (Universities Space Research Association, Huntsville, AL.) 12 Apr. 1993 8 p
(NASA-Case-MFS-26124-1-NPO; NAS 1.71:MFS-26124-1-NPO; US-Patent-Appl-SN-045142) Avail: CASI HC A02/MF A01

A process is presented for selectively recovering swimming microorganisms from a liquid wherein the liquid is placed in a container and the container is rotated such that the coriolis force and the swimming activity of the microorganisms cause the microorganisms to concentrate in rings at different radii from the axis of rotation of the liquid. Liquid is withdrawn from the container at different distances from the axis of rotation of the container to selectively recover the microorganisms. NASA

REGULATION OF ALTERNATIVE CO2 FIXATION PATHWAYS IN PROCARYOTIC AND EUCARYOTIC PHOTOSYNTHETIC ORGANISMS
1992 3 p
(Contract DE-FG02-91ER-20033)
(DE93-012109; DOE/ER-20033/1) Avail: CASI HC A01/MF A01

The major goal of this project is to determine how microorganisms regulate the assimilation of CO2 via pathways alternative to the usual Calvin reductive pentose phosphate scheme. In particular, we are interested in the molecular basis for switches in CO2 metabolic paths. Several earlier studies had indicated that purple nonsulfur photosynthetic bacteria assimilate significant amounts of CO2 via alternative non-Calvin routes. We have deleted the gene that encodes. RubisCo (ribulose bisphosphate carboxylase/oxygenase) in both the Rhodobacter sphaeroids and Rhodospirillum rubrum. The R. sphaeroides RubisCO deletion strain (strain 16) could not grow under photoheterotrophic conditions with malate as electron donor and CO2 as the electron acceptor; however the R. rub RubisCO deletion strain (strain I-19) could. Over the past year we have sought to physiologically characterize strain 16PHC. We found that, 16PHC exhibited rates of whole-cell CO2 fixation which were significantly higher than strain 16. Strain 16PHC could not grow photolithoautotrophically in a CO2 atmosphere; however, CO2 fixation catalyzed by photoheterotrophically grown 16PHC was repressed by the addition of DMSO. Likewise, we found that cells initially grown in the presence of DMSO could induce the CO2 fixation system when DMSO was removed. Thus, these results suggested that both PHC and I-19 could be used to study alternative CO2 fixation reactions and their significance in R. sphaexoides and R. rubrum. DOE

GROWING WHEAT TO MATURITY IN REDUCED GAS PRESSURES Final Report, 1 Apr. 1992 - 30 Jun. 1993
Edward J. Rykiel, Jr., Malcolm C. Drew, and Brad D. Etter 30 Jun. 1993 70 p
(Grant NAG9-582)
(NASA-CR-193245; NAS 1.26:193245) Avail: CASI HC A04/MF A01

The main objective of this project was to determine assimilation of CO2 and efficiency of water use in wheat grown to maturity in a low pressure total gas pressure environment. A functional test of the low pressure plant growth chamber system was accomplished in February and March of 1993 wherein this objective was partially achieved. Plants were grown to maturity in the chambers. Data were actively collected during the first 29 days. The plants were allowed to maintain themselves at the CO2 compensation point until day 45 of the study at which point active atmospheric regulation was resumed. This provided data at the vegetative and reproductive stages of the life cycle of the plants. However, this information may not be representative of the performance of the plants due to the loss of low pressure on a number of days during the study, which affected the plants by changing the pressure potential of the tissues. The performance of the system will be discussed on a component by component basis. The maintenance of the plants at the CO2 compensation point was driven by the failure of the computer program operating the system. The software problems that arose during the functional test have since been corrected. Results from the functional test also indicated that the plants were not receiving adequate light and nutrients. The growth chambers have been relocated and the growth room modified to compensate for these deficiencies. Derived from text

Ultraviolet action spectra of inactivation were compared between wet and dry state spores of the Streptomyces griseus. In vacuum, the spores are more resistant to UV by a factor of 2 than under wet conditions. Their photoreactivability is reduced. The cross sections for induction of DNA (Deoxyribonucleic Acid) double strand breaks and for inactivation show similar dependence on wavelengths. ESA

CENTER OF EXCELLENCE IN BIOTECHNOLOGY (RESEARCH) Final Report, 22 Dec. 1986 - 21 Dec. 1992
L. Jelinski and Milton Zaitlin Mar. 1993 32 p
(Contract DAAL03-87-K-0004)
(AD-A263598; ARO-24629.68-LS-UIR) Avail: CASI HC A03/MF A01

The ARO Center of Excellence in Biotechnology was established within the Cornell University Biotechnology Program in 1986. The research focus of the Center was protein structure and function, with special emphasis on enzymes and receptors. Research projects funded through the Center represented a multidisciplinary attack on the molecular basis of how proteins and enzymes work, how energy and enzymic processes are coupled through cell membranes, how membrane receptors are used to transmit signals to the cell, and how signals are transmitted in the nervous system. The final report summarizes the results of the research. DTIC

A ROBUST MODEL FOR FINDING OPTIMAL EVOLUTIONARY TREES
M. Farach (Rutgers - The State Univ., Piscataway, NJ.), S. Kannan (Arizona Univ., Tucson.), and T. Warnow 1993 13 p Presented at the Association for Computing Machinery Symposium on the Theory of Computing, San Diego, CA, May 1993
(Contract DE-AC04-76DP-00789)
(DE93-010682; SAND-93-0361C; CONF-9305153-2) Avail: CASI HC A03/MF A01

Constructing evolutionary trees for species sets is a fundamental problem in biology. One of the standard models assumes the ability to compute distances between every pair of species and seeks to find an edge-weighted tree T in which the distance d(sub ij)(exp T) in the tree between the leaves of T corresponding to the species i and j exactly equals the observed distance, d(exp ij). When such a tree exists, this is expressed in the biological literature by saying that the distance function or matrix is additive, and trees can be constructed from additive distance matrices in O(n(exp 2)) time. Real distance data is hardly ever additive, and we therefore need methods (such as approximation algorithms with guaranteed error bounds) for handling such data. In this paper, we present several natural and realistic ways of modeling the inaccuracies in the distance data. In one model, we assume that we have upper and lower bounds for the distances between pairs of species and try to find an additive distance matrix between these bounds. In a second model, we are given a partial matrix and asked to find if we can fill in the unspecified entries in order to make the entire matrix additive. For both of these models, we also consider a more restrictive problem of finding a matrix that fits a tree which is not only additive but also ultrametric. Ultrametric matrices correspond to trees which can be rooted so that the distance from the root to any leaf is the same. Ultrametric matrices are desirable in biology since the trees then indicate evolutionary time. We give polynomial time algorithms for some of the problems while showing others to be NP-Complete. We also consider various ways of 'fitting' a given distance matrix to a tree in order to minimize various criteria of error in the fit. For most criteria this optimization problem turns out to be NP-Hard, while we do get polynomial time algorithms for some. DOE

MULTIPLE NEURON RECORDING IN THE HIPPOCAMPUS OF FREELY MOVING ANIMALS Annual Report, 1 Dec. 1991 - 30 Nov. 1992

Sam A. Deadwyler 30 Mar. 1993 6 p
(Grant AF-AFOSR-0092-90)
(AD-A264807; BGSM-PP-92-001; AFOSR-93-0285TR) Avail: CASI HC A02/MF A01

Progress has been significant over the previous year on the development of multineuronal recording and systems for analysis of the multineuronal data. This was a primary objective of the three laboratory consortium, and it has been a principle focus of the research efforts. The multitasking computer system has been in operation in all three laboratories this past year, as well as the DSP-based multineuron spike-sorter and the associated software interface for neural spike discrimination. Much of the research effort in the past year has been directed toward implementing the spike-sorter system, collecting multineuron data, and developing the analysis strategies. In addition, studies using the multineuron data acquisition have revealed new relationships between the behavioral events in the DMTS and patterns of simultaneously active neurons in the hippocampus. The following report will summarize these and other accomplishments in the third year of the award. DTIC

Dimethylsulfide (DMS) plays a central role in the transfer of sulfur from the ocean to the atmosphere and ultimately to land. The most abundant volatile organosulfur compound in seawater, DMS is believed to account for the bulk of the sea-to-air biogenic sulfur flux. DMS has also been implicated as the major precursor of submicron-sized sulfate aerosol over the ocean. This aerosol acts as an effective site for cloud droplet condensation suggesting a possibly important role for DMS in marine cloud formation. In the ocean, the precursor of DMS is presumed to be the zwitterionic sulfonium compound dimethylsulfoniopropionate (DMSP), a common osmoticum in certain classes of marine algae. While some algae can cleave DMSP intracellularly to form DMS, correlation of DMS concentrations with indicators of algal productivity on a local scale is poor. This thesis focuses on an alternative pathway of DMS formation: microbial cleavage of dissolved (extracellular) DMSP. In laboratory studies, bacteria able to cleave DMSP to form DMS were isolated from seawater by a DMSP enrichment technique, and the kinetics of DMSP uptake and DMS production were examined closely in pure cultures of a bacterial isolate from the Sargasso Sea. The isolate could grow with both DMSP and acrylic acid, one of the products of DMSP cleavage, as the sole source of carbon and energy, and the enzyme catalyzing DMSP cleavage appeared to be induced by both of these compounds. Kinetic parameters were estimated for DMSP uptake and cleavage by whole cells. Comparison of the 16S rRNA sequence of this isolate with that of known eubacteria showed that it was most closely related to Erythrobacter longus, an aerobic, bacteriochlorophyll-containing member of the alpha proteobacteria. AN ASSESSMENT OF PERIPHERAL NERVE DAMAGE IN THE RAT FOLLOWING NON-FREEZING COLD EXPOSURE: AN ELECTROPHYSIOLOGICAL AND HISTOPATHOLOGICAL EXAMINATION Technical Report, Jan. 1991 - Jan. 1992

David Shurtleff, Roger W. Gilliatt, John R. Thomas, and G. H. Pezeshkpour 20 Jan. 1993 19 p
(AD-A264293; NMRI-93-1) Avail: CASI HC A03/MF A01

The effect of exposure to non-freezing cold temperature on peripheral nerve was studied in vivo. Rats' tails and a portion of their lower backs were submerged in 1 C water for either 10 or 12 hours. Changes in evoked ascending nerve action potentials, and muscle action potentials in the rat tail and lumbar spine, were studied periodically over a three week period following cold exposure. In addition, ventral caudal nerves were excised 27 days following cold exposure and histopathology was performed. Electrophysiological analysis indicated initial nerve damage appeared to be just below the surface of the water, and later, in the first week after exposure, Wallerian degeneration occurred. Histopathological analysis revealed damage to the large myelinated fibers and capillaries within the fascicle following cold exposure. These results further validate the use of the rat tail as a model for non-freezing cold injury (NFCI) and suggest that the injury's etiology is multifaceted, which may require a variety of strategies and interventions to prevent its occurrence. DOKMA: A DOCUMENT ORIENTED COMMUNICATION MODEL FOR MEDICAL APPLICATIONS AS A BASIS OF A ROLE SYSTEM IN THE MEDICAL FIELD Ph.D. Thesis [DOKMA: EIN DOKUMENTENORIENTIERTES KOMMUNIKATIONSMODELL FUER MEDIZINISCHE ANWENDUNGEN ALS BASIS FUER EIN ROLLENSYSTEM IM MEDIZINISCHEN UMFELD]

Christian Gayda 1992 248 p In GERMAN
(ETN-93-93799) Avail: CASI HC A11/MF A03

Starting with an abstract communication model that examines communication aspects in general, the document oriented communication model for medical applications is developed. It relies on a transfer model. The requirements towards this transfer model are defined by means of the document oriented communication model for medical applications. The communication model itself has to fulfill three requirements. A specification phase has to be supported by this model. Furthermore, it should constitute a kind of reference model for discussion purposes and it must support a verification phase. In order to reach these goals within the communication model for medical applications, the related problems concerning document oriented communication are assigned to layers that are put in relation to each other. The integration and communication of patient data by means of computers imply special requirements on data security. Therefore, the document oriented communication model for medical applications takes these aspects into consideration within a security of roles. A second goal of this model is to support the flow of documents. The description of the role model and its implementation (the role system) constitutes the second focal point of this thesis. ESA

EVALUATION AND OPTIMIZATION OF A FLEXIBLE FILTRATION SYSTEM FOR RESPIRATORY PROTECTION SYSTEM 21 Final Report
K. C. Hofacre, R. L. Markham, and V. M. Northrup Feb. 1993 43 p
(Contract DLA900-86-C-2045)
(AD-A262467; CBIAC-SS-373) Avail: CASI HC A03/MF A01

Current filter elements for the M40 series of respirators are housed in rigid, metal canisters that contain media for aerosol filtration, and adsorption of gases or vapors. The filtration media is often pleated for increased surface area. Certain harmful gases are removed by adsorption to activated carbon that has been treated with hexavalent chromium or zinc metal cations in a process known as whetlerization. Whetlerization provides active sites to chemisorb certain poison gases. The carbon is generally present as a coarse granular bed, but can also be present in a powder form incorporated in a fabric, as in the M13A2 filter element. DTIC

PROCEEDINGS OF A WORKSHOP ON MOLECULAR NUCLEAR MEDICINE
R. C. Reba, ed. 1992 161 p Workshop held in Washington, DC, 22-23 Jan. 1992
(DE93-010828; CONF-920113-7) Avail: CASI HC A08/MF A02

The Office of Health and Environmental Research (OHER) of the Department of Energy (DOE) has increased the emphasis on research in structural biology and molecular biology. The department has increased support substantially in the area of basic molecular and structural biology research. To exploit the advances in these fields, OHER has sought to apply those advances in their other areas of responsibility, e.g., health effects research, environmental biology, and, in particular, nuclear medicine. The applications of biotechnology have contributed greatly to the productive research efforts of molecular biology. These techniques include gene manipulation for targeted gene delivery; characterization of molecular probes for hormone, tumor, and neuroreceptors; the receptor-agonist/antagonist binding interactions; studies of mechanisms of cellular communication; and the development of in vitro diagnostics such as molecular probes for studying the aging process and patients with mental disorders, cancer, and atherosclerosis. The importance of this work is the reasonable expectation that mainly, through an appreciation of the molecular basis of disease, will the most effective and rapid progress be made toward understanding, identifying, solving, and preventing specific disease processes. Critical questions arising before and during the workshop are how the following technologies can be applied in a practical clinical research or patient management setting: the recombinant DNA methodology, the technology of engineered monoclonal antibodies, the new methods for protein production and purification, and the production of transgenic animals. DOE

INFLUENCE OF THE COLD BUSTER (TM) SPORTS BAR ON HEAT DEBT, MOBILIZATION AND OXIDATION OF ENERGY SUBSTRATES
A. L. Vallerand, I. F. Schmegner, and I. Jacobs Dec. 1992 30 p
(AD-A262762; DCIEM-92-60) Avail: CASI HC A03/MF A01

In a recent study, we have shown that the commercially available Cold Buster(TM) Sports bar, purported to improve cold resistance, did not do so in our subjects exposed to a relatively severe cold test. One possible explanation for our conflicting results is that our metabolic rate (M) was too high for the possibly small thermogenic effect of the bar to be measurable. The goal of this study was therefore to re-evaluate, under milder conditions, the influence of the Cold Buster(TM) on heat balance (heat debt = heat production - heat losses) and body temperatures. Eight semi-nude fasted subjects were exposed to the cold (3h at rest, 10 C, less than 0.4 m/s wind) on two occasions following the ingestion of either a placebo (100 ml water) or a Cold Buster(TM) (all feedings at min 0 and 90). As a result of the cold, M, dry heat losses and heat debt (S) increased whereas mean skin temperature decreased (P less than 0.05). Rectal temperature remained unchanged due to the mild cold. In all of the above parameters, there were no differences between treatments. Ingestion of the Colt Buster(TM) significantly increased carbohydrate oxidation compared to the placebo. However, this was without impact on M, since it occurred entirely at the expense of fat oxidation. Interestingly, the Cold Buster(TM) increased plasma glucose and insulin levels 2h into the cold. This secretion of insulin seems to have blunted lipid mobilization since it significatly reduced plasma free fatty acids levels. The result confirm previous data where the ingestion of the Cold Buster(TM) Sports bar did not alter heat production, heat losses, heat debt or even body temperatures, and extended these observations to a mild cold stress. DTIC

NASA SUPPORTING STUDIES FOR MICROGRAVITY RESEARCH ON EYE MOVEMENTS Final Technical Report, 1 Jan. - 31 Dec. 1990
Bernard Cohen 31 Dec. 1990 6 p
(Grant NAGw-1998)
(NASA-CR-193233; NAS 1.26:193233) Avail: CASI HC A02/MF A01

The purpose of the work on this project was to provide support for ground-based studies on the effects of gravity on eye movements. The effects of microgravity on the optokinetic eye movements of humans are investigated. OKN was induced by having subjects watch 3.3 deg stripes moving at 35 deg/s for 45 s in a binocular, head-fixed apparatus. The field (hor., 88 deg; vert., 72 deg), was rotated about axes that were upright or tilted 45 deg or 90 deg. The head was upright or tilted 45 deg on the body. Head-horizontal (yaw axis) and head-vertical (pitch axis) components of OKN were recorded with electro-oculography (EOG). Slow phase velocity vectors were determined relative to gravity. With the head upright, the axis of eye rotation during yaw axis OKN was coincident with the stimulus axis and the spatial vertical. With the head tilted 45 deg on the body, a persistent vertical component of eye velocity developed during yaw axis stimulation, and there was an average shift of the axis of eye rotation toward the spatial vertical of approximately 18 deg in six subjects. During oblique optokinetic stimulation with the head upright, the axis of eye rotation shifted 12 deg toward the spatial vertical. When the head was tilted, the axis of eye rotation rotated to the other side of the spatial vertical by 5.4 deg during the same oblique stimulation. This counter-rotation of the axis of eye rotation is similar to the 'Muller (E) effect', in which the perception of the upright counter-rotates to the opposite side of the spatial vertical when subjects are tilted in darkness. The data were simulated by a model of OKN. Despite the short OKAN time constants, strong horizontal to vertical cross-coupling was produced if the horizontal and vertical time constants were in proper ratio, and there was no suppression of nystagmus orthogonal to the stimulus direction. This shows that the spatial orientation of OKN can be due to a restructuring of the system matrix of velocity storage as a function of gravity. It is concluded that although human OKAN is weak, velocity storage orients the slow phase velocity of OKN towards the spatial vertical. Author (revised)

SUDDEN LOADING AND FATIGUE EFFECTS ON THE HUMAN SPINE Final Report

Daniel R. Baker and Donald S. Bloswick 16 Nov. 1992 54 p
(Grant PHS-R03-OH0-2821-01)
(PB93-167526) Avail: CASI HC A04/MF A01

The effects of fatigue and load magnitude on the in vivo torso response of human subjects to a sudden load were analyzed in six individuals. Parameter identification of the human spine was performed within a sudden loading, short duration, high intensity fatigue paradigm. The findings indicated that fatigue is an important factor under conditions of sudden loading. The fatigued subject does not respond in the same way as he does when not tired. It is suggested that a higher degree of injury would be expected under conditions of fatigue. Most of the time the worker is not at the point of fatigue, and performance of certain tasks is usually practiced under conditions which are better than those prevalent under conditions of fatigue. Two reports are being produced from the data gathered in the study. The first will examine the electromyographic responses of the individual and compare them to the dynamics of the torso. The second study will mathematically study the compression levels expected as a result of earlier work. The authors suggest that their most important finding was the ability to mathematically model a complex response of the torso to a sudden load with a simple second order linear model. The study demonstrated that short duration, high intensity muscular fatigue changes the way in which the torso responds to a sudden load. NTIS

A TUTORIAL ON EXIT PUPILS AND EYE ROTATION WITH VIRTUAL IMAGE OPTICAL DISPLAYS Interim Report, Aug. 1991 - Sep. 1992

Herschel C. Self Dec. 1992 37 p
(AD-A262399; AL-TR-1993-0010) Avail: CASI HC A03/MF A01

Exit pupils of virtual image optical displays and eye entrance pupils and how their sizes and relative positions influence light input to the eye are discussed. Equations based on simplifying assumptions about the eye and its rotational behavior are derived and graphed to describe the position of the center and edge of the eye entrance pupil after eye rotation and for the rotation angles at which exit pupil vignetting begins and at which vignetting is total. The graphs and equations are useful for descriptive purposes and for practical application in choosing, specifying or designing virtual image optical display devices. Worked out numerical examples are supplied to further aid in understanding pupils and eye rotation and how they interact. The reader is not required to have a background in optics or in college mathematics. DTIC

PROGRAMMABLE INTERACTIVE SYSTEM FOR COCHLEAR IMPLANT ELECTRODE STIMULATION Technical Report

Joseph Tierney, Marc A. Zissman, Donald K. Eddington, and William M. Rabinowitz 12 Jan. 1993 51 p
(Contract F19628-90-C-0002)
(AD-A262558; TR-970; ESC-TR-92-139) Avail: CASI HC A04/MF A01

The aim of this research, which was performed as a Lincoln Laboratory Innovative Research Program (IRP) project, was to apply advanced digital speech and signal-processing techniques toward improving cochlear implant electrode simulators. By providing a flexible stimulator whose function could be tuned depending on the subject's residual auditory nerves and the efficiency of the implant's coupling to those nerves, it was hypothesized that the subject's speech reception could be improved. The approach to providing these new and improved electrode stimulators included the design of a laboratory signal processor used for interactive testing of new algorithms with implant subjects. This Programmable Interactive System for Cochlear Implant Electrode Stimulation (PISCES) was designed, built, and tested at Lincoln Laboratory and then delivered to the Massachusetts Eye and Ear Infirmary (MEEI) Cochlear Implant Research Laboratory (CIRL). In collaboration with researchers at MEEI CIRL and MIT Research Laboratory of Electronics (RLE), new algorithms run on PISCES resulted in substantial improvements in subject speech reception relative to that with their current implant stimulators. These results were obtained as a result of interactive algorithm adjustment at the clinic, which demonstrated the importance of a flexible signal processor. DTIC

PHARMACOKINETICS AND PHARMACODYNAMICS IN SPACE

Lakshmi Putcha and Nitza M. Cintron Apr. 1990 31 p Workshop held in Houston, TX, 29-30 Aug. 1988
(NASA-CP-10048; NAS 1.55:10048) Avail: CASI HC A03/MF A01

The Pharmacokinetics and Pharmacodynamics Panel met on 29-30 Aug. 1988 at the Lunar and Planetary Institute in Houston, Texas to discuss pharmacokinetic and pharmacodynamic implications of space flight and make recommendations for operational and research strategies. Based on the knowledge available on the physiological changes that occur during space flight, the dependence of pharmacokinetics on physiological factors, and the therapeutic requirements for future space missions, the panel made several recommendations for research. It was suggested that using medications available with a large (wide) therapeutic window will avoid unforeseen therapeutic consequences during flight. The sequence for conducting research was outlined as follows: (1) identify ground-based simulation models (e.g., antiorthostatic bed rest) for conducting pharmacokinetic and pharmacodynamic research; (2) estimate parametric changes in these models using pharmacologic agents that have different pharmacokinetic characteristics and a narrow therapeutic index; (3) verify these findings during flight; and (4) develop and identify appropriate and effective drug delivery systems, dosage forms, and regimens. The panel recommended gaining a thorough understanding of the pharmacokinetic deviations of medications that have a narrow therapeutic index (e.g. cardiovascular drugs and sedative hypnotics) in order to ensure safe and effective treatment during flight with these agents. It was also suggested that basic information on physiological factors such as organ blood flow, protein composition and binding, tissue distribution, and metabolism by hepatic enzymes must be accumulated by conducting ground-based animal and human studies using models of weightlessness. This information will be useful to construct and identify physiologically based pharmacokinetic models that can provide valuable information on the pharmacodynamic consequences of space flight and aid in identifying appropriate therapeutic regimens. (Contract N00014-91-C-0190)
(AD-A262861) Avail: CASI HC A03/MF A01

The major objective of this quarter was to complete all patient data collection at Froedtert Lutheran Memorial Hospital (Medical College of Wisconsin), finalize all TAMM algorithms, integrate the new diagnostic software into the NIR-800 Array Analyzer and deliver the instrument to the Naval Health Research Center (NHRC) in San Diego, California. All of the above work activities were completed, and the NIR-800 was shipped to NHRC on March 9, 1993. Prior to shipment, test set runs on all 9 of the analytes were completed with the results shown in Table 1. All of the electrolytes recorded average errors of less than 6% of mean value with all except bicarbonate less than 4%. The reliable operating range of the system for each analyte is also indicated in Table 1. This limited range results from the lack of sufficient extreme values for all analytes except glucose. Even glucose by these standards is marginal because only a few values over 150 mg/dl were obtained during preclinical testing. Extension of this range to include abnormal values for each analyte will require additional data collection in an Intensive Care Unit (ICU) where extreme analyte concentration values are common. Data on 531 patients have been collected of which 514 were acceptable. Best results were obtained using the final 73 patients for whom data collection instrumentation and procedures were optimized. A description of the preliminary field instrument design is included in this report. DTIC

EVALUATION OF DRIED STORAGE OF PLATELETS FOR TRANSFUSION: PHYSIOLOGIC INTEGRITY AND HEMOSTATIC FUNCTIONALITY Annual Report No. 1, 1 Feb. 1992 - 31 Jan. 1993

Arthur P. Bode, Majorie S. Read, and Robert L. Reddick 31 Jan. 1993 9 p
(Contract N00014-92-J-1244)
(AD-A263240) Avail: CASI HC A02/MF A01

The intramural collaboration at East Carolina University to study metabolic activity of lyophilized platelets was cancelled after six months due to departure of the investigator. This study will now be carried out by colleagues at the American Red Cross Research Laboratory in Norfolk, VA. Samples of various platelet preparations were sent and analysis is underway. The major objectives achieved at ECU in the first year were initiation of long-term storage studies of the standard lyophilized platelet preparation, set-up of Baumgartner chamber methodology for assessment of platelet adhesiveness, and further development of permanganate-based stabilization protocols before platelet lyophilization. A long-term study of the stability of surface receptors on lyophilized platelets stored under various conditions (desiccated, at room temperature or 4 deg C, or frozen at -70 deg C) was initiated in June 1992, with a single large batch of paraformaldehyde-treated dried human platelets. At one month intervals, sample vials from each storage environment were reconstituted and assayed by flow cytometry with monoclonal antibody probes to the major surface glycoproteins. The only signigicant finding thus far is a decrease in binding of MoAb SZ-1 to the dried platelets stored at room temperature. DTIC

ISSUES ON HUMAN ACCELERATION TOLERANCE AFTER LONG-DURATION SPACE FLIGHTS

K. Vasantha Kumar (Krug Life Sciences, Inc., Houston, TX.) and William T. Norfleet Oct. 1992 55 p

(Contract NAS9-18492)

(NASA-TM-104753; S-686; NAS 1.15:104753) Avail: CASI HC A04/MF A01

This report reviewed the literature on human tolerance to acceleration at 1 G and changes in tolerance after exposure to hypogravic fields. It was found that human tolerance decreased after exposure to hypokinetic and hypogravic fields, but the magnitude of such reduction ranged from 0 to 30 percent for plateau G forces and 30 to 70 percent for time tolerance on sustained G forces. A logistic regression model of the probability of individuals with 25 percent reduction in +Gz tolerance after 1 to 41 days of hypogravic exposures was constructed. The estimated values from the model showed a good correlation with the observed data. A brief review of the need for in-flight centrifuge during long-duration missions was also presented. Review of the available data showed that the use of countermeasures (such as anti-G suits, periodic acceleration, and exercise) reduced the decrement in acceleration tolerance after long-duration space flights. Areas of further research include quantification of the effect of countermeasures on tolerance, and methods to augment tolerance during and after exposures to hypogravic fields. Such data are essential for planning long-duration human missions. Author (revised)

BETA-ADRENERGIC BLOCKADE AND LACTATE METABOLISM DURING EXERCISE AT HIGH ALTITUDE Final Report, 10 Jun. 1991 - 9 Dec. 1992

John T. Reeves 28 Jan. 1993 6 p

(Contract DAMD17-91-C-1112; DA Proj. 3M1-61102-BS-15)

(AD-A263544) Avail: CASI HC A02/MF A01

The primary thrust of this contract was to perform high altitude research on Pikes Peak Colorado (with the sea level phase to be done in Palo Alto) in the summer of 1991. The work was to test the hypothesis that the adreno-sympathetic system mediated many of the adaptations to high altitude, particularly the metabolic changes. DTIC

THE CHRONIC EFFECTS OF JP-8 JET FUEL EXPOSURE ON THE LUNGS Annual Technical Report, 1 Apr. 1992 - 1 Apr. 1993

Mark L. Witten 13 Apr. 1993 12 p

(Grant AF-AFOSR-0199-91)

(AD-A264162; AFOSR-93-0302TR) Avail: CASI HC A03/MF A01

The second year of this project concentrated on using a 'high' dose of JP-8 jet fuel in our exposure regimen. We selected a target dose of approximately 1,000 mg/cu m based on a published epidemiological study conducted at NATO Air Force Bases that demonstrated jet fuel concentrations as high as 1,020 mg/cu m during refueling operations. The rats in the 'high' dose studies were exposed to an average of 813.8 Mg/cu m for one hour/day for 7 and 28 days. In our previous work, a 'low' dose concentration of JP-8 jet fuel (500 mg/cu m) for one hour/day for 7 and 28 days did not show any significant changes in lung structures by light microscopy. However, when light microscopy was performed on lung sections from rats exposed to JP-8 jet fuel for 7 and 28 days at the 'high' dose concentration, the evidence for injury to the alveolar-capillary barrier was overwhelming. In these rats, we observed red blood cells in the alveolar air spaces, distortion of the bronchial airways, and loss of epithelial cells in the alveoli. These findings were substantiated by electron microscopy which showed epithelial cells missing their basement membrane, airways devoid of cilia, and alterations of type 2 alveolar epithelial cells. THE AFOSR WORKSHOP ON THE FUTURE OF EEG AND MEG Final Report, 1 Apr. 1992 - 30 Sep. 1992

John Wikswo, Jr., Alan Gevins, and Samuel J. Williamson 2 Feb. 1993 41 p Workshop held in Virginia Beach, VA, 17-22 May 1992 Prepared in cooperation with EEG Systems Lab, San Francisco, CA

(Contract F49620-92-J-0214)

(AD-A264338; AFOSR-93-0256TR) Avail: CASI HC A03/MF A01

A workshop on the prospects of the electroencephalogram (EEG) and the magnetoencephalogram (MEG) for elucidating human brain function was held at Virginia Beach, Virginia from 17-22 May 1992. The purpose of the workshop was to discuss the EEG and the MEG in relation to other rapidly advancing imaging modalities such as PET, SPECT, and functional MRI (MRI), and in terms of the recognized research, medical, and personnel evaluation needs for advanced brain imaging. Medical areas where these and other advanced technologies will undoubtedly be utilized include the diagnosis and treatment of diseases of the brain such as epilepsy, Alzheimer's, and schizophrenia; the monitoring and facilitation of recovery of function from head trauma and stroke; and the quantitative assessment of the effect on the brain of toxins and other bioenvironmental hazards. Non-medical applications of these techniques include a furthering of our understanding of the factors that are limiting the development and full utilization of human intelligence, particularly in recognition of increasing demands that are being placed on the mental capacities of people who live and work in our modern, post-industrial society. INTERMEDIATE LEVELS OF VISUAL PROCESSING Annual Report, 1 Oct. 1991 - 30 Sep. 1992

Ken Nakuyama 30 Sep. 1992 4 p

(Contract F49620-92-J-0016)

(AD-A264117; AFOSR-93-0308TR) Avail: CASI HC A01/MF A01

The following topics were discussed: (1) Developed a theory to explain perceived depth in untextured stereograms which relies on the principle of generic image sampling. (2) Conducted experiments on visual search and visual texture segregation which show that early filter outputs are not accessible to either of these two operations. (3) Discovered a new form of implicit memory which is uniquely shortlasting (approx 30 seconds) and which assists in enabling more speedy popout with repeated trials. (4) Developed a new theory of binocular vision which relies heavily on the importance identification of half-occlusions. DTIC

THE ENVIRONMENTAL SYMPTOMS QUESTIONNAIRE (ESQ): DEVELOPMENT AND APPLICATION Final Report, Sep. 1990 - Jun. 1992

James B. Sampson, John L. Kobrick, and Richard F. Johnson Mar. 1993 27 p

(DA Proj. 1L1-62786-AH-98)

(AD-A264127; NATICK/TR-93/026) Avail: CASI HC A03/MF A01

The Environmental Symptoms Questionnaire (ESQ) was developed to help researchers quantify symptoms experienced by individuals exposed to extreme conditions. The ESQ has evolved into a general symptom questionnaire from earlier designs for capturing the symptoms of acute mountain sickness. Item have been added, removed and revised, and scale changes were made for greater reliability and ease of administration and completion. Factor analysis revealed significant symptom clusters and weights for scoring the ESQ. Discussion is given to these developments and to the application to a number of environmental studies. Recommendations are offered for its administration and scoring using either factor weights or nonfactored clusters. DTIC

CONTROL AND CIRCADIAN BEHAVIOR BY TRANSPLANTED SUPRACHIASMATIC NUCLEI Final Report, 15 Nov. 1989 - 14 Nov. 1992
Michael Menaker 14 Nov. 1992 10 p
(Grant AF-AFOSR-0098-90)
(AD-A264553; AFOSR-93-0337TR) Avail: CASI HC A02/MF A01

Fetal SCN tissue transplanted into the third ventricle of hamsters bearing complete SCN lesions restores the circadian locomotor rhythm with a period that depends exclusively on the genetically determined period of the tissue donor. If the host is only partially lesioned and thus retains rhythmicity with its own genetically determined period, an implant from an animal of a different genotype can induce a second rhythm with a period determined by the donor genotype. Both rhythms can be present simultaneously in the record of such a temporal chimera, interacting only superficially (i.e., not at the level of the pacemaker). Our data support the interpretation that under such circumstances the graft is able to capture part of the locomotor output of the circadian system but does not make functional connections with the host SCN pacemaking system. The objective of this study was to develop a data acquisition system for the small animal centrifuge (SAC) and the transcranial Doppler (TCD) and to perform required research into the hemodynamic/biochemical alterations during G-induced loss of consciousness (G-LOC). This effort was to include the daily operation and maintenance of the SAC and Waters High Performance Liquid Chromatography units. The original data were turned over to the Flight Motion Effects Branch. The results of this effort were published as the article and abstracts included in this technical paper. DTIC

MOLECULAR APPROACH TO HYPOTHALAMIC RHYTHMS Annual Report, 15 Mar. 1992 - 14 Mar. 1993
J. G. Sutcliffe 14 Mar. 1993 25 p
(Contract F49620-92-J-0188)
(AD-A264438; AFOSR-93-0280TR) Avail: CASI HC A03/MF A01

We have utilized polymerase chain reaction with primers corresponding to conserved amino acid sequences within membrane-spanning regions of known serotonin receptors to identify clones of 4 putative new indoleamine receptors. We have determined complete amino acid sequences of these 4 receptors which fall into 3 subfamilies; two of these subfamilies are novel. The sites of expression within the brain have been determined for each of the genes. Expression in mammalian cells demonstrates that each new protein is a receptor for serotonin and each has a distinct pharmacology when compared to known receptors. Two of the new receptors are coupled to CAMP, one negatively (G) and one positively (Gs). The latter is a candidate for the serotonin receptor that mediates phase advances in circadian rhythms of the SCN. DTIC

A SIMPLE COMPUTATIONAL MODEL OF CENTER-SURROUND RECEPTIVE FIELDS IN THE RETINA
M. R. Blackburn Feb. 1993 17 p
(AD-A264723; NRAD-TD-2454) Avail: CASI HC A03/MF A01

This report discloses a simple computational model of the outer retinal layers. The algorithm incorporates both rectified on-center/off-surround and off-center/on-surround bipolar elements, and an increase in the convergence of receptors to output elements that accounts for resolution differences between central and peripheral vision. The phenomenon of even and odd symmetry observed in biological receptive fields can be reproduced by the response of the model system to a moving line. DTIC

DISCOMFORT GLARE FROM HIGH-INTENSITY DISCHARGE HEADLAMPS: EFFECTS OF CONTEXT AND EXPERIENCE
M. J. Flannagan, M. Sivak, D. S. Battle, T. Sato, and E. C. Traube Mar. 1993 31 p Sponsored by Industry Affiliation Program for Human Factors in Transportation Safety, Ann Arbor, MI
(PB93-174720; UMTRI-93-10) Avail: CASI HC A03/MF A01

The study was designed to investigate a difference in the discomfort glare produced by tungsten-halogen (TH) and high-intensity discharge (HID) headlamps. In a static field setup, 36 subjects, 24 in a younger group and 12 in an older group, made de Boer ratings of discomfort glare for TH and HID lamps. The lighting conditions were similar to those seen while driving on a dark, two-lane road when glare from an oncoming car is encountered. The results replicated the difference between TH and HID lamps that the authors observed in the earlier study, and indicated that the difference is not reduced by several manipulations of context and experience that the authors introduced in the present study. Analysis of subjects' discomfort ratings indicated that when TH and HID lamps produce equal discomfort glare, the tungsten-halogen lamps produce more photooptic lux at the eye of the observer. The magnitude of the difference was not affected by the type of headlamp (TH or HID) used on the car in which observers sat while viewing the glare stimuli, nor by whether the TH and HID lamps were presented in the context of headlamps that had been filtered to produce strongly saturated colors. CARBON MONOXIDE EXPOSURE OF SUBJECTS WITH DOCUMENTED CARDIAC ARRHYTHMIAS Research Report, Aug. 1987 - Jul. 1991
B. R. Chaitman, T. E. Dahms, S. Byers, L. W. Carroll, and L. T. Younis
Sep. 1992 48 p Sponsored by Health Effects Inst.
(PB93-179943; HEI/RR-92/52) Copyright Avail: CASI HC A03/MF A01

The authors studied 30 subjects with well-documented coronary artery disease who had an average of at least 30 ventricular ectopic beats per hour over a 20-hour monitoring interval. Subjects were selected and enrolled in a randomized double-blind study; the carbon monoxide exposure was designed to result in 3% or 5% carboxyhemoglobin levels, as measured by gas chromatography. Total and repetitive ventricular arrhythmias were measured for four specific time intervals: (1) two hours before carbon monoxide exposure; (2) during the two-hour carbon monoxide exposure; (3) six hours after carbon monoxide exposure; and (4) approximately 10 hours after exposure, or the remaining recording interval on the Holter monitor. There was no increase in ventricular arrhythmia frequency after carbon monoxide exposure, regardless of the level of carboxyhemoglobin or the type of activity. During steady-state conditions at rest, the number of ventricular ectopic beats per hour was 115 +/- 153 (SD) for room air exposure (0.7% carboxyhemoglobin), 121 +/- 171 for the lower carbon monoxide exposure (3.2% carboxyhemoglobin), and 94 +/- 129 for the higher carbon monoxide exposure (5.1% carboxyhemoglobin). The frequency of complex ventricular ectopy was not altered at the levels of carbon monoxide studied. Secondary analysis of the impact of carbon monoxide on ventricular ectopic beat frequency stratified by baseline ejection fraction, baseline ventricular ectopic beat frequency, and exercise-induced ST-segment changes did not indicate an effect of carbon monoxide on ventricular arrhythmias. However, patients with symptomatic ventricular arrhythmias and symptomatic myocardial ischemia were excluded from the present study. NTIS

FIELD TRIAL OF CAFFEINE ON PHYSICAL PERFORMANCE AT ALTITUDE: AN ATTEMPT TO OVERCOME THE CHALLENGE
Nancy King, Charles S. Fulco, Carol J. Baker-Fulco, Stephen Muza, and Timothy Lyons May 1993 52 p
(AD-A264260) Avail: CASI HC A04/MF A01

This study was designed to determine if caffeine would enhance the physical performance of soldiers at altitude (Pikes Peak, Colo.). Eight male soldiers from the Special Forces (ages 22 to 35 years old) completed two ascents of a 22 km, mountain trail (hiking from 1800 m to 4300 m above sea level) after having resided for 8 and 17 days at the summit (4300 m). Soldiers were asked to refrain from caffeinated foods and beverages for two days prior to each ascent. The composition and timing of the pre-ascent breakfasts were controlled. Ninety minutes after breakfast (one hour prior to ascent) each soldier received either caffeine (4 mg/kg body weight) or placebo in a double-blind, cross-over design. Urine samples were collected prior to each ascent for 1-methylxanthine determination. Perceived exertion, oxygen saturation, symptomatology, and 'split times' were measured at selected points along the trail. None of the variables measured differed between placebo and caffeine ascents. The inability to demonstrate an improvement due to caffeine may have been due to unavoidable, confounding factors such as inclement weather on the second ascent, altitude acclimatization between ascents, and/or lack of compliance to a caffeine-free diet, as well as the small sample size. AN ALGORITHM FOR SIMPLE AND COMPLEX FEATURE DETECTION: FROM RETINA TO PRIMARY VISUAL CORTEX Final Report
M. R. Blackburn Feb. 1993 30 p
(AD-A264306; NRAD-TD-2456) Avail: CASI HC A03/MF A01

This report describes a hierarchy of functions for the processing of visual motion and pattern information culminating in descriptive sets of features. Processing elements that model simple feature detectors respond maximally only when a stimulus grating pattern with a specific orientation and spatial period is located in phase with the center and surround of the element's receptive field. Processing elements that model complex feature detectors respond maximally only when a stimulus grating pattern with a specific orientation and spatial period is moved in a specific direction through the element's receptive field. PHOTORECEPTORS REGULATING CIRCADIAN BEHAVIOR: A MOUSE MODEL Annual Report, 15 Mar. 1992 - 14 Mar. 1993
Russell G. Foster 14 Mar. 1993 19 p
(Contract F49620-92-J-0205)
(AD-A264881; AFOSR-93-0352TR) Avail: CASI HC A03/MF A01

Recent studies examined circadian photoreception in mice with hereditary retinal disorders (rd/rd and rds/rds). Despite the loss of visual function in these mice, circadian responses to light remain unaffected. Using c-fos expression within the SCN as a marker of neural activation of the circadian entrainment pathway, identical levels of Fos in the SCN of rd/rd and +/+ mice in response to retinal illumination are found. On the basis of action spectrum studies, and measurements of photopigment retinoids using HPLC, it is believed the photopigment mediating circadian responses to light is based upon an opsin, and that 11-cis-retinaldehyde is the photopigment chromophore. Preliminary measurements of mouse rod opsin, blue cone, and green/red cone opsin mRNA in retinally degenerate mice suggest that none of these opsins are exclusively used to mediate circadian responses to light. Collectively our data suggest that circadian photoreception can be maintained by a very small number of rod or cone cells without outer segments, or alternatively, is performed by an unrecognized class of photoreceptive cell within the mammalian retina. ACCIDENT PRONENESS: A RESEARCH REVIEW Final Report
Mark D. Rodgers and Robert E. Blanchard May 1993 6 p
(DOT/FAA/AM-93/9) Avail: CASI HC A02/MF A01

Accident proneness is a concept that refers to an enduring or stable personality characteristic that predisposes an individual toward having accidents. The concept is controversial and has sustained a lively debate in the literature over the past 75 years. For the most part, though, continual interest has been fueled by poor experimental procedures, misinterpretation of previously reported results, the need to assign blame to individuals, and a rather curious doggedness in attempting to establish a relationship between accidents and personality traits, despite the lack of supporting scientific evidence. The origins of the notion of accident proneness are reported and the studies that purport to support or refute it are reviewed.

EXPERTISE, TEXT COHERENCE, AND CONSTRAINT SATISFACTION: EFFECTS ON HARMONY AND SETTLING RATE Quarterly Report
Bruce K. Britton and F. J. Eisenhart 8 Mar. 1993 10 p
(AD-A262703) Avail: CASI HC A02/MF A01

This paper reports four experiments showing that 27 experts' mental representations had significantly higher harmony and faster settling rates than 652 novices when activation was spread through the representations in a simulation of thinking; that when coherent texts were read by novices, they produced mental representations with significantly higher harmony and faster settling rates than less coherent texts; and that novices whose representations matched the experts' mental representations had significantly higher harmony and faster settling rates. The results were found for declarative experts in history and procedural experts in literary interpretation, for Dutch and American experts, for novice groups including U.S. Air Force recruits and U.S. and Dutch undergraduates, and for both history texts and literary texts. These results were consistent with our hypothesis that the quality of a person's prior knowledge determines the harmony and settling rates of their representations and that these can be measured by simulating the spread of activation through the person's mental representation of a subject matter domain. Harmony may also be used as a metacognitive signal.

PILOT CANDIDATE SELECTION METHOD (PCSM): WHAT MAKES IT WORK? Interim Report, Jan. - Dec. 1992
Thomas R. Carretta and Malcolm J. Rice Mar. 1993 17 p
(AF Proj. 7719)
(AD-A262871; AL-TP-1992-0063) Avail: CASI HC A03/MF A01

A sample of 678 Air Force pilot training candidates were tested with a paper-and-pencil aptitude battery and computer-administered tests of psychomotor skills, information processing, and attitude toward risk. A self report of flying experience was also collected. These data were used in regression analyses to determine which variables provided the best prediction of two flying criteria, passing-failing flying training and class ranking at the end of flying training. The paper-and-pencil tests were found to be the best predictors. The measures of flying experience, psychomotor skills, and attitude toward risk incremented the prediction of the criteria. Information processing was not found to be incremental to the other variables in the prediction of the criteria.

AN ACCELERATED TRAINING METHOD FOR BACK PROPAGATION NETWORKS Patent
Robert O. Shelton, inventor (to NASA) 13 Jul. 1993 21 p Filed 17 Jun. 1991 Supersedes N91-28730 (29 - 20, p 3381)
(NASA-Case-MSC-21625-1; US-Patent-5,228,113;
US-Patent-Appl-SN-716182; US-Patent-Class-395-23;
Int-Patent-Class-G06F-15/18) Avail: US Patent and Trademark Office

The principal objective is to provide a training procedure for a feed forward, back propagation neural network which greatly accelerates the training process. A set of orthogonal singular vectors are determined from the input matrix such that the standard deviations of the projections of the input vectors along these singular vectors, as a set, are substantially maximized, thus providing an optimal means of presenting the input data. Novelty exists in the method of extracting from the set of input data, a set of features which can serve to represent the input data in a simplified manner, thus greatly reducing the time/expense to training the system.

HANDEDNESS AND MOTOR PROGRAMMING EFFECTS OF MANUAL CONTROL AND MOVEMENT Final Report, Sep. 1987 - May 1991
David Curry Sep. 1992 134 p
(AD-A264022; AL-TR-1992-0127) Avail: CASI HC A07/MF A02

Four studies with a unidimensional, cursor-positioning task, employing both response-priming and response-precuing techniques, were performed to evaluate differences in motor control between the preferred and nonpreferred hands. None of the major hypotheses proposed previously to explain these differences (e.g., ones based on practice, force variability, feedback-processing speed, hemispheric specialization, and sequential movement control) was supported. Instead, hand differences may stem from greater automaticity during the execution of motor programs for moving by the preferred hand. Furthermore, the present studies do not support the distinctive-features model of motor programming proposed by Rosenbaum and other investigators. Such programs appear to be hierarchically organized and serially executed, with information about movement direction required before movement information is used. This conclusion is consistent with results obtained during both the initial programming of aimed movements and their reprogramming when the original information for them turns out to be incorrect. COMPUTING WITH NEURAL MAPS: APPLICATION TO PERCEPTUAL AND COGNITIVE FUNCTION Annual Report, 1 Aug. 1990 - 30 Jul. 1991
Eric L. Schwartz 26 Mar. 1993 4 p
(Grant AF-AFOSR-0275-88)
(AD-A264056; AFOSR-93-0314TR) Avail: CASI HC A01/MF A01

Models for visual attention, based on the representation of an attentional space as a two dimensional map have led to a model of visual attention which has been successfully used in the application of a space-variant active vision system, described below. Also, it has been demonstrated that stereo fusion limits, such as Panum's fusional area, scale in a manner which is determined by the size of a cortical hypercolumn, and the local value of cortical magnification factor. This in turn supports the notion that stereo disparity is computed by a local correlational operator defined on the span of a single pair of ocular dominance columns. A generalized image warp technique has been developed, which we term the 'protocolumn algorithm', which provides image level models of the mapping of ocular dominance and orientation column systems at the level of primary visual cortex. Finally, many of the ideas developed in this project have reached fruition in the construction of a space-variant active vision system. An initial prototype system has been constructed under hardware support from DARPA, and a number of difficult algorithmic problems in motor control, attention, space-variant image processing, and space-variant pattern classification, have begun to be studied. REPRESENTATIONS OF SHAPE IN OBJECT RECOGNITION AND LONG-TERM VISUAL MEMORY Annual Report, 15 Jan. 1992 - 14 Jan. 1993
Michael J. Tarr 11 Feb. 1993 31 p
(Contract F49620-92-J-0169)
(AD-A264342; AFOSR-93-0237TR) Avail: CASI HC A03/MF A01

A variety of studies examining the mechanisms and representations underlying human object recognition have been conducted. One track has investigated the role of view-based object representations in perception and recognition. Results indicate that certain classes of viewpoint-dependent features may be used to define boundaries between characteristic views of objects. A second track has investigated the interaction between orientation-dependent and orientation-independent recognition mechanisms. Results here indicate that humans learn both object-based, orientation-independent and view-based, orientation-dependent representations regardless of the initial learning context. Other results indicate that task conditions mediate whether structural descriptions or episodic representations of objects are used in performing an implicit memory task. Finally, a third track has investigated the nature of spatial relations between objects, as well as the relationship between perceptual and lexical representations of spatial relations. Results indicate that spatial prepositions (e.g., above, left) encode the relationship between figural and reference objects as a gradient that decreases with distance from the qualitative or veridical position. Moreover, results indicate that this may in part be a lexical effect, in that stronger qualitative effects are found when subjects have lexically encoded the relationship--although further results indicate that qualitative gradients are present in purely perceptual judgments. FIELD TEST OF A COMPUTER-DRIVEN TOOL TO MEASURE PSYCHOLOGICAL CHARACTERISTICS OF AIRCREW Final Technical Report, 15 Nov. 1991 - 15 Nov. 1992
Christopher F. Flynn, Walter E. Sipes, Milton J. Grosenbach, and Jon Ellsworth Mar. 1993 36 p
(AD-A264484; AL-TR-1992-0171) Avail: CASI HC A03/MF A01

Twenty-eight (80%) subjects from a squadron of 36 F-16 pilots voluntarily participated in a newly developed anonymous, self-administered, computerized testing protocol. The test battery consisted of two 2.5-hour blocks that measured personality (MMPI-2), cognitive capacity (MAB), crew coordination skills (PCI), and potential psychiatric diagnoses (C-DIS); it also gathered demographic information. A peer rating survey gathered information about the squadron's top performers and their personal qualities. This pilot project demonstrated the success of the battery to gather aircrew information in a field location. Results also indicated that aviators can agree who are top performers and what personal qualities are important in top performers. DTIC

CONSPICUITY OF AIDS TO NAVIGATION. PART 1: TEMPORAL PATTERNS FOR FLASHING LIGHTS
Kevin Laxar and Sandra L. Benoit 3 May 1993 15 p
(Contract MIPR-Z51100-1-E27A57)
(AD-A264626; NSMRL-1187) Avail: CASI HC A03/MF A01

Mariners frequently have trouble picking out lighted aids to navigation in harbors and other areas that have a high density of background lights. The U.S. Coast Guard is seeking ways to enhance the conspicuity, or likelihood of being noticed, of these aids. Literature has shown that a flashing light is more conspicuous than a light that is not flashing. This investigation sought to improve conspicuity by finding the optimal flash characteristics for a light on a background of steady lights. Twenty observers searched for a flashing point source of light among backgrounds of steady lights of various numerosities on a computer controlled CRT screen. They indicated which of the five screen sectors contained the flashing target, and the computer recorded the accuracy and response time. Targets were flashed at the rates of 1, 2, and 3.85 Hz, each at duty cycles of .3, .5, and .8 (proportion of total time on). After a brief practice period, each observer completed 360 trials in a single one-hour session. An ANOVA showed significant effects of frequency, duty cycle, and background light density. Search time increased as the number of background lights increased. Conspicuity improved as frequency increased and as duty cycle decreased. The flash pattern that provides the greatest conspicuity consumes the least amount of electrical energy, an important consideration for an aid to navigation. The results can be used as guidelines for the flash characteristics of lighted aids to navigation. DTIC

EFFECTS OF AREA-OF-INTEREST DISPLAY CHARACTERISTICS OF VISUAL SEARCH PERFORMANCE AND HEAD MOVEMENTS IN SIMULATED LOW-LEVEL FLIGHT Final Technical Report, Sep. 1989 - Jul. 1992
Harold D. Warner, Gary L. Serfoss, and David C. Hubbard Mar. 1993 37 p
(Contract F33615-90-C-0005)
(AD-A264661; AL-TR-1993-0023) Avail: CASI HC A03/MF A01

An investigation was conducted to evaluate the influence of area-of-interest (AOI) display characteristics on target detection performance and head movements. Two AOI display conditions were compared: a small

(26.44 by 21.51 deg horizontal and vertical), higher resolution AOI and a large (40.00 by 30.00 deg horizontal and vertical), lower resolution AOI. The observers viewed a computer-generated visual scene consisting of three-dimensional cylinder-shaped objects placed upright on a desert like terrain surface. Black bands were modeled on some of the cylinders, and the bands constituted the targets. Cylinders height and diameter were varied along with the position of the banded cylinders relative to the flight path of the simulated aircraft. Both pilots and nonpilots were used as observers. Results indicate that target detection distance varied as a function of AOI condition and the height and diameter of the cylinders on which the bands were placed, but not type of observer. Both horizontal and vertical head movements were sensitive to the differences between the AOI conditions, and the vertical movements were also influenced by type of observer. It is recommended that the small, higher resolution AOI be used in situations where greater target detection distance and higher image detail are required. DTIC

THE DYNAMICS OF VISUAL REPRESENTATION, ATTENTION, ENCODING, AND RETRIEVAL PROCESSES Final Report, 1 Oct. 1990 - 30 Oct. 1992
Saul Sternberg 20 Apr. 1993 12 p
(AD-A264674; AFOSR-91-0015; AFOSR-93-0339TR) Avail: CASI HC A03/MF A01

The Final Technical Report on the dynamics of visual representation: attention, encoding, and retrieval processes is presented. After a section describing the objectives of the work, the report provides a synopsis of the principal accomplishments, in five categories: (1) investigation of the relation between location-probe and probed-reciting paradigms, to test whether the transformations that underlie performance changes with probe delay in the two paradigms are the same or different; (2) investigation of the transformation associated with the location-probe paradigm; (3) extensive work with the probed-reciting paradigm at zero probe delay, manipulating the legibility of the displayed characters as another approach to studying the transformation required for response; (4) application of variants of a traditional visual search paradigm to investigate effects of properties of the early representation on the order of search, again by manipulating legibility; (5) development of new tests of stage models of mental operations. DETERMINANTS OF PERFORMANCE RATING ACCURACY: A FIELD STUDY Interim Report, Jan. 1990 - Dec. 1992
Mark S. Teachout and Terry L. Dickinson Apr. 1993 93 p
(AD-A264726; AL-TP-1993-0010) Avail: CASI HC A05/MF A01

The purpose was to investigate the influence of rater and ratee characteristics, performance constraints, and rating system acceptability on the accuracy of supervisory performance ratings in a field setting. Participants were 212 raters and 405 ratees across three jobs in the United States Air Force. An hypothesized structural model of rating accuracy was tested using LISREL 7 to determine the relationships among nine latent variables. Although the goodness-of-fit statistics for the model were considered marginal, results indicated that motivation to rate accurately, trust in the appraisal process, rating form acceptability, rater cognitive ability, rater experience, and ratee experience were related to rating accuracy. Interpretations and suggestions for future research were discussed. DTIC

Investigation of concepts for generating oxygen on-board combat aircraft and development of a bleed air-driven refrigeration, liquefaction, and cryogenic storage system for oxygen were undertaken in this study. A number of alternative approaches were examined while considering size, weight and power consumption. An open-loop bleed air-driven system was selected for design, development, and testing. The bleed air-driven refrigeration unit achieved oxygen liquefaction temperatures of 90 deg K and liquefied and stored oxygen generated from a molecular sieve oxygen generating system (MSOGS). The oxygen was stored in cryogenic dewars, vaporized, and withdrawn from the system to simulate aircrew consumption. A heat exchanger flow reversing valving system was used to sublime and blow out condensates (water vapor and carbon dioxide) which normally collect in an open-loop refrigeration cycle operating from ambient air. The collection of condensate in the cryogenic system represented the largest technological area to overcome, and the reverse cycle system overcame the problem. The laboratory demonstrator utilized a helium cycle cold head refrigeration unit in conjunction with a J-T valve to simulate a cryogenic expander to be used in the flight system. Further work to incorporate a cryogenic expander in place of the cold head and J-T valve is recommended. DTIC

This report contains two papers presented at the Helmet-Mounted Displays IV, International Symposium and Exhibition on Optical Engineering and Photonics, held at Orlando, FL on 20-24 April 1992. This symposium was sponsored by the Society of Photo-Optical Instrumentation Engineers (SPIE). The papers describe the development and demonstration of two helmet-mounted displays: a low-cost monochrome helmet display and a low-cost color helmet display, both with see-through optics. The present monochrome CRT display helmet design, through demonstrations and system measurements, provided positive data as a research device. The color LCD helmet display system was successfully completed and although the resolution of the LCD matrix structure is not suited for the application of small text in the presentation, the high contrast and vivid colors produced by the LCD, as well as the see-through function of the optics, provide the capability for a full field-of-regard visual simulation system which can be used in conjunction with low-cost cockpit training devices. COMBAT AUTOMATION FOR AIRBORNE WEAPON SYSTEMS: MAN/MACHINE INTERFACE TRENDS AND TECHNOLOGIES [L'AUTOMATISATION DU COMBAT AERIEN: TENDANCES ET TECHNOLOGIES POUR L'INTERFACE HOMME/MACHINE]
Apr. 1993 268 p Symposium held in Edinburgh, Scotland, 19-22 Oct. 1992
(AGARD-CP-520; ISBN-92-835-0706-1) Copyright Avail: CASI HC A12/MF A03

Recent advances in combat automation technologies offer significant potential for improving overall mission effectiveness. Development of advanced situational awareness display concepts, parallel distributed computer architecture, and tactical information fusion techniques have paved the way for new operational capabilities and weapon system employment tactics. Harnessing these innovative technologies is critically dependent upon establishing an effective and intuitive pilot vehicle interface. The symposium addressed changing and possible future operational scenarios, advanced technology concepts, application issues and experimental development efforts and included sessions on: fusion, situation awareness, human capabilities and limitations, and design and evaluation of integrated systems. The X-31 Program is providing new options for conducting and winning close-in air combat in the future. Through the exploitation of the key EFM technologies - high thrust-to-weight ratio, multi-axis thrust vectoring, integrated flight-propulsion controls coupled with a 'pilot friendly' vehicle interface - the X-31 is pioneering dynamic post stall flight for a variety of combat applications. The key challenge to effective control in this arena is a compatible and properly tuned pilot-vehicle combination. The program's emphasis on control, simplicity, carefree handling, and situational awareness issues should help assure that its key objectives will be met. Various aspecs of the X-31 Program are discussed. Derived from text

Copyright Avail: CASI HC A03/MF A03

This paper describes the application of advanced technology, both hardware and software, to provide improved pilot Man-Machine Interface (MMI) automation for the central function of an airborne weapon system, namely weapon release. The specific scenario addressed is that of providing the pilot with decision aiding, in the form of firing cues, for the use of air-to-air missiles. The paper gives an overview of the need for automation/decision aiding in air-to-air missile fire control, by illustrating the way in which missile performance can vary greatly with the changes of engagement parameters which occur rapidly in an air-to-air combat scenario. The high pilot workload in this type of scenario, and the future requirement for multiple simultaneous missile firings, further support the need for automation to provide pilots with simple, processed, predictive data on which to base their firing decisions. In the next century, combat aircraft will be even more complex than those planned as current replacements; this is to counter increasingly competent aggressors, who may operate anywhere in the world. This paper covers the integration of a mission management aid (MMA) into future combat aircraft, its operation, the core topics of Sensor Fusion, Situation Assessment (including Dynamic Threat Assessment), Planning and Tactical Routing (with Defense/Attack Options Management). Evaluation of the MMA is showing that better situation awareness is obtained, increasing mission effectiveness and survivability, and that overall the MMA is a vital integral system for future aviation. PILOT INTENT AND ERROR RECOGNITION AS PART OF A KNOWLEDGE BASED COCKPIT ASSISTANT

T. Wittig and R. Onken *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 10 p (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A02/MF A03

A Pilot Intent and Error Recognition module as part of a knowledge based Cockpit Assistant System is presented, which is being developed at the University of the Armed Forces in Munich in cooperation with the Dornier company and implemented in a flight simulator. The system mainly supports the pilot crew with regard to the monitoring and planning task and provides assistance for a number of plan execution functions for the civil flight operation under Instrument Flight Rules. During the whole flight, the Pilot Intent and Error Recognition module monitors pilot activities and the flight status in order to detect deviations from the actual flight plan immediately. In this case, the current flight situation is evaluated, the pilot behavior is analyzed over a certain time period and by use of both pilot intent or error is recognized. Pilot errors lead to warning messages, and recognized pilot intent to a modification of the flight plan. In this paper, a short survey is given of the concept and the function of the Cockpit Assistant System. After that the structure of the Pilot Intent and Error Recognition will be described in detail. At the end, the integration of this module into the Cockpit Assistant System and the evaluation in a flight simulator are presented. Derived from text

THE DESIGN AND DEVELOPMENT OF THE NEW RAF STANDARD HUD FORMAT

J. R. Hall *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 11 p Sponsored by RAF (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A03/MF A03

In poor weather and on instruments, the safe piloting of an aircraft requires the display of basic flight information to the pilot in a manner that is instinctive, immediate, and unambiguous. Head-up display formats have singularly failed in this regard over the years and are known to be a contributing factor in many incidents involving lack of spatial awareness by the pilot. This paper describes the theory, experimental development, and flight proving of the DRA Fast-Jet HUD Format (FJF). This format has been designed to keep the pilot spatially aware under the most dynamic of flight maneuvers while retaining the flight-path information so necessary for mission effectiveness during normal tactical maneuvering and steady flight conditions. These include low level night operations with FLIR and NVGs and highly dynamic, hard maneuvering flight in poor weather or on instruments either at low level or in the air-to-air role. SYMBOLOGY FOR HEAD UP AND HEAD DOWN APPLICATIONS FOR HIGHLY AGILE FIGHTER AIRCRAFT: TO IMPROVE SPATIAL AWARENESS, TRAJECTORY CONTROL, AND UNUSUAL ATTITUDE RECOVERY, PART 1

G. Fischer and W. Fuchs *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 6 p (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A02/MF A03

The progressively increasing agility of modern fighter aircraft (a/c) with high onset and high sustained pitch and roll rates makes spatial orientation and awareness an even more demanding task for the operator. Pilots already complain about fast moving and twisting pitch bars in the HUD and the necessity to concentrate almost their entire attention on maintaining spatial orientation. Scaled and geared pitch bars relieved the problem to some extent but didn't solve it, at least according to our opinion. The above mentioned problems are aggravated with the introduction of advanced fighter a/c capable of even higher onset and angular rates and flying at higher angles of attack (AoA) or even in the post-stall regime where the actual flight path in space and the a/c attitude may deviate to a great extent. In order to overcome the problems mentioned above, a more stationary and more easily interpretable reference symbology, a circular arc segment, is used to indicate pitch (theta) or flight path angle (gamma), whereas the roll angle (phi) is given by the angular relation between a/c reference symbol and the center of the arc segment. VIRTUAL INTERFACE APPLICATIONS FOR AIRBORNE WEAPONS SYSTEMS

Emily Howard *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 6 p (For primary document see N93-28850 11-54)

This paper addresses a class of control and display technology that shall be referred to collectively as Virtual Interface (VI) technology. The contents of this paper are presented in three parts. Part 1 will describe what is meant by a 'virtual interface,' a suite of control and display technology being developed for future implementation in operational aircraft systems. The problem that will be discussed is how the transition process between development and operational status is particularly difficult for VI technology, given current applications. Part 2 will describe some new applications of VI technology, based upon several programs that utilize embedded simulation for operational test and evaluation and training purposes. A review of the benefits of VI technology shows promise for accelerating the transition process at least toward these operational activities. Part 3 then will describe a new display concept, based on virtual interface technology, that was designed for one of these embedded simulation applications and conclude with a discussion of plans for future development. A comprehensive flight test program of a head-steered FLIR/HMD night attack system was conducted between Aug. 1987 and Jan. 1990. Seventy-five development and demonstration F-16B flights were flown. Approximately 90 percent of the flights were conducted in night visual meteorological conditions. The remainder were conducted in daytime with the pilot's vision obscured by an opaque visor cover to simulate night and to study laser eye protection. Because the new FLIR/HMD systems were fully integrated with the F-16B fire control, navigation, communication, and display system, it was possible to achieve a considerable degree of tactical relevance in the tests. The night attack portion of the testing was a subset of a broader series of tests to explore advanced techniques for close air support (CAS). The work was industry sponsored by a number of corporations in a cooperative effort of about thirty million dollars. The tests and demonstrations culminated in operational test by (then) Tactical Air Command pilots at Nellis Air Force Base, Nevada, and Fort Hood, Texas. The night CAS systems evaluations were quite favorable and were planned for production until the remarkable end of the cold war reoriented (or perhaps gave pause to) planned introduction of the concepts to the fleet. In this paper, the author provides a summary overview of the mission, a description of the systems, the lessons learned, and some thoughts about future system requirements. Author (revised)

THE QUEST FOR AN INTEGRATED FLYING HELMET

A. Karavis and D. N. Jarrett *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 19 p (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A03/MF A03

The addition of vision enhancement, display, and control functions to aviator's headgear is operationally attractive. The jets and helicopters that are currently under development call for headgear with a combination of these novel facilities. This paper reviews the recent history of such helmet systems, which demonstrate admirably the inventiveness of the design teams. However, there are attendant perceptual and operational concerns and the addition of extra components invariably compromises basic ergonomic qualities. A new design philosophy, which emphasizes functional integration rather than the incorporation of compatible sub-systems, is emerging. This will be assisted significantly when key optical and electro-optical technologies become mature. Author (revised)

THE PHYSIOLOGICAL LIMITATIONS OF MAN IN THE HIGH G ENVIRONMENT

N. D. C. Green *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 8 p (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A02/MF A03

The physiological limitations imposed upon man by the high-G environment are discussed, with particular reference to the cardiovascular, respiratory, and musculo-skeletal systems. Anti-G technology has been developed specifically for agile fighter aircraft, but it is apparent that if man is to have the capacity to tolerate any further increases in aircraft agility, a radically different approach to G protection is required. The most effective physiological solution is to change the orientation of the pilot such that his long axis is no longer in the plane of greatest acceleration, entailing major cockpit redesign. This and other solutions are examined, and their acceptability to aviators is considered. Author (revised)

Virtual image displays are likely to become more prominent in the cockpit, the most common examples being the head-up display (HUD) and, more recently, the helmet-mounted display (HMD). This paper describes a series of experiments highlighting some of the advantages and disadvantages of displays of this type. The first experiments demonstrate that introducing perceived depth differences into displays may improve eye-tracking performance. The second series of experiments illustrates some of the problems with virtual image displays; namely that the eyes may be inappropriately accommodated (focused) when using virtual image displays. The possible consequences of these problems are discussed. Author

Achieving high situation awareness (SA) is a major goal in the design of aircraft systems. Efforts are currently underway by a number of individuals who are attempting to address this need through improvements in avionics system design, automation, and the pilot-vehicle interface (PVI). These efforts can be greatly enhanced through an understanding of human capabilities and limitations in achieving SA. This paper presents an identification of those factors which underlie basic human SA capabilities, including key information processing mechanisms, critical human skills, and a discussion of external factors which act to hamper SA. The implications of each of these issues for the design of systems, including PVI and automation efforts, are discussed. Author

OPERATOR AND AUTOMATION CAPABILITY ANALYSIS: PICKING THE RIGHT TEAM

R. M. Taylor and S. J. Selcon *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 17 p (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A03/MF A03

A review of the role of operator and automation capability analysis in aircrew systems design is provided. The changing perceptions of human and machine functionality with increasing machine capability, from early pilot-in-the-loop control, through to the division and sharing of responsibilities for systems management and mission problem solving, are charted. Concepts for the integration of human and machine resources in the performance of physical and cognitive tasks, including decision-making, are discussed in the context of developments in machine intelligence. Operator capability and task analysis, and the modeling of human performance, are seen to have developed from providing tools for system design, to giving critical support for real-time dynamic function allocation in advanced adaptive systems. A model of cooperative teamwork, with the machine conceived of as an electronic-crew teaming resource, is proposed as broad framework for thinking about future adaptive systems requirements. The results of a recent study of human-electronic crew teamwork with RAF Harrier and Tornado aircrew are reported. The results provide evidence for the validity of the teamwork model, and indicate directions for extending the capability for cooperative functioning in future aircrew adaptive systems. COGNITIVE INTERFACE CONSIDERATIONS FOR INTELLIGENT COCKPITS

Robert G. Eggleston *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 16 p (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A03/MF A03

The concept of an Intelligent Cockpit as a knowledge-based aiding system is presented. It argues that, in order to maximally support the air crew, user aiding in two areas is required: mission task aiding and interface useability aiding. These areas of aiding are discussed in relation to four different forms of an intelligent cockpit. The central purpose, however, is to introduce the concept of a cognitive design requirement for aiding systems, and to suggest its importance to design solutions expected to achieve crew aiding in both the mission task and interface useability areas. Two arguments are made: (1) A deeper knowledge of human capabilities and limitations is needed to generate effective cognitive design requirements for an aiding system; and (2) more cognitive design requirements are needed for an intelligent cockpit in comparison with a conventional one. Illustrations of possible cognitive design requirements are presented in support of these arguments. Special attention is given to requirements that derive from human capabilities and limitations. Based on the general discussion, it is also concluded that an intelligent cockpit should be a separate module from the traditional systems avionics, since it requires a unique process architecture. ERGONOMIC DEVELOPMENT OF DIGITAL MAP DISPLAYS

Adrian Martel and George A. Ward *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 8 p (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A02/MF A03

In the high workload environment of the cockpit, the importance of efficient transfer of information from visual displays to the pilot is of the highest priority. British Aerospace, Kingston, has developed a prototype Situational Awareness display which successfully combines tactical information with a digital map and aeronautical information. The interface in terms of presentation and functionality is designed to complement the process whereby visual information is cognitively integrated into mental models of Situational Awareness by the user. The development of the display involved a comprehensive literature search on perception and cognition, analysis of map representations, and an iterative evaluation whereby successive prototypes were developed and refined. The many visual design principles which were identified during this work which were successfully incorporated into this display and which may in addition be of great benefit to other displays are detailed. Where displays are being radically revised, a holistic redesign from first principles is preferable to simply adding new features. Author (revised)

Unconstrained low-altitude night attack is achievable today through automation and integration of current technologies. Many of these technologies are advanced avionic systems that still require additional development before they are production-ready. However, their performance and synergistic benefits have been demonstrated. Additional efforts are still warranted to increase system safety, improve situational awareness, decrease pilot workload, and provide a more effective weapon system. Author

The complexity of modern military simulations poses a formidable debriefing task. A study was therefore conducted to demonstrate feasibility of an evaluation aid system for close air-to-air combat analysis. This analysis is based on a new concept of Time Interval Characterization (TIC). This concept is an extension of the method of breaking down a combat sequence into individual maneuvers. The TIC concept is also generic enough to ensure that the proposed aid system is adequate for every type of mission, and not only in the very specific domain of aircraft close-in combat. The analysis system does principally: (1) a measurement of pilot performance; (2) an extraction of characteristical intervals; (3) a detection of good or bad behavior according to expertise rules of debriefing; and (4) an optional generation of alternative trajectories by an aircraft combat expert system. Results obtained during these stages can be fully exploited with the interactive Man Machine Interface (MMI) which forms a part of the aid system. Expertise rules and MMI were defined in consultation with relevant experts. Author (revised)

The Flight Systems Development branch of the U.S. Army's Avionics Research and Development Activity (AVRADA) and NASA Ames Research Center have developed for flight testing a Computer Aided Low-Altitude Helicopter Flight (CALAHF) guidance system. The system includes a trajectory-generation algorithm which uses dynamic programming and a helmet-mounted display (HMD) presentation of a pathway-in-the-sky, a phantom aircraft, and flight-path vector/predictor guidance symbology. The trajectory-generation algorithm uses knowledge of the global mission requirements, a digital terrain map, aircraft performance capabilities, and precision navigation information to determine a trajectory between mission way points that seeks valleys to minimize threat exposure. This system was developed and evaluated through extensive use of piloted simulation and has demonstrated a 'pilot centered' concept of automated and integrated navigation and terrain mission planning flight guidance. This system has shown a significant improvement in pilot situational awareness, and mission effectiveness as well as a decrease in training and proficiency time required for a near terrain, nighttime, adverse weather system. AVRADA's NUH-60A STAR (Systems Testbed for Avionics Research) helicopter was specially modified, in house, for the flight evaluation of the CALAHF system. The near terrain trajectory generation algorithm runs on a multiprocessor flight computer. Global Positioning System (GPS) data are integrated with Inertial Navigation Unit (INU) data in the flight computer to provide a precise navigation solution. The near-terrain trajectory and the aircraft state information are passed to a Silicon Graphics computer to provide the graphical 'pilot centered' guidance, presented on a Honeywell Integrated Helmet And Display Sighting System (IHADSS). The system design, piloted simulation, and initial flight test results are presented. Author (revised)

With the emergence of thrust-vectoring aircraft such as the X-31 and F-22, new questions arise regarding the maximum potential of this technology for increasing air-to-air combat effectiveness. Recent dome-to-dome (man-in-the-loop) simulations have demonstrated a significant increase in close-in air combat effectiveness with the addition of thrust vector capability. Much of this increased effectiveness can be attributed to the ability of the thrust-vectoring aircraft to continue maneuvering while operating well beyond conventional aircraft stall limits. Such poststall maneuvering (PST) can dramatically increase an aircraft's turn rate while simultaneously minimizing its turn radius, providing a significant tactical advantage in close in air combat. Comparisons with all-digital (computer-in- the-loop) simulations under the same test conditions, however, show that the combat effectiveness of PST is consistently greater within the all-digital analyses than within the all-manned analyses. These comparisons are summarized and whether pilots may require supplemental assistance in order to exploit the full potential of PST utility is considered. Through analysis of both man- and computer-in-the-loop combat simulations, requirements for pilot assistance were tentatively identified, along with some of the methods applicable to meeting these requirements. These methods include expanded training, improved displays, and increased automation. The results of this analysis, based upon the studies available to date, are presented. Plans for further analysis and validation studies are described. Author (revised)

DESIGN CONSIDERATIONS FOR A NIGHT, AIR-TO-SURFACE ATTACK CAPABILITY ON A DUAL ROLE FIGHTER **c06**
Robert A. Hale, John J. Chino, L. Larkin Niemyer, John R. Jadik, and Barry E. Lightner *In* AGARD, Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies Apr. 1993 8 p Prepared in cooperation with Westinghouse Electric Corp., Orlando, FL (For primary document see N93-28850 11-54)
Copyright Avail: CASI HC A02/MF A03

The Falcon Knight design objective was to achieve a compact lightweight and affordable night air-to-surface attack capability for a small single seat dual role fighter. The design constraints were cost, performance, physical size, weight, aerodynamic impact, and ease of retrofit. An analysis of the mission and the pilot's tasks and workload during the mission revealed the need for two electro-optical lines-of-sight (LOS's). The first LOS, pilot age, is required to provide an uninterrupted night vision, or pilot age, capability for a high level of situational awareness at all normal pilot viewing angles. The second LOS, targeting, is to provide a simultaneous independent targeting capability for cueing, search, detection, recognition, fire control tracking, and/or weapon hand-off leading to the delivery of weapons on the target. The Falcon Knight forward looking infrared (FLIR) sensor is a unique optically multiplexed dual line of sight (LOS) Head Steered FLIR (HSF) which provides both pilot age and targeting LOS's simultaneously within the design constraints cited above. The Falcon Knight FLIR is also integrated with the aircraft's Fire Control Radar (FCR) to create an integrated FLIR/Fire Control Radar Multisensor. Westinghouse built a company funded Falcon Knight FLIR/Fire Control Multisensor Radar prototype. The prototype was evaluated in flight on the Westinghouse BAC 1-11 Avionics Test Bed aircraft. The United States Air Force is currently evaluating the Falcon Knight FLIR/Fire Control Radar Multisensor on the Advanced Fighter Technology Integration (AFTI) F-16 test aircraft at Edwards Air Force Base (AFB) California. BIOPHYSICAL MODEL FOR HANDWEAR INSULATION TESTING
W. R. Santee, L. A. Blanchard, S. K. Chang, and R. R. Gonzalez Mar. 1993 26 p
(AD-A262926; USARIEMT7-93) Avail: CASI HC A03/MF A01

Biophysical models of hands, feet, and full manikins are used for direct measurement of clothing insulation. Thermal resistance values (m(sup 2)K/W) were measured with a weather resistant and simplified 7 zone hand model with upgraded controls and then compared to values from a 22 zone articulated copper model. Insulation is calculated from the power demand required to maintain a selected surface temperature setpoint at known thermal gradient between the surface setpoint and the environment. For the new model, dry insulation values were 0.21 m(sup 2)K/W for the standard military trigger finger mitten and 0.12 m(sup 2)K/W for the light-duty shell. Values for the 22 section copper hand model were 0.23 and 0.14 m(sup 2)K/W, respectively. Both hand models provide replicable measurements of relative total handwear insulation. DTIC

CRUCIAL ROLE OF DETAILED FUNCTION, TASK, TIMELINE, LINK, AND HUMAN VULNERABILITY ANALYSES IN HRA
T. G. Ryan, L. N. Haney, and L. T. Ostrom 1992 20 p Presented at the Reliability and Maintainability Symposium, Atlanta, GA, 26-28 Jun. 1993
(Contract DE-AC07-76ID-01570)
(DE93-001923; EGG-M-92402; CONF-930661-1) Avail: CASI HC A03/MF A01

This paper addresses one major cause for large uncertainties in human reliability analysis (HRA) results, that is, an absence of detailed function, task, timeline, link, and human vulnerability analyses. All too often this crucial step in the HRA process is done in a cursory fashion using word of mouth or written procedures which themselves may incompletely or inaccurately represent the human action sequences and human error vulnerabilities being analyzed. The paper examines the potential contributions these detailed analyses can make in achieving quantitative and qualitative HRA results which are as follows: (1) creditable, that is, minimize uncertainty; (2) auditable, that is, systematically linking quantitative results and qualitative information from which the results are derived; (3) capable of supporting root cause analyses on human reliability factors determined to be major contributors to risk; and (4) capable of repeated measures and being combined with similar results from other analyses to examine HRA issues transcending individual systems and facilities. Based on experience analyzing test and commercial nuclear reactors, and medical applications of nuclear technology, an iterative process is suggested for doing detailed function, task, timeline, link and human vulnerability analyses using documentation reviews, open-ended and structured interviews, direct observations, and group techniques. Finally, the paper concludes that detailed analyses done in this manner by knowledgeable human factors practitioners, can contribute significantly to the credibility, auditability, causal factor analysis, and combining goals of the HRA. COMPUTERIZED ATMOSPHERIC TRACE CONTAMINANT CONTROL SIMULATION FOR MANNED SPACECRAFT
J. L. Perry Jun. 1993 171 p Sponsored by NASA, Washington
(NASA-TM-108409; NAS 1.15:108409) Avail: CASI HC A08/MF A02

Buildup of atmospheric trace contaminants in enclosed volumes such as a spacecraft may lead to potentially serious health problems for the crew members. For this reason, active control methods must be implemented to minimize the concentration of atmospheric contaminants to levels that are considered safe for prolonged, continuous exposure. Designing hardware to accomplish this has traditionally required extensive testing to characterize and select appropriate control technologies. Data collected since the Apollo project can now be used in a computerized performance simulation to predict the performance and life of contamination control hardware to allow for initial technology screening, performance prediction, and operations and contingency studies to determine the most suitable hardware approach before specific design and testing activities begin. The program, written in FORTRAN 77, provides contaminant removal rate, total mass removed, and per pass efficiency for each control device for discrete time intervals. In addition, projected cabin concentration is provided. Input and output data are manipulated using commercial spreadsheet and data graphing software. These results can then be used in analyzing hardware design parameters such as sizing and flow rate, overall process performance and program economics. Test performance may also be predicted to aid test design. Author

ANTHROPOMETRIC DATA FROM LAUNCH AND ENTRY SUITED TEST SUBJECTS FOR THE DESIGN OF A RECUMBENT SEATING SYSTEM
Lara E. Stoycos (Lockheed Engineering and Sciences Co., Houston, TX.) and Glen K. Klute Jun. 1993 29 p
(Contract NAS9-17900)
(NASA-TM-104769; S-720; NAS 1.15:104769) Avail: CASI HC A03/MF A01

Returning space crews to Earth in a recumbent position requires the design of a new seating system. Current anthropometric data are based on measurements taken while the subjects were unsuited and sitting. To be most accurate, it is necessary to design by measurements of subjects in the launch and entry suit in a recumbent position. Since the design of the recumbent seating system must meet the requirements of both 5th percentile Japanese female and 95th percentile American male crew members, a delta is reported rather than absolute measurements of the test subjects. This delta is the difference in the measurements taken with the subjects unsuited and sitting and those taken with the subjects suited and recumbent. This delta, representative of the change due to the suit, can be added to the existing Man-Systems Integration Standards (NASA-STD-3000) anthropometric data to project the measurements for 5th percentile Japanese female and 95th percentile American male crew members. A delta accounting for the spinal elongation caused by prolonged exposures to microgravity is added as well. Both unpressurized and pressurized suit conditions are considered. Background information, the test protocol and procedure, analysis of the data, and recommendations are reported. Author (revised)

ANTHROPOMETRIC SURVEY OF THE ASTRONAUT APPLICANTS AND ASTRONAUTS FROM 1985 TO 1991

Sudhakar L. Rajulu (Lockheed Engineering and Sciences Co., Houston, TX.) and Glenn K. Klute May 1993 96 p
(Contract NAS9-17900)
(NASA-RP-1304; S-718; NAS 1.61:1304) Avail: CASI HC A05/MF A01

The Anthropometry and Biomechanics Laboratory at the Johnson Space Center has been collecting anthropometric data from astronaut applicants since 1977. These anthropometric measurements had been taken from 473 applicants. Based on the position they applied for, these applicants were classified as either mission specialists, payload specialists, pilots, or observers. The main objective was to document the variations among these applicants and tabulate the percentile data for each anthropometric dimension. The percentile and the descriptive statistics data were tabulated and graphed for the whole astronaut candidate population; for the male and female groups; for each subject classification such as pilot, mission specialist, and payload specialist; and finally, for those who were selected as astronauts. HEAD MOUNTED DISPLAYS FOR VIRTUAL REALITY

Paul J. Hezel and Harry Veron Feb. 1993 49 p
(Contract F19628-89-C-0001)
(AD-A263498; MTR-93B0000015) Avail: CASI HC A03/MF A01

One of the goals in the development of Virtual Reality (VR) is to achieve total immersion where one sees and interacts with objects in a virtual world in the same way that one sees and interacts with the objects of the real world. One becomes immersed in another world through the sense of sight. Thus the technique of displaying a virtual environment determines, in part, the degree to which one can become transported out of the real world and into the virtual world. The developers of VR have utilized the head mounted display (HMD) as a means of displaying the virtual environment to the user. The HMD is not new but has seen widespread use as an information display in military aircraft. In an HMD, displays and imaging optics mounted on a headset provide a virtual image in front of the eyes. In the VR domain, this design provides the user with a view of the virtual environment while blocking out the user's real environment. A tracking device allows the computer to present a viewpoint corresponding to the user's head position and orientation, thus enabling freedom of movement for the user within the virtual environment. These and other characteristics enhance the total immersion capabilities of the HMB. DTIC

SOUND ATTENUATION CHARACTERISTICS OF THE STANDARD DH-132A AND SPH-4 HELMETS WORN IN COMBINATION WITH STANDARD ISSUE EARPLUGS

Ben T. Mozo, Linda S. Barlow, and Barbara A. Murphy Jan. 1993 19 p
(AD-A263011; USAARL-93-10) Avail: CASI HC A03/MF A01

The Health Hazard Assessment (HHA) of Army systems usually requires a review of noise and hearing protection associated with the systems used. Hearing protection for crews in combat vehicles is specified to be the DH-132A and, in some cases where noise levels are extremely high, earplugs are worn in combination with the helmet in order to provide adequate protection. Hearing protection for Army helicopter crewmembers is the SPH-4 helmet with a few exceptions. The attenuation data used for the HHA are measured at this Laboratory. This report incorporates the results of attenuation measurements of the SPH-4 and DH-132A helmets worn in combination with the standard Army issue earplugs. Earplugs used in the study were the single flange, triple flange, and yellow/white foam plug. DTIC

PERFORMANCE MEASUREMENT SYSTEMS: A BEST PRACTICES STUDY M.S. Thesis

Sandra K. Chachula Dec. 1992 106 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A262180) Avail: CASI HC A06

The purpose of this cost management research was the identification and analysis of internal performance measurement best practices which can serve as a benchmark for companies who seek to improve their performance measurement systems and competitiveness. The study used data that were previously collected from eleven diverse, high performing companies. This study identified twenty-one characteristics of performance measurement systems across eleven companies and across levels of management. The twenty-one characteristics have previously been identified in the performance measurement literature as characteristics necessary for organizations to maintain their competitive edge. The study, therefore, is confirmatory. The summary of performance measurement best practices identified in this study, then, can be used as a benchmark by organizations who seek to improve their performance measurement systems and their competitiveness. EVALUATION OF PERSONAL COOLING SYSTEMS IN CONJUNCTION WITH EXPLOSIVE ORDNANCE DISPOSAL SUITS

J. Frim and Andrew Morris Jun. 1992 71 p
(AD-A262862; DCIEM-92-31) Avail: CASI HC A04/MF A01

This study examined the capabilities of three technologies (a liquid cooled undergarment, a thickly-ribbed vest of hydrophylic nylon, and an air vest) to alleviate thermal strain in personnel working in Explosives Ordnance Disposal (EOD) clothing under environmental conditions of 18 C and 40% relative humidity (rh), 340 C and 40% rh, and 34 C and 80% rh. Simulated EOD tasks consisted of treadmill walking (10 min), unstacking/carrying/stacking weighted boxes (10 min), and a rest period (15 min) with the EOD helmet and jacket removed repeated for a target duration time of 90 min. Physiological data included rectal temperature, skin temperature, heart rate, sweat production and evaporation, metabolic rate, and subjective evaluations of thermal comfort and perceived exertion. The results indicated that wearing the EOD suit produces significant increases in thermal physiological strain over performing the same tasks in a standard station uniform. However, the liquid-cooled Exotemp personal cooling system was very effective in reducing that strain during heat exposure. Rectal temperatures, heart rates, and fluid losses (dehydration) were reduced back to values comparable to those when not wearing the EOD suit, while skin temperatures were actually lower with the cooling system than with only the station uniform. Subjects indicated reduced perceived exertion levels and improved thermal comfort when wearing the liquid-cooled garment with the EOD suit. In contrast, the ribbed vest and air vest showed no significant benefits with the EOD suit. It is concluded that the increase in thermal physiology strain, resulting from wearing the EOD suit during EOD work in hot environments can effectively be minimized by use of Exotemp personnel cooling system. PREDICTING RADIATION INDUCED PERFORMANCE DECREMENTS OF AH-1 HELICOPTER CREWS. VOLUME 2: EVALUATION OF MODELING AND SIMULATION TECHNIQUES FOR PREDICTING RADIATION INDUCED PERFORMANCE DECREMENTS Technical Report, 25 Sep. 1986 - 30 Nov. 1991

William A. Perez, Vaughan W. Inman, Joseph I. Peters, Robert R. Sanchez, and Robert W. Young 1 Mar. 1993 118 p
(Contract DNA001-86-C-0308)
(AD-A262872; DNA-TR-92-54-V2-Vol-2) Avail: CASI HC A06/MF A02

The effects of intermediate doses of ionizing radiation on Army helicopter crew performance are investigated. The analysis of performance on the Walter Reed Performance Assessment Battery (WRPAB), and the development of an initial model for the WRPAB using Multidimensional Scaling (MDS) techniques is documented. The WRPAB was used in a study where 20 AH-1 pilots (1) predicted the effects of various symptom complexes on their performance, (2) went through a 36-hour protocol to induce symptoms similar to symptoms that follow exposure to intermediate doses of radiation, (3) performed a simulated AH-1 mission before and after symptom induction, and (4) were administered the WRPAB approximately every 2 hours throughout the 36-hour protocol. MicroSAINT models for AH-1 tank engagements were developed that used PAB performance to predict AH-1 performance degradation. The results indicate that the WRPAB (or some other test battery) has utility for the prediction of operator performance as affected by stressors such as ionizing radiation. DTIC

HELMET VISOR SUPPORT APPARATUS Patent
Daniel J. Schmidt, inventor (to Navy) and John D. Jacks, inventor (to Navy) 12 Jan. 1993 11 p Filed 10 Dec. 1991
(AD-D015684; US-Patent-5,177,816; US-Patent-Appl-SN-805281; US-Patent-Class-2-424) Avail: US Patent and Trademark Office

Helmet visor support apparatus is provided which can move the visor between a raised and a lowered position by the operation of one hand. The apparatus comprises a visor support arm pivotally attached to the helmet at a pivot point for moving the visor between the raised and lowered positions. A positioning means is attached to the helmet at the pivot point and has at least two bores corresponding to the raised and lowered visor positions. A locking pin retractably engages either one of the bores in the positioning means to lock the visor support arm in position. A spring coiled around the locking pin normally biases the locking pin in engagement with one of the bores. A manually activatable retracting means is attached to the locking pin for retracting the locking pin from the one of the bores upon being manually activated, thereby allowing the visor support arm to pivot. The retracting means is supported on the visor support arm between the two ends thereof and is positioned to be activated by manual movement away from the pivot point and towards the visor. DTIC

ENGINEMAN STRESS AND FATIGUE: PILOT TESTS Final Report, Feb. 1991 - Jun. 1992
G. I. Kuehn Feb. 1993 74 p Sponsored by Federal Railroad Administration, Washington, DC, Office of Research and Development Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DTFR53-82-C-00254)
(PB93-175008; IITRI-E06641; FRA/ORD-92/17) Avail: CASI HC A04

In the pilot study, the effects of fatigue on the train handling performance and vigilance of four certified train service locomotive engineers was assessed while they operated the Federal Railroad Administration (FRA), Research and Locomotive Evaluator/Simulator (RALES). Subjects operated on an hourly cycle of 12 work-12 rest-8 work as a normal cycle followed by an hourly cycle of 12W-8R-8W the following week as a fatigue cycle. Subject activity diaries, scoring of various aspects of train handling, subject exit interviews, and observer's run observation notes were collected. Core body temperature and performance on a fitness for work measure were also recorded. The sleep records of the subjects were plotted and found to be atypical in comparison with those of non-engineer persons. The controlled, low interruption rest periods of the study may have been superior to the rest normally attained by the subjects, thus accounting for the failure to show differences between the two experimental conditions. The observed deterioration of performance regardless of schedule, coupled with the irregular sleep/work patterns of the subjects suggest continued research which focuses on sleep/work patterns and those performance related variables which were attendant on the decreases in performance in the pilot study. PLATFORM STAIR LIFT Patent Application
Bruce Weddendorf, inventor (to NASA) and Kosta Varnavas, inventor (to NASA) 22 Mar. 1993 21 p
(NASA-Case-MFS-28772-1; NAS 1.71:MFS-28772-1; US-Patent-Appl-SN-035345) Avail: CASI HC A03/MF A01

A motorized lift system for carrying a wheelchair user up or down a flight of stairs includes a platform sized to underlie and support a wheelchair and a person sitting thereon. The platform is driven upwardly or downwardly along one side of the stairway between the floors at the opposite ends thereof, in response to manual operation of a start/stop switch mounted on an upwardly projecting side rail portion of the platform, in a manner maintaining the platform in a horizontal orientation at all times. With the platform resting on the floor at the appropriate end of the stairs, a user simply rolls his wheelchair onto the platform and pushes the start button. This initiates the movement of the platform toward the opposite end of the stairs and also automatically closes guard rail structures at the opposite ends of the platform to retain the wheelchair thereon during platform movement. When the platform reaches the opposite end of the stairs, and is brought to rest on the floor adjacent thereto, the platform movement is automatically terminated and the guard rail structure opened. This permits the user to simply roll his wheelchair off the platform onto the floor and be on his way after comfortably and conveniently traversing the stairs on the platform. NASA

AN EVALUATION OF B-1B PILOT PERFORMANCE DURING SIMULATED INSTRUMENT APPROACHES WITH AND WITHOUT STATUS INFORMATION Final Report, Mar. 1991 - Jul. 1992
Bradley D. Purvis Sep. 1992 87 p
(AF Proj. 7184)
(AD-A263874; AL-TR-1992-0088) Avail: CASI HC A05/MF A01

The majority of aircraft incidents occur during the approach to landing phase of flight. Little research has been conducted that evaluates the efficiency of the instrument display format used by the pilots for the approach to landing. This research examined the effects of two Instrument Landing System display formats on the tracking performance of pilots in a B-1B simulator under varying crosswind and starting conditions. One display contained flight director command steering supplemented with raw glideslope and localizer data; the other display was the same minus the raw data. This research was based on the hypothesis that superior tracking performance would result with flight director and raw glideslope and localizer data on the Instrument Landing System display. The independent variables were as follows: display types, initial starting point, and wind. The dependent variables were as follows: glideslope deviation, localizer deviation, airspeed, roll rate variability, pitch rate variability, and altitude Above Ground Level. Twelve qualified B-1 pilots served as subjects in this simulation study, each subject flew a total of 16 Instrument Landing System approaches after practice. The two types of Instrument Landing System formats were evaluated under two wind conditions that began with two starting positions. DTIC

CATS EYES ADJUSTMENT PROCEDURES Final Report, Nov. 1992 - Jan. 1993
Joseph C. Antonio Apr. 1993 16 p
(Contract F33615-90-C-0005)
(AD-A264069; AL-TR-1993-0025) Avail: CASI HC A03/MF A01

Night vision goggles (NVGs) have been employed in a variety of aircraft for over 20 years; however, only recently has their application begun in fighter/attack aircraft. Research accomplished by the Night Vision Programs Office at the Aircrew Training Research Division of the USAF Armstrong Laboratory demonstrated the loss of NVG performance resulting from improper goggle adjustments. This report describes correct adjustment procedures for the CATS EYES NVG system currently being used by USAF, USN, and USMC fighter/attack pilots. The procedures described were developed so aircrews could take advantage of the adjustments available on the NVGs. Additionally, image descriptions are given to help aircrews evaluate NVG performance. Information on the necessary equipment/space needed for proper evaluation is also included. DTIC

UTILITY OF A GHOST HORIZON AND CLIMB/DIVE LADDER LINE TAPERING ON A HEAD-UP DISPLAY Final Report, Aug. 1991 - Aug. 1992
Lisa F. Weinstein and William R. Ercoline Apr. 1993 17 p
(DA Proj. 2930)
(AD-A264401; AL-TR-1992-0168) Avail: CASI HC A03/MF A01

As part of a United States Air Force (USAF) effort to standardize head-up display (HUD) symbology, an unusual attitude recovery task was employed to investigate the utility of a cue, the ghost horizon, that indicates the direction of the actual horizon when the climb/dive ladder (CDL) horizon line is not within the HUD field of view. Six HUD-experienced and 6 non-HUD-experienced military pilot subjects were used to determine whether there was improvement, with the ghost horizon, in ability to recover from nose-down unusual attitudes in a flight simulator. The ghost horizon was evaluated with 3 different CDL line configurations (tapered, nontapered, reverse tapered). In terms of accuracy of the initial stick input, the ghost-horizon configurations resulted in significantly better performance (about 11% better) than did the non-ghost-horizon configurations. The ghost horizon had no effect on initial stick input reaction time or total recovery time. The CDL line taper configuration did not affect accuracy, initial stick input reaction time, or total recovery time. Subjective data indicated that the pilots did not have a strong preference for any of the configurations. These findings suggest that the ghost horizon is a useful aid to unusual attitude recovery performance, and may reduce spatial disorientation. DTIC

VISUALIZATION TECHNIQUES FOR ANALYZING CONTROL OF HUMAN MOVEMENT: AFFINE MAPPINGS BETWEEN MULTI-DIMENSIONAL SPACES Ph.D. Thesis
Arthur Daniel Kuo 1993 124 p
Avail: Univ. Microfilms Order No. DA9309625

Control of human movement is difficult to study in part due to the number of muscles, joints, and degrees-of-freedom about the joints. Interpreting the commands generated by the central nervous system or the resultant motion generated by muscles is not possible without a method for reducing the number of variables examined. The goal is to develop and apply a method for understanding control of movement through visualization. This is made possible by examining the possible outputs of a system in terms of vectors composed of achievable accelerations and forces. The effect of many variables can then be seen in the final output, which is the summation of intermediate transformations. The visualization is predicated on a mathematical characteristic of the equations of motion, that they describe affine mappings. A theory of muscle function in terms of output vectors was developed and applied to the study of the action of muscles that cross more than one joint, a topic of contemporary interest in the biomechanics community. It was found that each muscle can be described in terms of its resultant output vector. Any presumed special qualities are due to the muscle's unique location rather than the number of joints it crosses, as had been previously thought. The theory of muscle function was also extended to encompass the set of all possible outputs. This set is useful to study when the actual command inputs or muscle forces are unknown, as is often the case in human movement. Movements made in response to postural perturbations were examined in light of the constraints acting upon this set. The constraints were found to greatly restrict the choices available to the central nervous system when forming a control. Sensitivity studies indicated that strengthening certain muscles can effect changes on the possible outputs. Finally, given the limited choices available, a model for central nervous system control showed that simple stability criteria are sufficient to approximate human behavior. Dissert. Abstr.

PROSTHETIC ELBOW JOINT Patent Application
Bruce Weddendorf, inventor (to NASA) 8 Jul. 1992 19 p
(NASA-Case-MFS-28707-1; NAS 1.71:MFS-28707-1; US-Patent-Appl-SN-912953) Avail: CASI HC A03/MF A01

An artificial manually positionable elbow joint for use in an upper extremity, above-elbow, prosthetic which provides a locking feature that is easily controlled by the wearer is described. The instant elbow joint is very strong and durable to withstand the repeated heavy loadings encountered by a wearer who works in an industrial, construction, farming or similar environment. The elbow joint of the present invention comprises a turntable, a frame, a forearm, and a locking assembly. The frame generally includes a housing for the locking assembly and two protruding ears. The forearm includes an elongated beam having a cup-shaped cylindrical member at one end and a locking wheel having a plurality of holes along a circular arc on its other end with a central bore for pivotal attachment to the protruding ears of the frame. The locking assembly includes a collar having a central opening with a plurality of internal grooves, a plurality of internal cam members each having a chamfered surface at one end and a V-shaped slot at its other end; an elongated locking pin having a crown wheel with cam surfaces and locking lugs secured thereto; two coiled compression springs; and a flexible filament attached to one end of the elongated locking pin and extending from the locking assembly for extending and retracting the locking pin into the holes in the locking wheel to permit selective adjustment of the forearm relative to the frame. In use, the turntable is affixed to the upper arm part of the prosthetic in the conventional manner and the cup-shaped cylindrical member on one end of the forearm is affixed to the forearm piece of the prosthetic in the conventional manner. The elbow joint is easily adjusted and locked between maximum flex and extended positions. NASA

THE EFFECTS OF SUPERIMPOSING SYMBOLOGY ON A SIMULATED NIGHT VISION GOGGLE DISPLAY Interim Report
D. M. McAnulty, John W. Ruffner, and David B. Hamilton Feb. 1993 84 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA903-92-D-0025)
(AD-A263458; ARI-RR-1636) Avail: CASI HC A05

The U.S. Army is acquiring a system that superimposes instrument symbology on night vision goggle (NVG) imagery. However, previous research indicates that the symbology may distract a pilot's attention from obstacle detection, recognition, and avoidance and may interfere with proper scanning patterns. To test the effects of combining imager and symbology, 36 helicopter pilots were presented night-flight scenarios simulating NVG imagery only, symbology only, and imagery plus symbology. The aviators were required to monitor and respond to predefined scene and symbology targets. They detected and responded rapidly to a high percentage of targets when viewing the scene-only and symbology-only scenarios. Their performance decreased significantly when the two types of information were presented together, but the decrease was small when compared to the increased amount of information available in the display. Aviator performance improved with practice and was related to experience and eye dominance. The aviators suggested several modifications for the symbology suite. DTIC

This document contains papers presented at the NAFIPS '92 North American Fuzzy Information Processing Society Conference. More than 75 papers were presented at this Conference, which was sponsored by NAFIPS in cooperation with NASA, the Instituto Tecnologico de Morelia, the Indian Society for Fuzzy Mathematics and Information Processing (ISFUMIP), the Instituto Tecnologico de Estudios Superiores de Monterrey (ITESM), the International Fuzzy Systems Association (IFSA), the Japan Society for Fuzzy Theory and Systems, and the Microelectronics and Computer Technology Corporation (MCC). The fuzzy set theory has led to a large number of diverse applications. Recently, interesting applications have been developed which involve the integration of fuzzy systems with adaptive processes such as neural networks and genetic algorithms. NAFIPS '92 was directed toward the advancement, commercialization, and engineering development of these technologies. For individual titles, see N93-29517 through N93-29555.

AN ANALYSIS OF POSSIBLE APPLICATIONS OF FUZZY SET THEORY TO THE ACTUARIAL CREDIBILITY THEORY **c67**
Krzysztof Ostaszewski and Waldemar Karwowski *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 1-6 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

In this work, we review the basic concepts of actuarial credibility theory from the point of view of introducing applications of the fuzzy set-theoretic method. We show how the concept of actuarial credibility can be modeled through the fuzzy set membership functions and how fuzzy set methods, especially fuzzy pattern recognition, can provide an alternative tool for estimating credibility. ESTIMATIONS OF EXPECTEDNESS AND POTENTIAL SURPRISE IN POSSIBILITY THEORY **c65**
Henri Prade and Ronald R. Yager (Iona Coll., New Rochelle, NY.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 7-13 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

This note investigates how various ideas of 'expectedness' can be captured in the framework of possibility theory. Particularly, we are interested in trying to introduce estimates of the kind of lack of surprise expressed by people when saying 'I would not be surprised that...' before an event takes place, or by saying 'I knew it' after its realization. In possibility theory, a possibility distribution is supposed to model the relative levels of mutually exclusive alternatives in a set, or equivalently, the alternatives are assumed to be rank-ordered according to their level of possibility to take place. Four basic set-functions associated with a possibility distribution, including standard possibility and necessity measures, are discussed from the point of view of what they estimate when applied to potential events. Extensions of these estimates based on the notions of Q-projection or OWA operators are proposed when only significant parts of the possibility distribution are retained in the evaluation. The case of partially-known possibility distributions is also considered. Some potential applications are outlined. Author (revised)

COMPARISON OF SPECIFICITY AND INFORMATION FOR FUZZY DOMAINS **c67**
Arthur Ramer *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 14-20 (For primary document see N93-29516 11-59)
Avail: CASI HC A01/MF A03

This paper demonstrates how an integrated theory can be built on the foundation of possibility theory. Information and uncertainty were considered in 'fuzzy' literature since 1982. Our departing point is the model proposed by Klir for the discrete case. It was elaborated axiomatically by Ramer, who also introduced the continuous model. Specificity as a numerical function was considered mostly within Dempster-Shafer evidence theory. An explicity definition was given first by Yager, who has also introduced it in the context of possibility theory. Axiomatic approach and the continuous model have been developed very recently by Ramer and Yager. They also establish a close analytical correspondence between specificity and information. In literature to date, specificity and uncertainty are defined only for the discrete finite domains, with a sole exception. Our presentation removes these limitations. We define specificity measures for arbitrary measurable domains. Author (revised)

HOW TO SELECT COMBINATION OPERATORS FOR FUZZY EXPERT SYSTEMS USING CRI **c67**
I. B. Turksen and Y. Tian *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 29-38 Sponsored in part by Natural Sciences and Engineering Research Council and Manufacturing Research Corp. (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

A method to select combination operators for fuzzy expert systems using the Compositional Rule of Inference (CRI) is proposed. First, fuzzy inference processes based on CRI are classified into three categories in terms of their inference results: the Expansion Type Inference, the Reduction Type Inference, and Other Type Inferences. Further, implication operators under Sup-T composition are classified as the Expansion Type Operator, the Reduction Type Operator, and the Other Type Operators. Finally, the combination of rules or their consequences is investigated for inference processes based on CRI. Author (revised)

APPROXIMATE REASONING USING TERMINOLOGICAL MODELS **c63**
John Yen and Nitin Vaidya (Texas A&M Univ., Houston.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 39-48 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

Term Subsumption Systems (TSS) form a knowledge-representation scheme in AI that can express the defining characteristics of concepts through a formal language that has a well-defined semantics and incorporates a reasoning mechanism that can deduce whether one concept subsumes another. However, TSS's have very limited ability to deal with the issue of uncertainty in knowledge bases. The objective of this research is to address issues in combining approximate reasoning with term subsumption systems. To do this, we have extended an existing AI architecture (CLASP) that is built on the top of a term subsumption system (LOOM). First, the assertional component of LOOM has been extended for asserting and representing uncertain propositions. Second, we have extended the pattern matcher of CLASP for plausible rule-based inferences. Third, an approximate reasoning model has been added to facilitate various kinds of approximate reasoning. And finally, the issue of inconsistency in truth values due to inheritance is addressed using justification of those values. This architecture enhances the reasoning capabilities of expert systems by providing support for reasoning under uncertainty using knowledge captured in TSS. Also, as definitional knowledge is explicit and separate from heuristic knowledge for plausible inferences, the maintainability of expert systems could be improved. Author (revised)

QUANTITATIVE ANALYSIS OF PROPERTIES AND SPATIAL RELATIONS OF FUZZY IMAGE REGIONS **c67**
Raghu Krishnapuram, James M. Keller, and Yibing Ma *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 49-58 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

Properties of objects and spatial relations between objects play an important role in rule-based approaches for high-level vision. The partial presence or absence of such properties and relationships can supply both positive and negative evidence for region labeling hypotheses. Similarly, fuzzy labeling of a region can generate new hypotheses pertaining to the properties of the region, its relation to the neighboring regions, and finally, the labels of the neighboring regions. In this paper, we present a unified methodology to characterize properties and spatial relationships of object regions in a digital image. The proposed methods can be used to arrive at more meaningful decisions about the contents of the scene. Author

A FUZZY CLUSTERING ALGORITHM TO DETECT PLANAR AND QUADRIC SHAPES **c61**

Raghu Krishnapuram, Hichem Frigui, and Olfa Nasraoui *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 59-68 (For primary document see N93-29516 11-59)

Avail: CASI HC A02/MF A03

In this paper, we introduce a new fuzzy clustering algorithm to detect an unknown number of planar and quadric shapes in noisy data. The proposed algorithm is computationally and implementationally simple, and it overcomes many of the drawbacks of the existing algorithms that have been proposed for similar tasks. Since the clustering is performed in the original image space, and since no features need to be computed, this approach is particularly suited for sparse data. The algorithm may also be used in pattern recognition applications. Author (revised)

A FUZZY MEASURE APPROACH TO MOTION FRAME ANALYSIS FOR SCENE DETECTION M.S. Thesis - Houston Univ. **c67**

Albert B. Leigh (McDonnell-Douglas Space Systems Co., Houston, TX.) and Sankar K. Pal (Indian Statistical Inst., Calcutta.) *In its* North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 69-80 (For primary document see N93-29516 11-59)

Avail: CASI HC A03/MF A03

This paper addresses a solution to the problem of scene estimation of motion video data in the fuzzy set theoretic framework. Using fuzzy image feature extractors, a new algorithm is developed to compute the change of information in each of two successive frames to classify scenes. This classification process of raw input visual data can be used to establish structure for correlation. The algorithm attempts to fulfill the need for nonlinear, frame-accurate access to video data for applications such as video editing and visual document archival/retrieval systems in multimedia environments. ENCODING SPATIAL IMAGES: A FUZZY SET THEORY APPROACH **c67**

Leszek M. Sztandera *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 89-97 (For primary document see N93-29516 11-59)

Avail: CASI HC A02/MF A03

As the use of fuzzy set theory continues to grow, there is an increased need for methodologies and formalisms to manipulate obtained fuzzy subsets. Concepts involving relative position of fuzzy patterns are acknowledged as being of high importance in many areas. In this paper, we present an approach based on the concept of dominance in fuzzy set theory for modelling relative positions among fuzzy subsets of a plane. In particular, we define the following spatial relations: to the left (right), in front of, behind, above, below, near, far from, and touching. This concept has been implemented to define spatial relationships among fuzzy subsets of the image plane. Spatial relationships based on fuzzy set theory, coupled with a fuzzy segmentation, should therefore yield realistic results in scene understanding. Author

IMAGE SEGMENTATION USING FUZZY LVQ CLUSTERING NETWORKS **c67**

Eric Chen-Kuo Tsao, James C. Bezdek, and Nikhil R. Pal *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 98-107 (For primary document see N93-29516 11-59)

(Grant NSF IRI-90-03252)

Avail: CASI HC A02/MF A03

In this note we formulate image segmentation as a clustering problem. Feature vectors extracted from a raw image are clustered into subregions, thereby segmenting the image. A fuzzy generalization of a Kohonen learning vector quantization (LVQ) which integrates the Fuzzy c-Means (FCM) model with the learning rate and updating strategies of the LVQ is used for this task. This network, which segments images in an unsupervised manner, is thus related to the FCM optimization problem. Numerical examples on photographic and magnetic resonance images are given to illustrate this approach to image segmentation. Author (revised)

A NEURO-FUZZY ARCHITECTURE FOR REAL-TIME APPLICATIONS **c67**

P. A. Ramamoorthy and Song Huang *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 108-117 (For primary document see N93-29516 11-59)

Avail: CASI HC A02/MF A03

Neural networks and fuzzy expert systems perform the same task of functional mapping using entirely different approaches. Each approach has certain unique features. The ability to learn specific input-output mappings from large input/output data possibly corrupted by noise and the ability to adapt or continue learning are some important features of neural networks. Fuzzy expert systems are known for their ability to deal with fuzzy information and incomplete/imprecise data in a structured, logical way. Since both of these techniques implement the same task (that of functional mapping--we regard 'inferencing' as one specific category under this class), a fusion of the two concepts that retains their unique features while overcoming their individual drawbacks will have excellent applications in the real world. In this paper, we arrive at a new architecture by fusing the two concepts. The architecture has the trainability/adaptibility (based on input/output observations) property of the neural networks and the architectural features that are unique to fuzzy expert systems. It also does not require specific information such as fuzzy rules, defuzzification procedure used, etc., though any such information can be integrated into the architecture. We show that this architecture can provide better performance than is possible from a single two or three layer feedforward neural network. Further, we show that this new architecture can be used as an efficient vehicle for hardware implementation of complex fuzzy expert systems for real-time applications. A numerical example is provided to show the potential of this approach. Author (revised)

A SELF-LEARNING RULE BASE FOR COMMAND FOLLOWING IN DYNAMICAL SYSTEMS c61

Wei K. Tsai, Hon-Mun Lee, and Alexander Parlos (Texas A&M Univ., College Station.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 125-134 (For primary document see N93-29516 11-59)
(Contract DE-FG07-89ER-12893)
Avail: CASI HC A02/MF A03

In this paper, a self-learning Rule Base for command following in dynamical systems is presented. The learning is accomplished though reinforcement learning using an associative memory called SAM. The main advantage of SAM is that it is a function approximator with explicit storage of training samples. A learning algorithm patterned after the dynamic programming is proposed. Two artificially created, unstable dynamical systems are used for testing, and the Rule Base was used to generate a feedback control to improve the command following ability of the otherwise uncontrolled systems. The numerical results are very encouraging. The controlled systems exhibit a more stable behavior and a better capability to follow reference commands. The rules resulting from the reinforcement learning are explicitly stored and they can be modified or augmented by human experts. Due to overlapping storage scheme of SAM, the stored rules are similar to fuzzy rules. Author (revised)

DESIGN ISSUES OF A REINFORCEMENT-BASED SELF-LEARNING FUZZY CONTROLLER FOR PETROCHEMICAL PROCESS CONTROL c67

John Yen, Haojin Wang, and Walter C. Daugherity *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 143-153 (For primary document see N93-29516 11-59)
Avail: CASI HC A03/MF A03

Fuzzy logic controllers have some often-cited advantages over conventional techniques such as PID control, including easier implementation, accommodation to natural language, and the ability to cover a wider range of operating conditions. One major obstacle that hinders the broader application of fuzzy logic controllers is the lack of a systematic way to develop and modify their rules; as a result the creation and modification of fuzzy rules often depends on trial and error or pure experimentation. One of the proposed approaches to address this issue is a self-learning fuzzy logic controller (SFLC) that uses reinforcement learning techniques to learn the desirability of states and to adjust the consequent part of its fuzzy control rules accordingly. Due to the different dynamics of the controlled processes, the performance of a self-learning fuzzy controller is highly contingent on its design. The design issue has not received sufficient attention. The issues related to the design of a SFLC for application to a petrochemical process are discussed, and its performance is compared with that of a PID and a self-tuning fuzzy logic controller. CLUSTERING OF TETHERED SATELLITE SYSTEM SIMULATION DATA BY AN ADAPTIVE NEURO-FUZZY ALGORITHM c67

Sunanda Mitra and Surya Pemmaraju *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 166-174 Sponsored in part by Northrop Corp. and Texas Advanced Technology Program (For primary document see N93-29516 11-59)
(Grant NAG9-509)
Avail: CASI HC A02/MF A03

Recent developments in neuro-fuzzy systems indicate that the concepts of adaptive pattern recognition, when used to identify appropriate control actions corresponding to clusters of patterns representing system states in dynamic nonlinear control systems, may result in innovative designs. A modular, unsupervised neural network architecture, in which fuzzy learning rules have been embedded is used for on-line identification of similar states. The architecture and control rules involved in Adaptive Fuzzy Leader Clustering (AFLC) allow this system to be incorporated in control systems for identification of system states corresponding to specific control actions. We have used this algorithm to cluster the simulation data of Tethered Satellite System (TSS) to estimate the range of delta voltages necessary to maintain the desired length rate of the tether. The AFLC algorithm is capable of on-line estimation of the appropriate control voltages from the corresponding length error and length rate error without a priori knowledge of their membership functions and familarity with the behavior of the Tethered Satellite System. DESIGNING A FUZZY SCHEDULER FOR HARD REAL-TIME SYSTEMS c67

John Yen, Jonathan Lee, Nathan Pfluger, and Swami Natarajan *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society

(NAFIPS 1992), Volume 1 Dec. 1992 p 185-194 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

In hard real-time systems, tasks have to be performed not only correctly, but also in a timely fashion. If timing constraints are not met, there might be severe consequences. Task scheduling is the most important problem in designing a hard real-time system, because the scheduling algorithm ensures that tasks meet their deadlines. However, the inherent nature of uncertainty in dynamic hard real-time systems increases the problems inherent in scheduling. In an effort to alleviate these problems, we have developed a fuzzy scheduler to facilitate searching for a feasible schedule. A set of fuzzy rules are proposed to guide the search. The situation we are trying to address is the performance of the system when no feasible solution can be found, and therefore, certain tasks will not be executed. We wish to limit the number of important tasks that are not scheduled. Author (revised)

WARP: WEIGHT ASSOCIATIVE RULE PROCESSOR. A DEDICATED VLSI FUZZY LOGIC MEGACELL **c67**
A. Pagni, R. Poluzzi, and G. G. Rizzotto *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 195-204 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

During the last five years Fuzzy Logic has gained enormous popularity in the academic and industrial worlds. The success of this new methodology has led the microelectronics industry to create a new class of machines, called Fuzzy Machines, to overcome the limitations of traditional computing systems when utilized as Fuzzy Systems. This paper gives an overview of the methods by which Fuzzy Logic data structures are represented in the machines (each with its own advantages and inefficiencies). Next, the paper introduces WARP (Weight Associative Rule Processor) which is a dedicated VLSI megacell allowing the realization of a fuzzy controller suitable for a wide range of applications. WARP represents an innovative approach to VLSI Fuzzy controllers by utilizing different types of data structures for characterizing the membership functions during the various stages of the Fuzzy processing. WARP dedicated architecture has been designed in order to achieve high performance by exploiting the computational advantages offered by the different data representations. Author (revised)

EVALUATION OF FUZZY INFERENCE SYSTEMS USING FUZZY LEAST SQUARES **c67**
Joseph M. Barone *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 205-214 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

Efforts to develop evaluation methods for fuzzy inference systems which are not based on crisp, quantitative data or processes (i.e., where the phenomenon the system is built to describe or control is inherently fuzzy) are just beginning. This paper suggests that the method of fuzzy least squares can be used to perform such evaluations. Regressing the desired outputs onto the inferred outputs can provide both global and local measures of success. The global measures have some value in an absolute sense, but they are particularly useful when competing solutions (e.g., different numbers of rules, different fuzzy input partitions) are being compared. The local measure described here can be used to identify specific areas of poor fit where special measures (e.g., the use of emphatic or suppressive rules) can be applied. Several examples are discussed which illustrate the applicability of the method as an evaluation tool. Author (revised)

DECISION ANALYSIS WITH APPROXIMATE PROBABILITIES **c81**
Thomas Whalen *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 229-238 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

This paper concerns decisions under uncertainty in which the probabilities of the states of nature are only approximately known. Decision problems involving three states of nature are studied. This is due to the fact that some key issues do not arise in two-state problems, while probability spaces with more than three states of nature are essentially impossible to graph. The primary focus is on two levels of probabilistic information. In one level, the three probabilities are separately rounded to the nearest tenth. This can lead to sets of rounded probabilities which add up to 0.9, 1.0, or 1.1. In the other level, probabilities are rounded to the nearest tenth in such a way that the rounded probabilities are forced to sum to 1.0. For comparison, six additional levels of probabilistic information, previously analyzed, were also included in the present analysis. A simulation experiment compared four criteria for decisionmaking using linearly constrained probabilities (Maximin, Midpoint, Standard Laplace, and Extended Laplace) under the eight different levels of information about probability. The Extended Laplace criterion, which uses a second order maximum entropy principle, performed best overall. Author (revised)

DISTRIBUTED TRAFFIC SIGNAL CONTROL USING FUZZY LOGIC **c67**
Stephen Chiu *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 239-247 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

We present a distributed approach to traffic signal control, where the signal timing parameters at a given intersection are adjusted as functions of the local traffic condition and of the signal timing parameters at adjacent intersections. Thus, the signal timing parameters evolve dynamically using only local information to improve traffic flow. This distributed approach provides for a fault-tolerant, highly responsive traffic management system. The signal timing at an intersection is defined by three parameters: cycle time, phase split, and offset. We use fuzzy decision rules to adjust these three parameters based only on local information. The amount of change in the timing parameters during each cycle is limited to a small fraction of the current parameters to ensure smooth transition. We show the effectiveness of this method through simulation of the traffic flow in a network of controlled intersections. Author

COMPARISON OF CRISP AND FUZZY CHARACTER NETWORKS IN HANDWRITTEN WORD RECOGNITION c63

Paul Gader, Magdi Mohamed, and Jung-Hsien Chiang *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 257-265 Sponsored in part by Environmental Research Inst. of Michigan and Postal Service (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

Experiments involving handwritten word recognition on words taken from images of handwritten address blocks from the United States Postal Service mailstream are described. The word recognition algorithm relies on the use of neural networks at the character level. The neural networks are trained using crisp and fuzzy desired outputs. The fuzzy outputs were defined using a fuzzy k-nearest neighbor algorithm. The crisp networks slightly outperformed the fuzzy networks at the character level but the fuzzy networks outperformed the crisp networks at the word level. Author (revised)

FUZZY NEURAL NETWORK METHODOLOGY APPLIED TO MEDICAL DIAGNOSIS c52

Marian B. Gorzalczany (Technical Univ. of Kielce, Poland.) and Mary Deutsch-McLeish *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 266-275 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

This paper presents a technique for building expert systems that combines the fuzzy-set approach with artificial neural network structures. This technique can effectively deal with two types of medical knowledge: a nonfuzzy one and a fuzzy one which usually contributes to the process of medical diagnosis. Nonfuzzy numerical data is obtained from medical tests. Fuzzy linguistic rules describing the diagnosis process are provided by a human expert. The proposed method has been successfully applied in veterinary medicine as a support system in the diagnosis of canine liver diseases. Author (revised)

AN EXPERIMENTAL METHODOLOGY FOR A FUZZY SET PREFERENCE MODEL c67

I. B. Turksen and Ian A. Willson *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 276-285 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

A flexible fuzzy set preference model first requires approximate methodologies for implementation. Fuzzy sets must be defined for each individual consumer using computer software, requiring a minimum of time and expertise on the part of the consumer. The amount of information needed in defining sets must also be established. The model itself must adapt fully to the subject's choice of attributes (vague or precise), attribute levels, and importance weights. The resulting individual-level model should be fully adapted to each consumer. The methodologies needed to develop this model will be equally useful in a new generation of intelligent systems which interact with ordinary consumers, controlling electronic devices through fuzzy expert systems or making recommendations based on a variety of inputs. The power of personal computers and their acceptance by consumers has yet to be fully utilized to create interactive knowledge systems that fully adapt their function to the user. Understanding individual consumer preferences is critical to the design of new products and the estimation of demand (market share) for existing products, which in turn is an input to management systems concerned with production and distribution. The question of what to make, for whom to make it and how much to make requires an understanding of the customer's preferences and the trade-offs that exist between alternatives. Conjoint analysis is a widely used methodology which de-composes an overall preference for an object into a combination of preferences for its constituent parts (attributes such as taste and price), which are combined using an appropriate combination function. Preferences are often expressed using linguistic terms which cannot be represented in conjoint models. Current models are also not implemented an individual level, making it difficult to reach meaningful conclusions about the cause of an individual's behavior from an aggregate model. The combination of complex aggregate models and vague linguistic preferences has greatly limited the usefulness and predictive validity of existing preference models. A fuzzy set preference model that uses linguistic variables and a fully interactive implementation should be able to simultaneously address these issues and substantially improve the accuracy of demand estimates. The parallel implementation of crisp and fuzzy conjoint models using identical data not only validates the fuzzy set model but also provides an opportunity to assess the impact of fuzzy set definitions and individual attribute choices implemented in the interactive methodology developed in this research. The generalized experimental tools needed for conjoint models can also be applied to many other types of intelligent systems. Author (revised)

A FUZZY SET PREFERENCE MODEL FOR MARKET SHARE ANALYSIS c67

I. B. Turksen and Ian A. Willson *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 286-295 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

Consumer preference models are widely used in new product design, marketing management, pricing, and market segmentation. The success of new products depends on accurate market share prediction and design decisions based on consumer preferences. The vague linguistic nature of consumer preferences and product attributes, combined with the substantial differences between individuals, creates a formidable challenge to marketing models. The most widely used methodology is conjoint analysis. Conjoint models, as currently implemented, represent linguistic preferences as ratio or interval-scaled numbers, use only numeric product attributes, and require aggregation of individuals for estimation purposes. It is not surprising that these models are costly to implement, are inflexible, and have a predictive validity that is not substantially better than chance. This affects the accuracy of market share estimates. A fuzzy set preference model can easily represent linguistic variables either in consumer preferences or product attributes with minimal measurement requirements (ordinal scales), while still estimating overall preferences suitable for market share prediction. This approach results in flexible individual-level conjoint models which can provide more accurate market share estimates from a smaller number of more meaningful consumer ratings. Fuzzy sets can be incorporated within existing preference model structures, such as a linear combination, using the techniques developed for conjoint analysis and market share estimation. The purpose of this article is to develop and fully test a fuzzy set preference model which can represent linguistic variables in individual-level models implemented in parallel with existing conjoint models. The potential improvements in market share prediction and predictive validity can substantially improve management decisions about what to make (product design), for whom to make it (market segmentation), and how much to make (market share prediction). INFORMATION COMPRESSION IN THE CONTEXT MODEL c82

Joerg Gebhardt, Rudolf Kruse, and Detlef Nauck *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 296-303 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

The Context Model provides a formal framework for the representation, interpretation, and analysis of vague and uncertain data. The clear semantics of the underlying concepts make it feasible to compare well-known approaches to the modeling of imperfect knowledge like that given in Bayes Theory, Shafer's Evidence Theory, the Transferable Belief Model, and Possibility Theory. In this paper we present the basic ideas of the Context Model and show its applicability as an alternative foundation of Possibility Theory and the epistemic view of fuzzy sets. Author (revised)

FUZZY KNOWLEDGE BASE CONSTRUCTION THROUGH BELIEF NETWORKS BASED ON LUKASIEWICZ LOGIC c67

Felipe Lara-Rosano *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 304-311 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

In this paper, a procedure is proposed to build a fuzzy knowledge base founded on fuzzy belief networks and Lukasiewicz logic. Fuzzy procedures are developed to do the following: to assess the belief values of a consequent, in terms of the belief values of its logical antecedents and the belief value of the corresponding logical function; and to update belief values when new evidence is available. INTELLIGENT FUZZY CONTROLLER FOR EVENT-DRIVEN REAL TIME SYSTEMS c67

Janos Grantner (Technical Univ. of Budapest, Hungary.), Marek Patyra (Minnesota Univ., Duluth.), and Marian S. Stachowicz (Minnesota Univ., Duluth.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 312-321 (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

Most of the known linguistic models are essentially static, that is, time is not a parameter in describing the behavior of the object's model. In this paper we show a model for synchronous finite state machines based on fuzzy logic. Such finite state machines can be used to build both event-driven, time-varying, rule-based systems and the control unit section of a fuzzy logic computer. The architecture of a pipelined intelligent fuzzy controller is presented, and the linguistic model is represented by an overall fuzzy relation stored in a single rule memory. A VLSI integrated circuit implementation of the fuzzy controller is suggested. At a clock rate of 30 MHz, the controller can perform 3 MFLIPS on multi-dimensional fuzzy data. Author (revised)

THE COGNITIVE BASES FOR THE DESIGN OF A NEW CLASS OF FUZZY LOGIC CONTROLLERS: THE CLEARNESS TRANSFORMATION FUZZY LOGIC CONTROLLER c67

Labib Sultan (York Univ., Toronto, Ontario.) and Talib Janabi *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 1 Dec. 1992 p 340-349 Sponsored in part by Natural Sciences and Engineering Research Council (For primary document see N93-29516 11-59)
Avail: CASI HC A02/MF A03

This paper analyses the internal operation of fuzzy logic controllers as referenced to the human cognitive tasks of control and decision making. Two goals are targeted. The first goal focuses on the cognitive interpretation of the mechanisms employed in the current design of fuzzy logic controllers. This analysis helps to create a ground to explore the potential of enhancing the functional intelligence of fuzzy controllers. The second goal is to outline the features of a new class of fuzzy controllers, the Clearness Transformation Fuzzy Logic Controller (CT-FLC), whereby some new concepts are advanced to qualify fuzzy controllers as 'cognitive devices' rather than 'expert system devices'. The operation of the CT-FLC, as a fuzzy pattern processing controller, is explored, simulated, and evaluated. Author (revised)

This document contains papers presented at the NAFIPS '92 North American Fuzzy Information Processing Society Conference. More than 75 papers were presented at this Conference, which was sponsored by NAFIPS in cooperation with NASA, the Instituto Tecnologico de Morelia, the Indian Society for Fuzzy Mathematics and Information Processing (ISFUMIP), the Instituto Tecnologico de Estudios Superiores de Monterrey (ITESM), the International Fuzzy Systems Association (IFSA), the Japan Society for Fuzzy Theory and Systems, and the Microelectronics and Computer Technology Corporation (MCC). The fuzzy set theory has led to a large number of diverse applications. Recently, interesting applications have been developed which involve the integration of fuzzy systems with adaptive processes such a neural networks and genetic algorithms. NAFIPS '92 was directed toward the advancement, commercialization, and engineering development of these technologies. For individual titles, see N93-29557 through N93-29585.

ADDING DYNAMIC RULES TO SELF-ORGANIZING FUZZY SYSTEMS c67

Catalin V. Buhusi *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 360-367 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

This paper develops a Dynamic Self-Organizing Fuzzy System (DSOFS) capable of adding, removing, and/or adapting the fuzzy rules and the fuzzy reference sets. The DSOFS background consists of a self-organizing neural structure with neuron relocation features which will develop a map of the input-output behavior. The relocation algorithm extends the topological ordering concept. Fuzzy rules (neurons) are dynamically added or released while the neural structure learns the pattern. The DSOFS advantages are the automatic synthesis and the possibility of parallel implementation. A high adaptation speed and a reduced number of neurons is needed in order to keep errors under some limits. The computer simulation results are presented in a nonlinear systems modelling application. Author

FUZZY LEARNING UNDER AND ABOUT AN UNFAMILIAR FUZZY TEACHER **c67**

Belur V. Dasarathy *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 368-377 (For primary document see N93-29556 11-59)

Avail: CASI HC A02/MF A03

This study addresses the problem of optimal parametric learning in unfamiliar fuzzy environments. Prior studies in the domain of unfamiliar environments, which employed either crisp or fuzzy approaches to model the uncertainty or imperfectness of the learning environment, assumed that the training sample labels provided by the unfamiliar teacher were crisp, even if not perfect. Here, the more realistic problem of fuzzy learning under an unfamiliar teacher who provides only fuzzy (instead of crisp) labels, is tackled by expanding the previously defined fuzzy membership concepts to include an additional component representative of the fuzziness of the teacher. The previously studied scenarios, namely, crisp and fuzzy learning under (crisp) unfamiliar teacher, can be looked upon as special cases of this new methodology. As under the earlier studies, the estimated membership functions can then be deployed during the ensuing classification decision phase to judiciously take into account the imperfectness of the learning environment. The study also offers some insight into the properties of several of these fuzzy membership function estimators by examining their behavior under certain specific scenarios. Author

SOME PROBLEMS WITH THE DESIGN OF SELF-LEARNING MANAGEMENT SYSTEMS **c67**

Ziny Flikop *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 378-387 (For primary document see N93-29556 11-59)

Avail: CASI HC A02/MF A03

In this paper some problems in the design of management systems for complex objects are discussed. Considering the absence of adequate models and the fact that human expertise in the management of non-stationary objects becomes obsolete quickly, the use of self-learning together with a two-step optimization of on-line control rules is suggested. To prepare for the object analysis, a set of definitions has been proposed. Traditional and fuzzy sets approaches are used in the analysis. To decrease the reaction time of the control system, we propose the development of control rules without feedback. Author

A NEURAL FUZZY CONTROLLER LEARNING BY FUZZY ERROR PROPAGATION **c67**

Detlef Nauck and Rudolf Kruse *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 388-397 (For primary document see N93-29556 11-59)

Avail: CASI HC A02/MF A03

In this paper, we describe a procedure to integrate techniques for the adaptation of membership functions in a linguistic variable based fuzzy control environment by using neural network learning principles. This is an extension to our work. We solve this problem by defining a fuzzy error that is propagated back through the architecture of our fuzzy controller. According to this fuzzy error and the strength of its antecedent each fuzzy rule determines its amount of error. Depending on the current state of the controlled system and the control action derived from the conclusion, each rule tunes the membership functions of its antecedent and its conclusion. By this we get an unsupervised learning technique that enables a fuzzy controller to adapt to a control task by knowing just about the global state and the fuzzy error. Author (revised)

DETERMINING RULES FOR CLOSING CUSTOMER SERVICE CENTERS: A PUBLIC UTILITY COMPANY'S FUZZY DECISION **c67**

Andre deKorvin (Houston Univ., TX.), Margaret F. Shipley (Houston Univ., TX.), and Robert N. Lea *In its* North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 398-407 (For primary document see N93-29556 11-59)

Avail: CASI HC A02/MF A03

In the present work, we consider the general problem of knowledge acquisition under uncertainty. Simply stated, the problem reduces to the following: how can we capture the knowledge of an expert when the expert is unable to clearly formulate how he or she arrives at a decision? A commonly used method is to learn by examples. We observe how the expert solves specific cases and from this infer some rules by which the decision may have been made. Unique to our work is the fuzzy set representation of the conditions or attributes upon which the expert may possibly base his fuzzy decision. From our examples, we infer certain and possible fuzzy rules for closing a customer service center and illustrate the importance of having the decision closely relate to the conditions under consideration. FUZZY SIMULATION IN CONCURRENT ENGINEERING **c67**

A. Kraslawski and L. Nystrom *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 408-417 (For primary document see N93-29556 11-59)

Avail: CASI HC A02/MF A03

Concurrent engineering is becoming a very important practice in manufacturing. A problem in concurrent engineering is the uncertainty associated with the values of the input variables and operating conditions. The problem discussed in this paper concerns the simulation of processes where the raw materials and the operational parameters possess fuzzy characteristics. The processing of fuzzy input information is performed by the vertex method and the commercial simulation packages POLYMATH and GEMS. The examples are presented to illustrate the usefulness of the method in the simulation of chemical engineering processes. Author (revised)

INVERSE PROBLEMS: FUZZY REPRESENTATION OF UNCERTAINTY GENERATES A REGULARIZATION **c67**

V. Kreinovich, Ching-Chuang Chang, L. Reznik (Footscray Inst. of Tech., Australia.), and G. N. Solopchenko (Saint Petersburg Technical Univ., Russia.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 418-426 Sponsored in part by Inst. for Manufacturing and Materials Management (For primary document see N93-29556 11-59)

(Grants NAG9-482; NSF CDA-90-15006)

Avail: CASI HC A02/MF A03

In many applied problems (geophysics, medicine, and astronomy) we cannot directly measure the values x(t) of the desired physical quantity x in different moments of time, so we measure some related quantity y(t), and then we try to reconstruct the desired values x(t). This problem is often ill-posed in the sense that two essentially different functions x(t) are consistent with the same measurement results. So, in order to get a reasonable reconstruction, we must have some additional prior information about the desired function x(t). Methods that use this information to choose x(t) from the set of all possible solutions are called regularization methods. In some cases, we know the statistical characteristics both of x(t) and of the measurement errors, so we can apply statistical filtering methods (well-developed since the invention of a Wiener filter). In some situations, we know the properties of the desired process, e.g., we know that the derivative of x(t) is limited by some number delta, etc. In this case, we can apply standard regularization techniques (e.g., Tikhonov's regularization). In many cases, however, we have only uncertain knowledge about the values of x(t), about the rate with which the values of x(t) can change, and about the measurement errors. In these cases, usually one of the existing regularization methods is applied. There exist several heuristics that choose such a method. The problem with these heuristics is that they often lead to choosing different methods, and these methods lead to different functions x(t). Therefore, the results x(t) of applying these heuristic methods are often unreliable. We show that if we use fuzzy logic to describe this uncertainty, then we automatically arrive at a unique regularization method, whose parameters are uniquely determined by the experts knowledge. Although we start with the fuzzy description, but the resulting regularization turns out to be quite crisp. Author (revised)

QUANTIFICATION OF HUMAN RESPONSES **c53**

R. C. Steinlage, T. E. Gantner, and P. Y. W. Lim (Boise Cascade Corp., Portland, OR.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 427-436 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

Human perception is a complex phenomenon which is difficult to quantify with instruments. For this reason, large panels of people are often used to elicit and aggregate subjective judgments. Print quality, taste, smell, sound quality of a stereo system, softness, and grading Olympic divers and skaters are some examples of situations where subjective measurements or judgments are paramount. We usually express what is in our mind through language as a medium but languages are limited in available choices of vocabularies, and as a result, our verbalizations are only approximate expressions of what we really have in mind. For lack of better methods to quantify subjective judgments, it is customary to set up a numerical scale such as 1, 2, 3, 4, 5 or 1, 2, 3, ..., 9, 10 for characterizing human responses and subjective judgments with no valid justification except that these scales are easy to understand and convenient to use. But these numerical scales are arbitrary simplifications of the complex human mind; the human mind is not restricted to such simple numerical variations. In fact, human responses and subjective judgments are psychophysical phenomena that are fuzzy entities and therefore difficult to handle by conventional mathematics and probability theory. The fuzzy mathematical approach provides a more realistic insight into understanding and quantifying human responses. This paper presents a method for quantifying human responses and subjective judgments without assuming a pattern of linear or numerical variation for human responses. In particular, quantification and evaluation of linguistic judgments was investigated. Author (revised)

NON-SCALAR UNCERTAINTY: UNCERTAINTY IN DYNAMIC SYSTEMS **c65**

Salvador Gutierrez Martinez *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 437-448 (For primary document see N93-29556 11-59)
Avail: CASI HC A03/MF A03

The following point is stated throughout the paper: dynamic systems are usually subject to uncertainty, be it the unavoidable quantic uncertainty when working with sufficiently small scales or when working in large scales uncertainty can be allowed by the researcher in order to simplify the problem, or it can be introduced by nonlinear interactions. Even though non-quantic uncertainty can generally be dealt with by using the ordinary probability formalisms, it can also be studied with the proposed non-scalar formalism. Thus, non-scalar uncertainty is a more general theoretical framework giving insight into the nature of uncertainty and providing a practical tool in those cases in which scalar uncertainty is not enough, such as when studying highly nonlinear dynamic systems. This paper's specific contribution is the general concept of non-scalar uncertainty and a first proposal for a methodology. Applications should be based upon this methodology. The advantage of this approach is to provide simpler mathematical models for prediction of the system states. Present conventional tools for dealing with uncertainty prove insufficient for an effective description of some dynamic systems. The main limitations are overcome abandoning ordinary scalar algebra in the real interval (0, 1) in favor of a tensor field with a much richer structure and generality. This approach gives insight into the interpretation of Quantum Mechanics and will have its most profound consequences in the fields of elementary particle physics and nonlinear dynamic systems. Concepts like 'interfering alternatives' and 'discrete states' have an elegant explanation in this framework in terms of properties of dynamic systems such as strange attractors and chaos. The tensor formalism proves especially useful to describe the mechanics of representing dynamic systems with models that are closer to reality and have relatively much simpler solutions. It was found to be wise to get an approximate solution to an accurate model than to get a precise solution to a model constrained by simplifying assumptions. Precision has a very heavy cost in present physical models, but this formalism allows the trade between uncertainty and simplicity. It was found that modeling reality sometimes requires that state transition probabilities should be manipulated as nonscalar quantities, finding at the end that there is always a transformation to get back to scalar probability. COMPARISON BETWEEN THE PERFORMANCE OF TWO CLASSES OF FUZZY CONTROLLERS **c67**

T. H. Janabi and L. H. Sultan (York Univ., Toronto, Ontario.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 449-457 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

This paper presents an application comparison between two classes of fuzzy controllers: the Clearness Transformation Fuzzy Controller (CTFC) and the CRI-based Fuzzy Controller. The comparison is performed by studying the application of the controllers to simulation examples of nonlinear systems. The CTFC is a new approach for the organization of fuzzy controllers based on a cognitive model of parameter driven control, the notion of fuzzy patterns to represent fuzzy knowledge and the Clearness Transformation Rule of Inference (CTRI) for approximate reasoning. The approach facilitates the implementation of the basic modules of the controller: the fuzzifier, defuzzifier, and the control protocol in a rule-based architecture. The CTRI scheme for approximate reasoning does not require the formation of fuzzy relation matrices yielding improved performance in comparison with the traditional organization of fuzzy controllers. ON THE EVALUATION OF FUZZY QUANTIFIED QUERIES IN A DATABASE MANAGEMENT SYSTEM **c82**

Patrick Bosc and Olivier Pivert *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec.

1992 p 478-487 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

Many propositions to extend database management systems have been made in the last decade. Some of them aim at the support of a wider range of queries involving fuzzy predicates. Unfortunately, these queries are somewhat complex and the question of their efficiency is a subject under discussion. In this paper, we focus on a particular subset of queries, namely those using fuzzy quantified predicates. More precisely, we will consider the case where such predicates apply to individual elements as well as to sets of elements. Thanks to some interesting properties of alpha-cuts of fuzzy sets, we are able to show that the evaluation of these queries can be significantly improved with respect to a naive strategy based on exhaustive scans of sets or files. A FUZZY CASE BASED REASONING TOOL FOR MODEL BASED APPROACH TO ROCKET ENGINE HEALTH MONITORING c20

Srinivas Krovvidy, Adam Nolan, Yong-Lin Hu, and William G. Wee *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 488-495 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

In this system we develop a fuzzy case based reasoner that can build a case representation for several past anomalies detected, and we develop case retrieval methods that can be used to index a relevant case when a new problem (case) is presented using fuzzy sets. The choice of fuzzy sets is justified by the uncertain data. The new problem can be solved using knowledge of the model along with the old cases. This system can then be used to generalize the knowledge from previous cases and use this generalization to refine the existing model definition. This in turn can help to detect failures using the model based algorithms. Author (revised)

A HIGH PERFORMANCE, AD-HOC, FUZZY QUERY PROCESSING SYSTEM FOR RELATIONAL DATABASES c82

William H. Mansfield, Jr. and Robert M. Fleischman *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 496-505 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

Database queries involving imprecise or fuzzy predicates are currently an evolving area of academic and industrial research. Such queries place severe stress on the indexing and I/O subsystems of conventional database environments since they involve the search of large numbers of records. The Datacycle architecture and research prototype is a database environment that uses filtering technology to perform an efficient, exhaustive search of an entire database. It has recently been modified to include fuzzy predicates in its query processing. The approach obviates the need for complex index structures, provides unlimited query throughput, permits the use of ad-hoc fuzzy membership functions, and provides a deterministic response time largely independent of query complexity and load. This paper describes the Datacycle prototype implementation of fuzzy queries and some recent performance results. Author (revised)

GENETIC ALGORITHMS IN ADAPTIVE FUZZY CONTROL c67

C. Lucas Karr and Tony R. Harper *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 506-514 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

Researchers at the U.S. Bureau of Mines have developed adaptive process control systems in which genetic algorithms (GA's) are used to augment fuzzy logic controllers (FLC's). GA's are search algorithms that rapidly locate near-optimum solutions to a wide spectrum of problems by modeling the search procedures of natural genetics. FLC's are rule based systems that efficiently manipulate a problem environment by modeling the 'rule-of-thumb' strategy used in human decision making. Together, GA's and FLC's possess the capabilities necessary to produce powerful, efficient, and robust adaptive control systems. To perform efficiently, such control systems require a control element to manipulate the problem environment, an analysis element to recognize changes in the problem environment, and a learning element to adjust fuzzy membership functions in response to the changes in the problem environment. Details of an overall adaptive control system are discussed. A specific computer-simulated chemical system is used to demonstrate the ideas presented. Author (revised)

A GENETIC ALGORITHMS APPROACH FOR ALTERING THE MEMBERSHIP FUNCTIONS IN FUZZY LOGIC CONTROLLERS c67

Hana Shehadeh (LinCom Corp., Houston, TX.) and Robert N. Lea *In its* North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 515-523 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

Through previous work, a fuzzy control system was developed to perform translational and rotational control of a space vehicle. This problem was then re-examined to determine the effectiveness of genetic algorithms on fine tuning the controller. This paper explains the problems associated with the design of this fuzzy controller and offers a technique for tuning fuzzy logic controllers. A fuzzy logic controller is a rule-based system that uses fuzzy linguistic variables to model human rule-of-thumb approaches to control actions within a given system. This 'fuzzy expert system' features rules that direct the decision process and membership functions that convert the linguistic variables into the precise numeric values used for system control. Defining the fuzzy membership functions is the most time consuming aspect of the controller design. One single change in the membership functions could significantly alter the performance of the controller. This membership function definition can be accomplished by using a trial and error technique to alter the membership functions creating a highly tuned controller. This approach can be time consuming and requires a great deal of knowledge from human experts. In order to shorten development time, an iterative procedure for altering the membership functions to create a tuned set that used a minimal amount of fuel for velocity vector approach and station-keep maneuvers was developed. Genetic algorithms, search techniques used for optimization, were utilized to solve this problem. Author (revised)

FUZZY MULTIPLE LINEAR REGRESSION: A COMPUTATIONAL APPROACH c67

C. H. Juang, X. H. Huang, and J. W. Fleming *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 524-534 (For primary document see N93-29556 11-59)
(Grant NSF MSS-90-20252)
Avail: CASI HC A03/MF A03

This paper presents a new computational approach for performing fuzzy regression. In contrast to Bardossy's approach, the new approach, while dealing with fuzzy variables, closely follows the conventional regression technique. In this approach, treatment of fuzzy input is more 'computational' than 'symbolic.' The following sections first outline the formulation of the new approach, then deal with the implementation and computational scheme, and this is followed by examples to illustrate the new procedure. INCORPORATION OF VARYING TYPES OF TEMPORAL DATA IN A NEURAL NETWORK c63

M. E. Cohen and D. L. Hudson (California Univ., San Francisco.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 535-544 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

Most neural network models do not specifically deal with temporal data. Handling of these variables is complicated by the different uses to which temporal data are put, depending on the application. Even within the same application, temporal variables are often used in a number of different ways. In this paper, types of temporal data are discussed, along with their implications for approximate reasoning. Methods for integrating approximate temporal reasoning into existing neural network structures are presented. These methods are illustrated in a medical application for diagnosis of graft-versus-host disease which requires the use of several types of temporal data. Author (revised)

Formal neuronal networks (FNN), which are comprised of threshold gates, make use of the unit step function. It is regarded as a degenerated distribution function (DDF) and will be referred to here as a non-fuzzy threshold operator (nFTO). Special networks of this kind generating long cycles of states are modified by introduction of fuzzy threshold operators (FTO), i.e., non-degenerated distribution functions (nDDF). The cyclic behavior of the new nets is compared with the original ones. The interconnection matrix and threshold values are not modified. It is concluded that the original long cycles change the fixed points and short cycles, and as the computer simulations demonstrate, the aperiodic motion that is associated with chaotic behavior appears. The emergence of the above changes depend on the steepness of the threshold operators. Author (revised)

In this paper, the implementation of a fuzzy data processing system using an artificial neural network (ANN) is discussed. The binary representation of fuzzy data is assumed, where the universe of discourse is decartelized into n equal intervals. The value of a membership function is represented by a binary number. It is proposed that incomplete fuzzy data processing be performed in two stages. The first stage performs the 'retrieval' of incomplete fuzzy data, and the second stage performs the desired operation on the retrieval data. The method of incomplete fuzzy data retrieval is proposed based on the linear approximation of missing values of the membership function. The ANN implementation of the proposed system is presented. The system was computationally verified and showed a relatively small total error. Author (revised)

HIERARCHICAL MODEL OF MATCHING **c67**
Witold Pedrycz and Eugene Roventa (York Univ., Toronto, Ontario.) *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 581-588 Sponsored in part by Natural Sciences and Engineering Research Council and MicroNet (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

The issue of matching two fuzzy sets becomes an essential design aspect of many algorithms including fuzzy controllers, pattern classifiers, knowledge-based systems, etc. This paper introduces a new model of matching. Its principal features involve the following: (1) matching carried out with respect to the grades of membership of fuzzy sets as well as some functionals defined on them (like energy, entropy,transom); (2) concepts of hierarchies in the matching model leading to a straightforward distinction between 'local' and 'global' levels of matching; and (3) a distributed character of the model realized as a logic-based neural network. Avail: CASI HC A02/MF A03

This paper addresses the issue of applying a globally convergent optimization algorithm to the training of multilayer perceptrons, a class of Artificial Neural Networks. The multilayer perceptrons are trained towards the solution of two highly nonlinear problems: (1) signal detection in a multi-user communication network, and (2) solving the inverse kinematics for a robotic manipulator. The research is motivated by the fact that a multilayer perceptron is theoretically capable of approximating any nonlinear function to within a specified accuracy. The algorithm that has been employed in this study combines the merits of two well known optimization algorithms, the Conjugate Gradients and the Trust Regions Algorithms. The performance is compared to a widely used algorithm, the Backpropagation Algorithm, that is basically a gradient-based algorithm, and hence, slow in converging. The performances of the two algorithms are compared with the convergence rate. Furthermore, in the case of the signal detection problem, performances are also benchmarked by the decision boundaries drawn as well as the probability of error obtained in either case. Avail: CASI HC A02/MF A03

Inference based on fuzzy 'If ... then' rules has played a very important role since when Zadeh proposed the Compositional Rule of Inference and, especially, since the first successful application presented by Mamdani. From the mid-1980's when the 'fuzzy boom' started in Japan, numerous industrial applications appeared, all using simplified techniques because of the high levels of computational complexity. Another feature is that antecedents in the rules are distributed densely in the input space, so the conclusion can be calculated by some weighted combination of the consequents of the matching (fired) rules. The CRI works in the following way: If R is a rule and A* is an observation, the conclusion is computed by B* = R o A* (o stands for the max-min composition). Algorithms implementing this idea directly have an exponential time complexity (maybe the problem is NP-hard) as the rules are relations in X x Y, a k1 x k2 dimensional space, if X is k1, Y is k2 dimensional. The simplified techniques usually decompose the relation into k1 projections in X(sub i) and measure in some way the degree of similarity between observation and antecedent by some parameter of the overlapping. These parameters are aggregated to a single value in (0,1) which is applied as a resulting weight for the given rule. The projections of rules in dimensions Y(sub i) are weighted by these aggregated values and then they are combined in order to obtain a resulting conclusion separately in every dimension. This method is unapplicable with sparse bases as there is no guarantee that an arbitrary observation matches with any of the antecedents. Then, the degree of similarity is 0 and all consequents are weighted by 0. Some considerations for such a situation are summarized in the next sections. Author (revised)

Avail: CASI HC A02/MF A03

In rare situations, like fundamental physics, we perform experiments without knowing what their results will be. In the majority of real-life measurement situations, we more or less know beforehand what kind of results we will get. Of course, this is not the precise knowledge of the type 'the result will be between alpha - beta and alpha + beta,' because in this case, we would not need any measurements at all. This is usually a knowledge that is best represented in uncertain terms, like 'perhaps (or 'most likely', etc.) the measured value x is between alpha - beta and alpha + beta.' Traditional statistical methods neglect this additional knowledge and process only the measurement results. So it is desirable to be able to process this uncertain knowledge as well. A natural way to process it is by using fuzzy logic. But, there is a problem; we can use different membership functions to represent the same uncertain statements, and different functions lead to different results. What membership function do we choose? In the present paper, we show that under some reasonable assumptions, Gaussian functions mu(x) = exp(-beta(x(exp 2))) are the most adequate choice of the membership functions for representing uncertainty in measurements. This representation was efficiently used in testing jet engines to airplanes and spaceships. Author (revised)

LIFE INSURANCE RISK ASSESSMENT USING A FUZZY LOGIC EXPERT SYSTEM **c65**
Luis A. Carreno and Roy A. Steel *In* NASA. Johnson Space Center, North American Fuzzy Logic Processing Society (NAFIPS 1992), Volume 2 Dec. 1992 p 627-635 (For primary document see N93-29556 11-59)
Avail: CASI HC A02/MF A03

In this paper, we present a knowledge based system that combines fuzzy processing with rule-based processing to form an improved decision aid for evaluating risk for life insurance. This application illustrates the use of FuzzyCLIPS to build a knowledge based decision support system possessing fuzzy components to improve user interactions and KBS performance. The results employing FuzzyCLIPS are compared with the results obtained from the solution of the problem using traditional numerical equations. The design of the fuzzy solution consists of a CLIPS rule-based system for some factors combined with fuzzy logic rules for others. This paper describes the problem, proposes a solution, presents the results, and provides a sample output of the software product. Author

We have built and tested a Single Event Upset (SEU) tolerant computer (STC) based on the MIPS R3000 processor. Testing in a proton environment is ongoing. The design of this computer was postulated in previous work and based upon extensive radiation effects testing performed by Lawrence Livermore National Laboratory (LLNL). This computer is based entirely on commercially available parts. The purpose of these tests is to demonstrate the capability of using non-radiation hardened parts in an SEU environment, in this case Low Earth Orbit (LEO), with upset mitigation through fault tolerant hardware and software design methodologies. The hardware and software designs are described in detail, the test setup and test parameters are given, and test results are presented. DOE

A motionless head 2-D parallel readout system for optical disks is presented. Its unique features are discussed and it is compared to various parallel access optical storage media. The motionless-head parallel read-out system for optical disks is shown to meet current and near-term future requirements for high performance secondary storage. In order to select a memory architecture compatible with the motionless-head disk, inner-product and outer-product associative memory algorithms are compared in terms of their storage requirements, search times, system complexities, and fault tolerance. Based on this comparison, the page serial, bit-parallel inner-product method is shown to be well suited to implementation with parallel readout optical disk, and opto-electronic XNOR gate arrays, using for instance the Si/PLZT technology. Finally, the associative memory system design is presented. DTIC

This is a real-time robotic controller and simulator which is a MIMD-SIMD parallel architecture for interfacing with an external host computer and providing a high degree of parallelism in computations for robotic control and simulation. It includes a host processor for receiving instructions from the external host computer and for transmitting answers to the external host computer. There are a plurality of SIMD microprocessors, each SIMD processor being a SIMD parallel processor capable of exploiting fine grain parallelism and further being able to operate asynchronously to form a MIMD architecture. Each SIMD processor comprises a SIMD architecture capable of performing two matrix-vector operations in parallel while fully exploiting parallelism in each operation. There is a system bus connecting the host processor to the plurality of SIMD microprocessors and a common clock providing a continuous sequence of clock pulses. There is also a ring structure interconnecting the plurality of SIMD microprocessors and connected to the clock for providing the clock pulses to the SIMD microprocessors and for providing a path for the flow of data and instructions between the SIMD microprocessors. The host processor includes logic for controlling the RRCS by interpreting instructions sent by the external host computer, decomposing the instructions into a series of computations to be performed by the SIMD microprocessors, using the system bus to distribute associated data among the SIMD microprocessors, and initiating activity of the SIMD microprocessors to perform the computations on the data by procedure call.

A system capable of showing three dimensional images of flying objects is described. The objects are moved by flight data coming from several possible sources, that is, a (real time) simulation or telemetry. The system is implemented on a personal computer and a transputer network. The transputer network is capable of showing the movement in real time, that is, there are enough images per second to have a smooth movement. The basic concepts of three dimensional images are defined, the mathematical background is prepared, and both implementations are described. ESA

Investigations of techniques for describing and enhancing the accuracy of optical linear algebra processors have been conducted. Significant accomplishments include: (1) development and simulation of a system model incorporating device dynamic range for better quantitative assessment of error-correction code performance; (2) extension of earlier statistical models to include crosstalk, background, avalanche gain, flicker and generation-recombination noise effects; (3) construction of the Optical Analysis Simulation Interactive System (OASIS) software for the acquisition, analysis and manipulation of experimental data; and (4) identification of major noise sources of experimental concern using OASIS. PROMOTING HIGH-PERFORMANCE COMPUTING AND COMMUNICATIONS
Jun. 1993 78 p
(ISBN-0-16-041828-3) Avail: CASI HC A05/MF A01

The High Performance Computing and Communications (HPCC) program embodies many concerns regarding federal technology policy: the role of the federal government in promoting new industries, building infrastructure, supporting joint federal-private efforts, and encouraging the transfer of technology. This report focuses on the first of these concerns--the federal role in promoting new industries. As requested by the Senate Committee on Commerce, Science, and Transportation, the report concentrates on the obstacles--mainly on the demand side--that might prevent the high-performance computing and data communications industries from growing and using the technology being developed under the HPCC program. In keeping with the Congressional Budget Office's (CBO's) mandate to provide nonpartisan analysis, no recommendations are made. Derived from text

MINIMUM SECURITY REQUIREMENTS FOR MULTI-USER OPERATING SYSTEMS
Mar. 1993 50 p
(PB93-185999; NISTIR-5153) Avail: CASI HC A03/MF A01

The Minimum Security Requirements for Multi-User Operating Systems (MSR) document provides basic commercial computer system security requirements applicable to both government and commercial organizations. These requirements include technical measures that can be incorporated into multi-user, remote-access, resource-sharing, and information-sharing computer systems. The MSR document was written from the prospective of protecting the confidentiality and integrity of an organization's resources and promoting the continual availability of these resources. The MSR presented in the document form the basis for the commercially oriented protection profiles in Volume 2 of the draft Federal Criteria for Information Technology Security document. The MSR document has been developed by the MSR Working Group of the Federal Criteria Project under National Institute of Standards and Technology (NIST) leadership with a high level of private sector participation. Its contents are based on the Trusted Computer System Evaluation Criteria (TCSEC) C2 criteria class, with additions from current computer industry practice and commercial security requirements specifications. TRANSPUTERS, PARALLEL PROCESSING IN EMBEDDED SYSTEMS FOR IMAGE COMPRESSION IN SPACE APPLICATIONS [TRANSPUTERS, PARALLEL REKENEN IN EMBEDDED SYSTEMEN TEN BEHOEVE VAN BEELDCOMPRESIE VOOR RUIMTEVAARTTOEPASSINGEN]
M. H. J. B. Versteeg 28 Jun. 1989 14 p In DUTCH Presented at Massief Rekenen, The Hague, Netherlands, 7 Jun. 1989
(NLR-TP-89242-U; ETN-93-93317) Avail: CASI HC A03/MF A01

A system was developed for ESOC (European Space Operations Center) in the framework of the METEODIS (Meteosat Dissemination) to demonstrate the use of data compression and encryption within the operational Meteosat dissemination system. The compression function was used to increase the amount of meteorological data (images) that can be disseminated to the users. Programmable units were used to perform the compression and decompression functions within the METEODIS system. A powerful multiprocessor system is required to perform these functions fast enough. In the METEODIS project the compression and decompression functions are realized with four transputers each. The transputer is a single chip microprocessor with a RISC (Reduced Instruction Set Computer) architecture specially suited for use in multiprocessor systems. ESA

CONCURRENT CLEAN LANGUAGE MANUAL, VERSION 0.8

Marko vanEekelen, Halbe Huitema, Eric Necker, Sjaak Smetsers, and Rinus Plasmeijer Aug. 1992 98 p
(TR-92-18; ETN-93-93872) Avail: CASI HC A05/MF A02

Concurrent Clean is an experimental purely lazy functional language suited for evaluation in different kinds of machine architectures varying from simple computers to highly parallel architectures. Concurrent Clean is introduced by a demonstration of how some functional programs are written down in this formalism. The basic semantics of Current Clean, the type system, the modules (exporting, importing, etc.), input/output handling, and annotations, are described. The description of Current Clean given corresponds to the Concurrent Clean System version 0.8. Changes and additions to the previous release (0.7) are documented. ESA

COARSE IMAGE MOTION FOR SACCADE CONTROL

Philip F. Mclauchlan and David W. Murray Oct. 1991 17 p
(OUEL-1916/92; ETN-93-93874) Avail: CASI HC A03/MF A01

A two dimensional vision module that estimates the translational motion of moving objects for the purpose of driving saccadic camera motions to fixate them is described. Robustness and a fast reaction time are the main requirements of the module. The algorithm is designed for use with a head whose movements can be described to a first approximation as pure rotation. The apparently moving background is segmented from the moving objects on the scene using a prediction of the background flow obtained from head odometry. Subsequently the detected objects are analyzed to determine their velocity using a simple least square method to solve the aperture problem. The potential of the algorithm for parallelism and pipelining is described. ESA

RECOGNIZING PARAMETERIZED OBJECTS FROM RANGE DATA

Ian David Reid 1991 129 p Sponsored by Rhodes Trust, and Sasakawa Fund
(OUEL-1918/92; ETN-93-93875) Avail: CASI HC A07/MF A02

Techniques for recognizing instances of 3D (three dimensional) object classes from sets of 3D feature observations are developed, motivated by the problem of pallet acquisition for a mobile vehicle equipped with a laser triangulation range finder. Recognition is structured as a depth first search of an interpretation tree. The combinatorial explosion of the number of interpretations is controlled by constraints on geometric measurements between pairs of sensed features, which are also used to determine upper and lower bounds on the model parameter values of the instance. A real valued constraint propagation network unifies the representations of the model parameters, model constraints and feature constraints, and provides a simple and effective mechanism for accessing and updating parameter values. Recognition of objects with multiple internal degrees of freedom, including non-uniform scaling and stretching, articulations, and subpart repetitions, is demonstrated for two different types of real range data: 3D fragments from a stereo vision system, and position/surface normal data derived from planar patches extracted from a range image. Although there is an increase in the computation required relative to fixed models, the added flexibility of the system is shown to more than compensate. Range data is obtained using a laser stripe triangulation range sensor, fitted to a mobile vehicle. The design of the range finder is discussed and an effective, accurate calibration procedure derived. Simple features are extracted from range images delivered by the sensor and used to compute the geometric measurements for recognition, providing a high level of robustness to occlusion. ESA

FORMAL DEFINITION OF A CONCEPTUAL LANGUAGE FOR THE DESCRIPTION AND MANIPULATION OF INFORMATION MODELS

A. H. M. terHofstede (Utrecht State Univ., Netherlands.), H. A. Proper, and T. P. danderWeide Jul. 1992 58 p Sponsored in part by Software Engineering Research Center, Netherlands, and Netherlands Organization for Scientific Research
(TR-92-16; ETN-93-93870) Avail: CASI HC A04/MF A01

The redesign of strongly extended version of RIDL (Reference and IDea Language) is addressed. RIDL was developed for manipulating and querying an information structure. The resulting language is called LISA-D (Language for Information Structure and Access Descriptions), and is based on PSM (Predictor Set Modeling). An informal introduction to PSM and LISA-D is given and a summary of the formal definition of PSM is given. Path expressions, which form a primitive, yet powerful language for information manipulation, are introduced. The language LISA-D is introduced and formally defined by means of a translation to path expressions. Information descriptors form the basic syntactical construct of LISA-D, and they are used for the definition of constraints, queries and updates in LISA-D. ESA

DYNAMIC OBJECT ORIENTED INTERACTION AND ITS IMPLEMENTATION IN THE FRAMEWORK IN AN INTERFACE MANAGEMENT SYSTEM Ph.D. Thesis [DYNAMISCHE OBJEKTORIENTIERTE INTERAKTION UND IHRE IMPLEMENTIERUNG IM RAHMEN EINES SCHNITTSTELLENVERWALTUNGSSYSTEMS]

Hinrich Bruening 1990 109 p In GERMAN
(ETN-93-93795) Avail: CASI HC A06/MF A02

The final goal of the DIADES (Design tool for Interactive programs with provisions to Assess DESign decisions) project is the development of an integrated tool for the design, assessment, and generation of user interfaces. The communication of this tool with the user in different machines and operating systems shall be done through a uniform graphic interface. The interface shall realize an object oriented management of visualized communication parts with a mostly automatic dynamic control of the coherence in planning and timing. Requirements for such an interface are discussed. A balance between ideally desirable and realistically gainable capabilities must be found. An interface module is developed, which should demonstrate some new functionalities: automatic horizontal scrolling of text, to present longer text in small parts of the screen; the presentation and control of picture sequences as another kind of animation of graphic representations; automatic distribution of parts of the representation inside the limit resource of screen space, including the space sharing of specific parts; arranging representable parts in a time axis to make them appear at a specific moment for a specified time interval (including the possible rearrangement of other parts of the representation); and some means for the user to change the order (and logical grouping) of represented parts of the picture. The virtual interaction device, together with a (conventional) window manager, will adapt all input and output to a standard graphic interface. Different graphic interface systems with the requirements of the interaction device are considered and one is selected for the implementation. The reason for selecting X-Windows and the implementation of the virtual interaction device are described. ESA

STUDY ON THE CONCURRENT CALCULATION WITH A MULTITRANSPUTER NETWORK
Shinji Inomata and Katsuo Suzuki Jun. 1992 86 p
(DE93-753191; JAERI-M-92-084) Avail: CASI HC A05/MF A01

A relation between the calculation processing time and the overhead of multitransputer network is studied in performing several concurrent calculations. The hardware configuration we used was a ring-type linked nine transputer network on an INMOS B008 mother board which was inserted into a slot of a personal computer compatible with IBM PC/AT. Further, we used the occam2 toolset of MS-DOS version to write the calculation programs in the occam2 language. On arithmetic operations, some trigonometric, and transcendental functions and numerical integrations, the calculation time and overhead were measured. The results show that the relative calculation speed is proportional to the number of transputers when the ratio of calculation time to overhead is much greater than 1.0. The overhead is consumed in intercommunicating among transputers for the parallel calculation set-up. DOE

DIRECT VOLUME VISUALIZATION OF THREE-DIMENSIONAL VECTOR FIELDS
R. A. Crawfis and N. L. Max Apr. 1992 12 p Presented at the Visualization 1992, Boston, MA, 19-23 Oct. 1992
(Contract W-7405-eng-48)
(DE93-009233; UCRL-JC-109885; CONF-921079-4) Avail: CASI HC A03/MF A01

Current techniques for direct volume visualization offer only the ability to examine scalar fields. However, most scientific explorations require the examination of vector and possibly tensor fields as well as numerous scalar fields. An algorithm to directly render three-dimensional scalar and vector fields is described. The algorithm uses a combination of sampling and splatting techniques, that are extended to integrate display of vector field data within the image. DOE

TOWARD REUSABLE GRAPHICS COMPONENTS IN Ada M.S. Thesis
Sam-Kyu Lim Mar. 1993 119 p
(AD-A262568; AFIT/GCS/ENG/93M-03) Avail: CASI HC A06/MF A02

This thesis demonstrates and illustrates a way of developing reusable graphics software components in Ada associated with a C++/C library. The work was carried out using object-oriented software development techniques that were used to analyze, design and implement a partial flight simulator. The objective of this thesis was to present a way of building reusable software components with Ada in a graphics application environment. An object-oriented approach was taken in the development of a set of reusable graphics software components for a flight simulator domain. A selection of a set of reusable software components came from domain analysis. These components were analyzed in detail, then redesigned to demonstrate and illustrate the thesis objective. Examples from design and implementation demonstrate how Ada 83 was applied in building reusable graphics software components associated with C++ routines, the limitations of Ada 83, and how Ada9X addresses these limitations. When users refer to Motif, they are usually talking about mwm, the window manager. However, when programmers mention Motif they are usually discussing the programming toolkit. This toolkit is used to develop new or modify existing applications. In this presentation, the term Motif will refer to the toolkit. Motif comes with a number of features that help users effectively use the applications built with it. The term look and feel may be overused; nonetheless, a consistent and well designed look and feel assists the user in Teaming and using new applications. The term point and click generally refers to using a mouse to select program commands. While Motif supports point and click, the toolkit also supports using the keyboard as a substitute for many operations. This gives a good typist a distinct advantage when using a familiar application. We will give an overview of the toolkit, touching on the user interface features and general programming considerations. Since the source code for many useful Motif programs is readily available, we will explain how to get these sources and touch on derived benefits. We will also point to other sources of on-line help and documentation. Finally, we will present some practical experiences developing applications. DOE

AN ASSESSMENT OF SPACE SHUTTLE FLIGHT SOFTWARE DEVELOPMENT PROCESSES
1993 184 p
(Contract NASw-4003)
(NASA-CR-193179; NAS 1.26:193179; ISBN-0-309-04880-X; LC-93-84549) Copyright Avail: CASI HC A09/MF A02

In early 1991, the National Aeronautics and Space Administration's (NASA's) Office of Space Flight commissioned the Aeronautics and Space Engineering Board (ASEB) of the National Research Council (NRC) to investigate the adequacy of the current process by which NASA develops and verifies changes and updates to the Space Shuttle flight software. The Committee for Review of Oversight Mechanisms for Space Shuttle Flight Software Processes was convened in Jan. 1992 to accomplish the following tasks: (1) review the entire flight software development process from the initial requirements definition phase to final implementation, including object code build and final machine loading; (2) review and critique NASA's independent verification and validation process and mechanisms, including NASA's established software development and testing standards; (3) determine the acceptability and adequacy of the complete flight software development process, including the embedded validation and verification processes through comparison with (1) generally accepted industry practices, and (2) generally accepted Department of Defense and/or other government practices (comparing NASA's program with organizations and projects having similar volumes of software development, software maturity, complexity, criticality, lines of code, and national standards); (4) consider whether independent verification and validation should continue. An overview of the study, independent verification and validation of critical software, and the Space Shuttle flight software development process are addressed. Findings and recommendations are presented. Derived from text

A SIMPLE PARALLEL PREFIX ALGORITHM FOR COMPACT FINITE-DIFFERENCE SCHEMES Final Report
Xian-He Sun and Ronald D. Joslin Washington Apr. 1993 31 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191448; NAS 1.26:191448; ICASE-93-16) Avail: CASI HC A03/MF A01

A compact scheme is a discretization scheme that is advantageous in obtaining highly accurate solutions. However, the resulting systems from compact schemes are tridiagonal systems that are difficult to solve efficiently on parallel computers. Considering the almost symmetric Toeplitz structure, a parallel algorithm, simple parallel prefix (SPP), is proposed. The SPP algorithm requires less memory than the conventional LU decomposition and is highly efficient on parallel machines. It consists of a prefix communication pattern and AXPY operations. Both the computation and the communication can be truncated without degrading the accuracy when the system is diagonally dominant. A formal accuracy study was conducted to provide a simple truncation formula. Experimental results were measured on a MasPar MP-1 SIMD machine and on a Cray 2 vector machine. Experimental results show that the simple parallel prefix algorithm is a good algorithm for the compact scheme on high-performance computers. Author

USERS MANUAL FOR FAULT TREE ANALYSIS CODE: CUT-TD
Norio Watanabe (Japan Atomic Energy Research Inst., Ibaraki.) and Mikio Kiyota Jun. 1992 57 p
(DE93-753272; JAERI-M-92-089) Avail: CASI HC A04/MF A01

The CUT-TD code was developed to find minimal cut sets for a given fault tree and to calculate the occurrence probability of its top event. This code uses an improved top-down algorithm which can enhance the efficiency in deriving minimal cut sets. The features in processing techniques incorporated into CUT-TD are as follows: (1) consecutive OR gates or consecutive AND gates can be coalesced into a single gate, as a result, this processing directly produces cut sets for the redefined single gate with each gate not being developed; (2) the independent subtrees are automatically identified and their respective cut sets are separately found to enhance the efficiency in processing; (3) the minimal cut sets can be obtained for the top event of a fault tree by combining their respective minimal cut sets for several gates of the fault tree; (4) the user can reduce the computing time for finding minimal cut sets and control the size and significance of cut sets by inputting a minimum probability cut off and/or a maximum order cut off; (5) the user can select events that need not to be further developed in the process of obtaining minimal cut sets (this option can reduce the number of minimal cut sets, save the computing time and assists the user in reviewing the result); (6) computing time is monitored by the CUT-TD code so that it can prevent the running job from abnormally ending due to excessive CPU time and produce an intermediate result. The CUT-TD code has the ability to restart the calculation with use of the intermediate result. A users' manual for the CUT-TD code. is provided. DOE

RESEARCH IN EFFICIENT SCIENTIFIC COMPUTATION Final Report, 1 Jan. 1990 - 31 Dec. 1992
B. N. Parlett 1992 4 p
(Contract N00014-90-J-1372)
(AD-A262084) Avail: CASI HC A01/MF A01

The more common obstacle, called curable breakdown, is handled by Look Ahead versions of the algorithm. This term was introduced earlier by Prof. Parlett and is now the generally accepted way to implement the Lanczos algorithm. Now that the algorithm is understood theoretically good implementations are being developed in many groups. Another long quest that Prof. Parlett completed in this period was to understand the phenomenon of Forward Instability in the symmetric tridiagonal QR algorithm. We now know when and only when this alarming phenomenon can occur. It is invariable associated with premature deflation of an eigenvalue. Through a series of delays the paper was not published until January 1993. In a completely different view Prof. Parlett, and a gifted student Wu-Liang Heng, developed a novel approach to the 2D Ising model problem that arises in Statistical Mechanics. The new method enables us to solve cases close to criticality for n = 30, and even up to 35. Other methods cannot get beyond n = 18 for reasonable costs. This work is only available in technical reports at present. The following lists show that a lot of other commendable work was either published or completed during this period. DTIC

TRANSFORMING AdaPT TO Ada9x

Stephen J. Goldsack (Imperial Coll. of Science and Technology, London, England.), A. A. Holzbach-Valero (Imperial Coll. of Science and Technology, London, England.), Richard A. Volz (Texas A&M Univ., Houston.), and Raymond S. Waldrop (Texas A&M Univ., Houston.) 8 Apr. 1993 35 p
(Contract NCC9-16; RICIS Proj. SE-35)
(NASA-CR-193117; NAS 1.26:193117) Avail: CASI HC A03/MF A01

How the concepts of AdaPT can be transformed into programs using the object oriented features proposed in the preliminary mapping for Ada9x are described. Emphasizing, as they do, the importance of data types as units of program, these features match well with the development of partitions as translations into Abstract Data Types which was exploited in the Ada83 translation covered in report R3. By providing a form of polymorphic type, the Ada83 version also gives support for the conformant partition idea which could be achieved in Ada83 only by using UNCHECKED CONVERSIONS. It is assumed that the reader understands AdaPT itself, but the translation into Ada83 is briefly reviewed, by applying it to a small example. This is then used to show how the same translation would be achieved in the 9x version. It is important to appreciate that the distribution features which are proposed in current mapping are not used or discussed in any detail, as those are not well matched to the AdaPT approach. Critical evaluation and comparison of these approaches is given in a separate report. Author (revised)

CONCEPT DOCUMENT OF THE REPOSITORY-BASED SOFTWARE ENGINEERING PROGRAM: A CONSTRUCTIVE APPRAISAL

20 Jan. 1992 21 p Prepared in cooperation with Applied Expertise, Inc., Houston, TX
(Contract NCC9-16; RICIS Proj. RB-04)
(NASA-CR-193125; NAS 1.26:193125) Avail: CASI HC A03/MF A01

A constructive appraisal of the Concept Document of the Repository-Based Software Engineering Program is provided. The Concept Document is designed to provide an overview of the Repository-Based Software Engineering (RBSE) Program. The Document should be brief and provide the context for reading subsequent requirements and product specifications. That is, all requirements to be developed should be traceable to the Concept Document. Applied Expertise's analysis of the Document was directed toward assuring that: (1) the Executive Summary provides a clear, concise, and comprehensive overview of the Concept (rewrite as necessary); (2) the sections of the Document make best use of the NASA 'Data Item Description' for concept documents; (3) the information contained in the Document provides a foundation for subsequent requirements; and (4) the document adequately: identifies the problem being addressed; articulates RBSE's specific role; specifies the unique aspects of the program; and identifies the nature and extent of the program's users. ADDITIONAL SUPPORT FOR THE TDK/MABL COMPUTER PROGRAM Final Report

G. R. Nickerson and Stuart S. Dunn 19 Mar. 1993 100 p
(Contract NAS8-39048)
(NASA-CR-193037; NAS 1.26:193037; SN-130; T93-0345) Avail: CASI HC A05/MF A02

An advanced version of the Two-Dimensional Kinetics (TDK) computer program was developed under contract and released to the propulsion community in early 1989. Exposure of the code to this community indicated a need for improvements in certain areas. In particular, the TDK code needed to be adapted to the special requirements imposed by the Space Transportation Main Engine (STME) development program. This engine utilizes injection of the gas generator exhaust into the primary nozzle by means of a set of slots. The subsequent mixing of this secondary stream with the primary stream with finite rate chemical reaction can have a major impact on the engine performance and the thermal protection of the nozzle wall. In attempting to calculate this reacting boundary layer problem, the Mass Addition Boundary Layer (MABL) module of TDK was found to be deficient in several respects. For example, when finite rate chemistry was used to determine gas properties, (MABL-K option) the program run times became excessive because extremely small step sizes were required to maintain numerical stability. A robust solution algorithm was required so that the MABL-K option could be viable as a rocket propulsion industry design tool. Solving this problem was a primary goal of the phase 1 work effort. A DETAILED TECHNOLOGY ROADMAP FOR SUPERCONDUCTIVITY

1 May 1992 60 p
Avail: CASI HC A04/MF A01

Superconductors are materials that conduct electricity without resistance and exhibit other unique electromagnetic properties. Because of these properties, they have potential application in the aerospace industry in such areas as very fast electronics, compact motors/generators/actuators, energy storage devices, and extremely sensitive sensors. A description of superconductors is given. Topics covered include: history of superconductors; superconductor properties; Josephson Effect; electrical effects; magnetic effects exclusion; applications to aerospace products; and magnetically levitated vehicles. IMPLEMENTATION OF A SINGLE-MATERIAL VERSION OF PAGOSA ON MIMD HYPERCUBES

D. R. Gardner, D. D. Cline, and C. T. Vaughan Jun. 1992 27 p
Prepared in cooperation with Sandia National Labs., Livermore, CA
(Contract DE-AC04-76DP-00789)
(SAND-92-0640; UC-705) Avail: CASI HC A03/MF A01

A single-material version of the PAGOSA code has been implemented on two multiple-instruction, multiple-data (MIMD) hypercube massively parallel computers. PAGOSA is an explicit, Eulerian high-speed flow hydrodynamics code developed in CM Fortran by Los Alamos National Laboratory for the Thinking Machines Corporation Connection Machine-2 (CM-2). The CM-2 is a single-instruction, multiple-data (SIMD) computer. In the work described here, a version of PAGOSA which treats hydrodynamic flow of a single ideal gas was converted to Fortran 77, and domain decomposition and interprocessor communication routines were added to enable the code to run on the nCUBE 2 and Intel iPSC/860 hypercubes. In this report, the conversion process is described and a test problem illustrating the simulation of three-dimensional shock wave physics problems is displayed. We also present scaled speedup data which demonstrates the performance of the code on the two hypercubes. In particular, using the MIMD version of PAGOSA to simulate a simple blast wave we achieved grind times of 16.4 and 5.82 microseconds with corresponding scaled speedups of 55.3 and 43.6 on 64 nodes of nCUBE 2 and the Intel iPSC/860, respectively. A preliminary performance comparison of PAGOSA on the CM-2, the nCUBE 2, and the Intel iPSC/860 indicates that the unoptimized code runs at similar speeds on all three machines. Author (revised)

MODELLING TEMPORAL ABDUCTIVE EXPLANATION

Eugene Santos, Jr. 11 Mar. 1993 24 p
(AD-A263096; AFIT/EN/TR-93-01) Avail: CASI HC A03/MF A01

Abductive reasoning and temporal reasoning have for the most part remained separate fields of study. Models for either tasks have made overly-simplistic assumptions about the other in order to concentrate on small highly-domain specific tasks. For example, existing abductive models have precluded any temporal information in their formulations whereas temporal models do not address abduction being only concerned with consistency issues. We present a unified approach to merging abductive and temporal reasoning. This approach properly subsumes existing abductive models as well as temporal ones and provides a precise framework for explanatory reasoning. Furthermore, effective algorithms for this new model are developed based on linear programming techniques. DTIC

DISTRIBUTED VIRTUAL SYSTEM (DIVIRS) PROJECT Semiannual Progress Report No. 10

Herbert Schorr and B. Clifford Neuman Jun. 1993 23 p
(Contract NCC2-539)
(NASA-CR-193234; NAS 1.26:193234) Avail: CASI HC A03/MF A01

As outlined in our continuation proposal 92-ISI-50R (revised) on contract NCC 2-539, we are (1) developing software, including a system manager and a job manager, that will manage available resources and that will enable programmers to program parallel applications in terms of a virtual configuration of processors, hiding the mapping to physical nodes; (2) developing communications routines that support the abstractions implemented in item one; (3) continuing the development of file and information systems based on the virtual system model; and (4) incorporating appropriate security measures to allow the mechanisms developed in items 1 through 3 to be used on an open network. The goal throughout our work is to provide a uniform model that can be applied to both parallel and distributed systems. We believe that multiprocessor systems should exist in the context of distributed systems, allowing them to be more easily shared by those that need them. Our work provides the mechanisms through which nodes on multiprocessors are allocated to jobs running within the distributed system and the mechanisms through which files needed by those jobs can be located and accessed. COMPILER-ASSISTED MULTIPLE INSTRUCTION ROLLBACK RECOVERY USING A READ BUFFER

N. J. Alewine, S.-K. Chen, W. K. Fuchs, and W.-M. Hwu May 1993 33 p
(Grant NAG1-613)
(NASA-CR-193175; NAS 1.26:193175; UILU-ENG-93-2220; CRHC-93-11)
Avail: CASI HC A03/MF A01

Multiple instruction rollback (MIR) is a technique that has been implemented in mainframe computers to provide rapid recovery from transient processor failures. Hardware-based MIR designs eliminate rollback data hazards by providing data redundancy implemented in hardware. Compiler-based MIR designs have also been developed which remove rollback data hazards directly with data-flow transformations. This paper focuses on compiler-assisted techniques to achieve multiple instruction rollback recovery. We observe that some data hazards resulting from instruction rollback can be resolved efficiently by providing an operand read buffer while others are resolved more efficiently with compiler transformations. A compiler-assisted multiple instruction rollback scheme is developed which combines hardware-implemented data redundancy with compiler-driven hazard removal transformations. Experimental performance evaluations indicate improved efficiency over previous hardware-based and compiler-based schemes. Author (revised)

RESOURCE UTILIZATION MODEL FOR THE ALGORITHM TO ARCHITECTURE MAPPING MODEL Progress Report, period ending 30 Jun. 1993

John W. Stoughton and Rakesh R. Patel Jun. 1993 172 p
(Contract NCC1-136)
(NASA-CR-193122; NAS 1.26:193122) Avail: CASI HC A08/MF A02

The analytical model for resource utilization and the variable node time and conditional node model for the enhanced ATAMM model for a real-time data flow architecture are presented in this research. The Algorithm To Architecture Mapping Model, ATAMM, is a Petri net based graph theoretic model developed at Old Dominion University, and is capable of modeling the execution of large-grained algorithms on a real-time data flow architecture. Using the resource utilization model, the resource envelope may be obtained directly from a given graph and, consequently, the maximum number of required resources may be evaluated. The node timing diagram for one iteration period may be obtained using the analytical resource envelope. The variable node time model, which describes the change in resource requirement for the execution of an algorithm under node time variation, is useful to expand the applicability of the ATAMM model to heterogeneous architectures. The model also describes a method of detecting the presence of resource limited mode and its subsequent prevention. Graphs with conditional nodes are shown to be reduced to equivalent graphs with time varying nodes and, subsequently, may be analyzed using the variable node time model to determine resource requirements. Case studies are performed on three graphs for the illustration of applicability of the analytical theories. Author (revised)

RBSE: PRODUCT DEVELOPMENT TEAM RESEARCH ACTIVITY DELIVERABLES

1992 288 p Prepared in cooperation with GHG Corp., Houston, TX
(Contract NCC9-16; RICIS Proj. RB-05)
(NASA-CR-193115; NAS 1.26:193115) Avail: CASI HC A13/MF A03

The GHG Functions and Extensions to be added to the NASA Electronic Library System (NELS) 1.1 product are described. These functions will implement the 'output request' capability within the Object Browser. The functions will be implemented in two parts. The first part is a code to be added to the Object Browser (X version) to implement menus allowing the user to request that objects be copied to specific media, or that objects be downloaded to the user's system following a specific protocol, or that the object be printed to one of the printers attached to the host system. The second part is shell scripts which support the various menu selections. Additional scripts to support functions within the GHG shell (X version) will also be created along with the X version of the GHG Shell as initial capability for the 27 Mar. prototype. The scripts will be composed of C shell routines that will accept parameters (primary file pathways). Certain limitations in functionality will invoke Mail instead of Oracle Mail since that has yet to be delivered and the NELS invocation will default to the X-Windows version instead of the ASCII version. GRAPHICAL INTERFACE BETWEEN THE CIRSSE TESTBED AND CIMSTATION SOFTWARE WITH MCS/CTOS

Anna B. Hron Dec. 1992 126 p
(Grant NAGw-1333)
(NASA-CR-193276; NAS 1.26:193276; CIRSSE-131) Avail: CASI HC A07/MF A02

This research is concerned with developing a graphical simulation of the testbed at the Center for Intelligent Robotic Systems for Space Exploration (CIRSSE) and the interface which allows for communication between the two. Such an interface is useful in telerobotic operations, and as a functional interaction tool for testbed users. Creating a simulated model of a real world system, generates inevitable calibration discrepancies between them. This thesis gives a brief overview of the work done to date in the area of workcell representation and communication, describes the development of the CIRSSE interface, and gives a direction for future work in the area of system calibration. The CimStation software used for development of this interface, is a highly versatile robotic workcell simulation package which has been programmed for this application with a scale graphical model of the testbed, and supporting interface menu code. A need for this tool has been identified for the reasons of path previewing, as a window on teleoperation and for calibration of simulated vs. real world models. The interface allows information (i.e., joint angles) generated by CimStation to be sent as motion goal positions to the testbed robots. An option of the interface has been established such that joint angle information generated by supporting testbed algorithms (i.e., TG, collision avoidance) can be piped through CimStation as a visual preview of the path. BUILDING A GENERALIZED DISTRIBUTED SYSTEM MODEL

R. Mukkamala Jun. 1993 62 p
(Grant NAG1-1114)
(NASA-CR-193239; NAS 1.26:193239) Avail: CASI HC A04/MF A01

The key elements in the 1992-93 period of the project are the following: (1) extensive use of the simulator to implement and test - concurrency control algorithms, interactive user interface, and replica control algorithms; and (2) investigations into the applicability of data and process replication in real-time systems. In the 1993-94 period of the project, we intend to accomplish the following: (1) concentrate on efforts to investigate the effects of data and process replication on hard and soft real-time systems - especially we will concentrate on the impact of semantic-based consistency control schemes on a distributed real-time system in terms of improved reliability, improved availability, better resource utilization, and reduced missed task deadlines; and (2) use the prototype to verify the theoretically predicted performance of locking protocols, etc. Author (revised)

DYNAMIC FACTORIZATION IN LARGE-SCALE OPTIMIZATION

Gerald G. Brown and Michael P. Olson 12 Mar. 1993 38 p
(Contract AFOSR-MIPR-0007-92)
(AD-A263993; NPSOR-93-008) Avail: CASI HC A03/MF A01

Factorization of linear programming (LP) models enables a large portion of the LP tableau to be represented implicitly and generated from the remaining explicit part. Dynamic factorization admits algebraic elements which change in dimension during the course of solution. A unifying mathematical framework for dynamic row factorization is presented with three algorithms which derive from different LP model row structures: generalized upper bound rows, pure network rows, and generalized network rows. Each of these structures is a generalization of its predecessors, and each corresponding algorithm exhibits just enough additional richness to accommodate the structure at hand within the unified framework. Implementation and computational results are presented for a variety of real-world models. These results suggest that each of these algorithms is superior to the traditional, non-factorized approach, with the degree of improvement depending upon the size and quality of the row factorization identified. DEVELOPMENT OF A VISUAL SYSTEM INTERFACE TO SUPPORT A DOMAIN-ORIENTED APPLICATION COMPOSITION SYSTEM M.S. Thesis

Timothy L. Weide 23 Mar. 1993 152 p
(AD-A262489; AFIT/GCS/ENG/93M-05) Avail: CASI HC A08/MF A02

A visual system interface was designed and prototyped to generate, display, and modify domain-oriented application specifications. A visual system interface, called the Architect Visual System Interface (AVSI), supplements a text-based environment, called Architect, previously developed by two other students. Using canonical formal specifications of domain objects, Architect rapidly composes these specifications into a software application and executes a prototype of that application as a means to demonstrate its correctness before any programming language specific code is generated. Visual techniques for populating, manipulating, viewing, and composing these software application specifications within the formal object base scheme required by Architect are investigated. A Visual Specification Language (VSL) was developed to define the visual display characteristics of domain objects. AVSI provides automatic diagram layout, and also produces a textual display in a domain specific language. The Software Refinery environment, including its graphical interface tool INTERVISTA, was used to develop techniques for visualizing application data and for manipulating the formal object base. AVSI was validated with a well-understood domain, digital logic, and was found to significantly enhance Architect's application composition process. DTIC

APPLYING HIGH-LEVEL LANGUAGE PARADIGMS TO COMMUNICATIONS SOFTWARE FOR DISTRIBUTED SYSTEMS

Ellen H. Siegel Jan. 1993 131 p
(Contract F19628-91-C-0128)
(AD-A263001; CMU-CS-93-11) Avail: CASI HC A07/MF A02

Many traditional approaches to systems software do not adapt well to the complexity and scale of distributed systems, but realities of scale and the growing dependency on electronic communication and resource sharing nevertheless make some degree of distribution inescapable. Among other things, distributing systems software introduces complex failure modes and event orderings as well as issues related to heterogeneity and communication latency. Language designers have been investigating techniques for expressing complex systems more cleanly and effectively: various combinations of language mechanisms such as a parameterized module system, first-class functions, abstract types, exceptions, polymorphism, and a strong static type system can also be applied to great advantage in the design, implementation, and maintenance of distributed systems. The benefits of high-level language support in the design and implementation of communications software for distributed systems are evaluated. Three case studies illustrate the effects of distributed system design and implementation within the framework of a type-safe high-level language with advanced language mechanisms: a remote procedure call system, a distributed Linda system, and a protocol processing framework. The case studies are designed and implemented using Standard ML of New Jersey, which supports many of the relevant language features. Analysis of the design and implementation processes illustrates the benefits and drawbacks of using these advanced language features both individually and in combination to support distributed systems. DTIC

A TEMPORAL PROOF METHODOLOGY FOR REACTIVE SYSTEMS

Zohar Manna and Amir Pnueli Feb. 1993 39 p
(Grant NAG2-703)
(NASA-CR-193145; NAS 1.26:193145; AD-A262848; SU-STAN-CS-92-1463)
Avail: CASI HC A03/MF A01

The paper presents a minimal proof theory which is adequate for proving the main important temporal properties of reactive programs. The properties we consider consist of the classes of invariance, response, and precedence properties. For each of these classes we present a small set of rules that is complete for verifying properties belonging to this class. We illustrate the application of these rules on several examples. We discuss concise presentations of complex proofs using the devices of transition tables and proof diagrams. DTIC

DEVELOPMENT OF A NEW TECHNIQUE FOR IMAGE RECONSTRUCTION, ENHANCEMENT, AND VISUALIZATION Final Report, 15 Apr. 1990 - 14 Oct. 1992

Steven A. Orszag Feb. 1993 68 p
(Contract F49620-90-C-0028)
(AD-A263145; AFOSR-93-0255TR) Avail: CASI HC A04/MF A01

The problem of describing and reconstructing a surface, both analytically and visually, has been extensively addressed in this work. Various algorithms have been developed, tested, and compared and several conclusions have been reached. They are: (1) if the surface information is given on a uniform grid, the surface is best described by a set of contour plotting routines that exploit the GL graphics libraries both in a solid as well as a wire-mesh framework; and (2) if the surface information is given on a non-uniform grid, the surface can be described by Delaunay triangulation, a sophisticate graphics computer, or by interpolation back to a uniform grid. Numerous examples are given which show the advantages of these methods for specific applications. DTIC

NONRESIDENT AND ENDANGERED VARIABLES: THE EFFECTS OF CODE GENERATION OPTIMIZATIONS ON SYMBOLIC DEBUGGING
Ali-Reza Adl-Tabatabai Dec. 1992 34 p
(Contract MDA972-90-C-0035)
(AD-A263149; CMU-CS-92-221) Avail: CASI HC A03/MF A01

Instruction scheduling and register allocation/assignment are two optimizations that are commonly used in the code generation phase of modern compilers. These optimizations are important for processors with exposed instruction-level parallelism and large register files. These optimizations, however, impact the task of the symbolic debugger which attempts to present to the user a source-level view of program execution. The debuggers for most systems today usually punt the issue of optimized code, either by turning optimizations off whenever the user asks for source level debugging, or by not detecting the effects of optimizations on the source-level state. To not mislead the user, the debugger must provide feedback of the effects of optimizations. In this paper, we investigate the effects of instruction scheduling and global register allocation/assignment on symbolic debugging and present approaches that a debugger can take. DTIC

AUTOMATED REASONING WITH FUNCTION EVALUATION FOR COCOLOG
Suning Wang (McGill Univ., Montreal, Quebec.) and Peter E. Caines (McGill Univ., Montreal, Quebec.) Jun. 1992 39 p Sponsored in part by INRIA, Sophia-Antipolis, France
(Grant NSERC-A1329)
(INRIA-RR-1713; ETN-93-93912) Avail: CASI HC A03/MF A01

A logic for the study of dynamical control systems, called a Conditional Observer and Controller Logic for finite machines (COCOLOG), is addressed. The properties of consistency and completeness for each first order logical theory in the tree of such theories in a COCOLOG were previously established, but the efficacy of automatic theorem proving is a crucial issue in the implementation of COCOLOG. A function evaluation based resolution for COCOLOG called FE (Function Evaluation) resolution is presented. The unique model property of COCOLOG is first proved via the complete axiomatization property and then the decidability property of any theory in a COCOLOG is deduced. Completeness and complexity reduction of FE resolution is discussed in terms of relative truthfulness and validity. ESA

REPRESENTATION AND RECOGNITION WITH INVARIANTS AND GEOMETRIC CONSTRAINT MODELS Quarterly Progress Report, 1 Mar. - 1 Jun. 1992
3 Nov. 1992 4 p
(Contract MDA972-91-C-0053; ARPA Order 8228)
(AD-A263235) Avail: CASI HC A01/MF A01

A new approach to the recognition of solids of revolution has been developed and demonstrated. The technique involves the construction of bi-tangents to the outline curve of the occluding boundary of the object. The intersection of these bi-tangent lines corresponds to the image of a point on the axis of revolution of the object. An invariant index can then be computed from four or more such points by using the standard cross ratio. Several new projective invariants have been developed for 3D geometric features including, four 3D lines, 63D points, and 4 coplanar points with two additional points not on the plane. These invariants can be computed from two views of the object. DTIC

CONCEPT DESIGN EXAMPLE, COMPUTER AIDED STRUCTURAL MODELING (CASM). SCHEME B Instruction Report No. 2
David Wickersheimer, Gene McDermott, Carl Roth, and Michael E. Pace Jun. 1992 164 p
(Contract DACA39-86-C-0024)
(AD-A264760; WES/IR/ITL-92-3) Avail: CASI HC A08/MF A02

This is one in a series of three manuals designed to instruct in the use of the Computer Aided Structural Modeling (CASM) computer program. The manuals are composed of flowcharts which show step-by-step procedures for executing a broad range of CASM capabilities. CASM is a computer program designed to aid the structural engineer in the preliminary design and evaluation of structural building systems by the use of three-dimensional (3-D) interactive graphics. This manual contains one of three different framing schemes for the same 1-2 story office building. The examples contain a complete range of capabilities to permit framing comparisons, including 3-D geometry modeling, criteria specifications, development of loads (snow, wind, seismic, dead, and live), drawing structural elements, preliminary analysis and design of structural elements, and quantity take-offs. DATA PROBE USER'S GUIDE
D. A. Sauder Mar. 1993 61 p Sponsored by Assistant Secretary of Defense (Production and Logistics), Washington, DC, Computer-aided Acquisition and Logistic Support Program Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-178655; NISTIR-5141) Avail: CASI HC A04

Data Probes are software tools built using the emerging international Standard for the Exchange of Product Model Data (STEP). A Data Probe is created from an information model written in the Express modeling language. A Data Probe is used to create, edit, or view data that conforms to the specification found in the information model from which it is created. It is also used to conveniently view information from the information model. Data Probe was built at the National Institute of Standards and Technology (NIST) to assist in the development of STEP. A Data Probe may, however, be used by anyone that wishes to create and edit data corresponding to an information model. Data Probe is available as public domain software. The document explains what Data Probes are, discusses what is involved in creating a Data Probe, explains how to run a Data Probe, and provides a detailed explanation of the commands needed to use a Data Probe. POLYNOMIAL SPACE POLYNOMIAL DELAY ALGORITHMS FOR LISTING FAMILIES OF GRAPHS
L. A. Goldberg 1992 8 p Presented at the ACM Symposium on the Theory of Computing, San Diego, CA, May 1993
(Contract DE-AC04-76DP-00789)
(DE93-010677; SAND-92-2483C; CONF-9305153-1) Avail: CASI HC A02/MF A01

The main result of this paper is a method that turns any almost sure sentence in the first order language of graphs into a deterministic polynomial space polynomial delay algorithm for listing the graphs that satisfy the sentence (our result is the first such method). Our work builds upon earlier work of Fagin. In particular, Fagin defined an infinite collection of combinatorial axioms and showed that for any fixed integer k almost every graph satisfies the kth axiom in his collection. DOE

FULL ABSTRACTION FOR A SHARED VARIABLE PARALLEL LANGUAGE
Stephen Brookes Apr. 1993 21 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A263547; CMU-CS-93-141) Avail: CASI HC A03/MF A01

We give a new denotational semantics for a shared variable parallel programming language and prove full abstraction: the semantics gives identical meanings to commands if and only if they induce the same partial correctness behavior in all program contexts. The meaning of a command is a set of 'transition traces', which record the ways in which a command may interact with and be affected by its environment. We show how to modify the semantics to incorporate new program constructs, to allow for different levels of granularity or atomicity, and to model fair infinite computation, in each case achieving full abstraction with respect to an appropriate notion of program behavior. DTIC

NESL: A NESTED DATA-PARALLEL LANGUAGE (VERSION 2.6)
Guy E. Blelloch Apr. 1993 57 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A263548; CMU-CS-93-129) Avail: CASI HC A04/MF A01

This report describes NESL, a strongly-typed, applicative, data-parallel language. NESL is intended to be used as a portable interface for programming a variety of parallel and vector supercomputers, and as a basis for teaching parallel algorithms. Parallelism is supplied through a simple set of data-parallel constructs based on sequences (ordered sets), including a mechanism for applying any function over the elements of a sequence in parallel and a rich set of parallel functions that manipulate sequences. NESL fully supports nested sequences and nested parallelism -the ability to take a parallel function and apply it over multiple instances in parallel. Nested parallelism is important for implementing algorithms with complex and dynamically changing data structures, such as required in many graph and sparse matrix algorithms. NESL also provides a mechanism for calculating the asymptotic running time for a program on various parallel machine models, including the parallel random access machine (PRAM). This is useful for estimating running times of algorithms on actual machines and, when teaching algorithms, for supplying a close correspondence between the code and the theoretical complexity. DTIC

CLASS NOTES: PROGRAMMING PARALLEL ALGORITHMS CS 15-840B (FALL 1992)
Guy E. Blelloch and Jonathan C. Hardwick Feb. 1993 142 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A263549; CMU-CS-93-115) Avail: CASI HC A07/MF A02

These are the lecture notes for CS 15-840B, a hands-on class in programming parallel algorithms. The class was taught in the fall of 1992 by Guy Blelloch, using the programming language, NESL. It stressed the clean and concise expression of a variety of parallel algorithms. About 35 graduate students attended the class, of whom 28 took it for credit. These notes were written by students in the class, and were then reviewed and organized by Guy Blelloch and Jonathan Hardwick. The sample NESL code has been converted from the older LISP-style syntax into the new NIL-style syntax. These notes are not in a polished form, and probably contain several errors and omissions, particularly with respect to references in the literature. DTIC

CAPABILITY MATURITY MODEL FOR SOFTWARE, VERSION 1.1
Mark C. Paulk, Bill Curtis, Mary Beth Chrissis, and Charles V. Weber Feb. 1993 84 p
(AD-A263403; CMU/SEI-93-TR-24; ESC-TR-93-177) Avail: CASI HC A05/MF A01

A technical overview of the Capability Maturity Model for Software reflecting Version 1.1 is provided. Specifically, the process maturity framework of five maturity levels, the structural components that comprise the CMM, how the CMM is used in practice, and future directions of the CMM are described. This paper serves as one of the best sources for understanding the CMM, and it should clear up some of the misconceptions associated with software process maturity as advocated by the SEI. DTIC

PERFORMANCE ANALYSIS OF SUBSPACE METHODS Final Report, 1 Apr. 1990 - 31 Mar. 1993
Bhaskar D. Rao 31 Mar. 1993 26 p
(Contract DAAL03-90-G-0095)
(AD-A263984; ARO-26802.20-MA-SDI) Avail: CASI HC A03/MF A01

The main focus of this research was determining the accuracy of subspace based methods for estimating the Direction of Arrival (DoA) of multiple sources from measurements obtained at the output of a sensor array. Subspace methods like MUSIC (MUltiple SIgnal Classification), ESPRIT (Estimation of Signal Parameters via Rotational Invariant Techniques), the Minimum-Norm methods have recently received much attention, and their estimation accuracy as well as a rigorous comparative study is of much interest. This was the goal of this research. Of particular interest was the affect of spatial smoothing on the performance of the subspace methods. Spatial smoothing is useful in dealing with coherent sources and for the possible enhancement of the performance of the methods. Also examined were the implementation issues associated with these methods. As opposed to implementing a single algorithm, implementing a signal processing task which consists of several stages on special purpose hardware gives prominence to the interesting issues of partitioning, and composite tasking, which are examined in this research. We believe our results have significantly improved the understanding of the performance of subspace methods, and have lead to interesting insights into the implementation issues. DTIC

REACTIVE INTEGRATION FOR TRADITIONAL PROGRAMMING LANGUAGES
David Garlan and Curtis Scott Dec. 1992 16 p
(Contract MDA972-92-J-1002)
(AD-A263986; CMU-CS-92-217) Avail: CASI HC A03/MF A01

Reactive integration based on event broadcast is an increasingly important technique for developing systems. However, the use of this technique has largely been confined to tool integration systems - in which tools exist as independent processes - and special-purpose languages - in which specialized forms of event broadcast are designed into the language from the start. This paper broadens the class of systems that can benefit from this approach by showing how to augment general-purpose programming languages with facilities for implicit invocation. We illustrate the approach in the context of the Ada language, and highlight the important design considerations that arise in extending such languages with facilities for reactive integration. DTIC

AUTOMATED MODELING OF PHYSICAL SYSTEMS
P. P. Nayak Sep. 1992 315 p
(Contract NCC2-537; NAG2-581; ARPA Order 6822)
(NASA-CR-193256; NAS 1.26:193256; AD-A263755; SU-STAN-CS-92-1443) Avail: CASI HC A14/MF A03

Effective reasoning about complex physical systems requires the use of models that are adequate for the task. Constructing such adequate models is often difficult. In this dissertation, we address this difficulty by developing efficient techniques for automatically selecting adequate models of physical systems. We focus on the important task of generating parsimonious causal explanations for phenomena of interest. Formally, we propose answers to the following: (1) what is a model and what is the space of possible models; (2) what is an adequate model; and (2) how do we find adequate models. We define a model as a set of model fragments, where a model fragment is a set of independent equations that partially describes some physical phenomenon. The space of possible models is defined implicitly by the set of applicable model fragments: different subsets of this set correspond to different models. An adequate model is defined as a simplest model that can explain the phenomenon of interest, and that satisfies any domain-independent and domain-dependent constraints on the structure and behavior of the physical system. We show that, in general, finding an adequate model is intractable (NP-hard). We address this intractability, by introducing a set of restrictions, and use these restrictions to develop an efficient algorithm for finding adequate models. The most significant restriction is that all the approximation relations between model fragments are required to be causal approximations. In practice this is not a serious restriction because most commonly used approximations are causal approximations. We also develop a novel order of magnitude reasoning technique, which strikes a balance between purely qualitative and purely quantitative methods. DTIC

CONCEPT FORMULATION PROCESS AID FOR TRADE-OFF DETERMINATION: OPERATOR'S GUIDE Final Report, Apr. 1991 - Sep. 1992
Gary L. Page, H. R. Blacksten, B. L. Elder, Paul J. Sticha, and Michael J. Singer Mar. 1993 73 p
(Contract DAHC35-89-D-0046)
(AD-A263756; ARI-93-07) Avail: CASI HC A04/MF A01

This report describes the structure of the prototype concept formulation process aid for trade-off determination. The goal was to adapt previously developed models for use during a specific step in the development of a training device. This report identifies the hardware requirements and the necessary configuration and describes the installation procedures. A brief overview of the aiding system execution and use is presented. The report also describes the structure and function of the program files. The data elements, links between elements, and aiding functions are described in the context of the program routines. DTIC

EFFICIENT ALGORITHMS FOR THE EVALUATION OF PLANAR NETWORK RELIABILITY Final Report
A. Satyanarayana and R. Tindell 15 Mar. 1993 22 p
(Contract DAAL03-90-G-0078)
(AD-A263602; TR-9302; ARO-25706.10-MA) Avail: CASI HC A03/MF A01

Computation of the all-terminal reliability for general classes of networks is NP-hard. The problem of characterizing subclasses of networks and designing efficient algorithms to compute their reliability is a major area of current research in network reliability. Supported by the ARO grant DAAL03-90-G-0078, we have made significant progress in enlarging the class of planar networks for which there exists efficient all-terminal reliability algorithms. The importance of this work is enhanced by the recent proof of Vertigan that the all-terminal network reliability problem for the full class of planar networks is NP-hard. A important outgrowth of our work is the discovery of general techniques for developing O(n log n) algorithms for a greatly enlarged class of planar and nonplanar networks. DTIC

A REDESIGNED ISIS AND META SYSTEM UNDER MACH Quarterly Status Report No. 1
Kenneth P. Birman and Keith Marzullo 1 Jan. 1993 17 p
(Contract N00014-92-J-1866)
(AD-A263576) Avail: CASI HC A03/MF A01

This status report covers activities of the Isis project during the first quarter of 1992. This is our first progress report under ONR funding, but because these status reports are intended to be brief and our proposal was recently funded, we assume that the reader has some background regarding the goals and status of our effort, and focus instead on technical accomplishments during the report period and goals for the next three months. Readers unfamiliar with our work could start by reading some of the papers cited below, such as TR 1216. During the report period, the Isis effort has achieved a major milestone in its effort to redesign and reimplement the Isis system using Mach and Chorus as target operating system environments. In addition, we completed a number of publications that address issues raised in our prior work; some of these have recently appeared in print, while others are now being considered for publication in a variety of journals and conferences. ALGORITHMS FOR POINT SET CONGRUENCE Final Report, 15 Aug. 1992 - 14 Feb. 1993
Paul J. Heffernan 31 Mar. 1993 21 p
(Contract DAAL03-92-G-0378)
(AD-A264016; ARO-30778.3-MA) Avail: CASI HC A03/MF A01

The primary purpose of the project was to expand research in point matching, by applying the perturbation technique and the approximate algorithm paradigm to more complex problem formulations. The main results of this research are contained in the paper 'Generalized approximate algorithms for point set congruence'. This paper is still undergoing revisions, and a copy of the most recent draft is included. A device called the (e,k)-map, which is a more general measure of point set congruence than the one previously examined by the investigator is introduced. Ways to construct the (e,k)-map are discussed. While the investigator's previous work was limited to equal cardinality, planar point sets, this current work has expanded attention both to point sets of unequal cardinality and to point sets in higher dimensions. The investigator has even begun the study of projective congruence, in which one compares a 2-dimensional image with the family of projections of a 3-dimensional model. DTIC

ACCELERATING THE TRANSFER OF TECHNOLOGY FOR IMPLEMENTING DOMAIN SPECIFIC SOFTWARE ARCHITECTURES Final Report
Vincent P. Heuring and William M. Waite 12 Apr. 1993 5 p
(Contract DAAL03-91-G-0203)
(AD-A264017; ARO-28950.1-MA) Avail: CASI HC A01/MF A01

The purpose of the research effort was to find one or more clients within the DoD community to help evaluate the Eli system when applied to problems of interest to the DoD. Information was solicited from a number of DoD agencies, and finally formed a relationship with a group at the Naval Postgraduate School (NPS). As a result of that relationship, a formal specification for the NPS language, PSDL, using the EH system was developed. That specification was subsequently modified by NPS personnel whom were trained in the use of the Eli system, and the resulting PSDL translator is being used by NPS personnel. The research also led to further modifications to the Eli system. A literate programming tool was added to Eli that has proven to be a significant aid in organizing and explaining specifications. TURNING SOS RULES INTO EQUATIONS
Luca Aceto (Hewlett-Packard Labs., Pisa, Italy.), Bard Bloom (Cornell Univ., Ithaca, NY.), and Frits W. Vaandrager (Amsterdam Univ., Netherlands.) Jun. 1992 47 p
(Grant NSF CCR-90-03441)
(CWI-CS-R9218; ETN-93-93231) Copyright Avail: CASI HC A03/MF A01

Many process algebras are defined by Structural Operation Semantics (SOS). Most such definitions are structured and fit the GSOS format. A procedure for converting any GSOS language definition to a finite complete equational axiom system which characterizes strong bisimulation of processes, is given. The procedure introduces new operations. The method applies to almost all SOS systems for process algebras. The following is shown: how to express an arbitrary smooth operation as a sum of smooth distinctive operations; and how to introduce auxiliary smooth operations which do copying in the equation rather than in the operation. Completeness is discussed and variations of the method are studied. ESA

ESTIMATING Ada SYSTEM SIZE DURING DEVELOPMENT Interim Report, Oct. 1989 - Dec. 1991
W. M. Evanco, W. M. Thomas, and W. W. Agresti Dec. 1992 30 p
(Contract F19628-89-C-0001)
(AD-A263880; MTR-91W00132; RL-TR-92-318) Avail: CASI HC A03/MF A01

A set of four models is developed for estimating the size of Ada systems at intermediate points in a software development project. The motivation for the models is the need to take advantage of current information about the evolving Ada product to improve the estimate of system size. The models are based on successively more detailed design and implementation data. An empirical investigation using multivariate regression analysis was conducted on a set of twenty-one Ada subsystems. As more detail was incorporated into the models, a greater fraction of the variation in lines of code as measured by the coefficient of determination was explained. DTIC

XRONOS: A TIMING ANALYSIS SOFTWARE PACKAGE. USER'S GUIDE, VERSION 3.00
L. Stella (Osservatorio Astronomico, Brera, Milan, Italy.), L. Angelli (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.), and Chris Barron, ed. Paris ESA Sep. 1992 109 p
(NASA-TM-109222; NAS 1.15:109222; ESA-TM-165; ISBN-92-9092-221-4; ETN-93-93717) Copyright Avail: CASI HC A06/MF A02; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

XRONOS is a general purpose timing analysis package. Although it was designed mainly for x-ray astronomy, XRONOS is basically detector and wavelength independent. It has been used to analyze data from the Einstein Observatory, Exosat and Ginga, as well as optical photometry and helioseismology data. It includes programs for: light curve(s), hardness ratio and color-color plotting, epoch folding, power spectrum, autocorrelation, cross correlation, time skewness, and statistical analysis. An overview of XRONOS and walkthrough of a XRONOS session are presented. The QDP/PLT plotting and function fitting program used by XRONOS is outlined and the algorithm and features of XRONOS are detailed. ESA

AHP VERSION 5.1 USER'S MANUAL
J. C. Watkins and L. S. Ghan Oct. 1992 115 p
(Contract DE-AC07-76ID-01570)
(DE93-007050; EGG-ERTP-10585) Avail: CASI HC A06/MF A02

As decisions become more and more complex, decision makers are faced with the challenge of sorting through many variables to arrive at a sound decision. The Analytical Hierarchy Process (AHP) is a tool, that allows a systematic, logical approach to reducing complex issues into manageable pieces. The decision maker can then sort through the variables and determine to what degree a particular variable should influence the final decision. The power of the AHP as a management tool comes from the fact that it reduces complex problems to many simple pairwise decisions. Only two items need be compared against one another - a much simpler task than comparing an item to all the others simultaneously. By arranging the items that influence a decision in the form of a matrix and comparing appropriate pairs in this matrix to each other, each item can be compared with every other item. Matrix algebra can then operate on this matrix and rank each item according to its importance to the final decision. DOE

SOFTWARE TESTING USING THE IEEE STANDARDS
J. Klamerus and J. Weeks 1992 23 p Presented at the STAR 1993: Software Testing Analysis and Review: INGRES World 1993 Conference,

Monterey, CA; Santa Clara, CA, 2-6 May 1993; 9-13 May 1993
(Contract DE-AC04-76DP-00789)
(DE93-009833; SAND-92-2521C; CONF-9305160-1; CONF-9305161-1)
Avail: CASI HC A03/MF A01

Testing is an important part of the software application development process. To achieve quality software deliverables and to avoid costly redevelopment of program code or repair of bad data, testing must be performed throughout the software development life cycle. A software engineering process to produce a software test plan based upon the 'IEEE (Institute of Electrical and Electronics Engineers) Software Engineering Standards Collection' guidelines and corporate guidelines is discussed. Demonstrated examples of the software testing process involving interactive graphical user interface and standard ASCII text forms-based software are provided. Sandia National Laboratories has a Software Quality Assurance Department which provides corporate guidelines, in addition to recommending the use of IEEE processes. Both corporate guidelines and a specific subset of the IEEE guidelines were applied to the software development projects discussed. The rationale for applying a specific subset of the IEEE guidelines for each of the software on development projects are given. The development of the test procedures in the INGRES/WINDOWS 4GL environment (graphical user interface) as well as in the INGRES/ABF environment (Applications-By-Forms, ASCII Text) are be presented and contrasted. The documentation of the testing process and results are explained. DOE

USING THE MACH COMMUNICATION PRIMITIVES IN X11

Michael Ginsberg (Microsoft Corp., Redmond, WA.), Robert V. Baron, and Brian N. Bershad Mar. 1993 10 p
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A264049; CMU-CS-93-121) Avail: CASI HC A02/MF A01

We have modified the X11 windowing system to use the native communication facilities of the Mach 3.0 microkernel. Our new implementation can rely on Mach's low-overhead IPC facility as a direct replacement for sockets, or it can use shared memory as a transport between X11 clients and the server. On conventional BSD UNIX systems, X11 communication is done through sockets. Because a user-level process implements UNIX functionality on top of Mach 3.0, a socket-based version of X11 performs substantially worse than when running a monolithic UNIX kernel. Using Mach IPC as the transport between X11 clients and the server, X11 performance is slightly better than that of a monolithic system in which sockets are implemented inside the kernel as opposed to within a user level process. Using Mach's shared memory facilities as the transport, we have measured performance improvements of over 40%. DTIC

HIGH PERFORMANCE COMPUTING: ADVANCED RESEARCH PROJECTS AGENCY SHOULD DO MORE TO FOSTER PROGRAM GOALS. REPORT TO THE CHAIRMAN, COMMITTEE ON ARMED SERVICES, HOUSE OF REPRESENTATIVES

May 1993 42 p Original contains color illustrations
(GAO/IMTEC-93-24; B-252539) Avail: CASI HC A03/MF A01; GAO, PO Box 6015, Gaithersburg, MD 20877 HC

The federal High Performance Computing and Communications Initiative is a research and development effort that seeks to significantly accelerate the availability and utilization of high performance computers and networks in order to better address these challenges. At $275 million in fiscal year 1993, the Advanced Research Projects Agency (ARPA) has the largest budget of any single agency participating in the $800-million federal initiative. Given the importance of this initiative and ARPA'S dominant role in it, the House Armed Services Committee asked GAO to assess the program, particularly (1) the agency's distribution of advanced computers to research sites, (2) its interaction with the research community, and (3) the balance between hardware and software investments in the ARPA program. While ARPA has fostered significant advances in high-performance computing research and development for a decade, its current program has shortcomings in several areas. First, its placing of new computers at laboratories, while important to facilitating research, has focused on just a few massively parallel processing machines. Researchers need access to a broader range of new computing technologies to explore all promising alternatives. Second, the agency's limited interactions with the technical community may hinder the rapid progress needed to achieve its ambitious program goals. ARPA has been weak in disseminating program information, soliciting input from the research community, and publishing performance data. Finally, while much progress has been made in hardware development, software remains too primitive to make massively parallel processing systems useful. ARPA'S goal of achieving a thousand-fold increase in useful computing power by 1996 will likely not be met without greater emphasis on the development of system software. Derived from text

USING PENELOPE TO ASSESS THE CORRECTNESS OF NASA Ada SOFTWARE: A DEMONSTRATION OF FORMAL METHODS AS A COUNTERPART TO TESTING Final Report

Carl T. Eichenlaub, C. Douglas Harper, and Geoffrey Hird Washington May 1993 158 p
(Contract NAS1-18972; RTOP 505-64-10-05)
(NASA-CR-4509; NAS 1.26:4509) Avail: CASI HC A08/MF A02

Life-critical applications warrant a higher level of software reliability than has yet been achieved. Since it is not certain that traditional methods alone can provide the required ultra reliability, new methods should be examined as supplements or replacements. This paper describes a mathematical counterpart to the traditional process of empirical testing. ORA's Penelope verification system is demonstrated as a tool for evaluating the correctness of Ada software. Grady Booch's Ada calendar utility package, obtained through NASA, was specified in the Larch/Ada language. Formal verification in the Penelope environment established that many of the package's subprograms met their specifications. In other subprograms, failed attempts at verification revealed several errors that had escaped detection by testing. Author (revised)

AN APPLICATION PROTOCOL FOR CAD TO CAD TRANSFER OF ELECTRONIC INFORMATION

Charles C. Azu, Jr. Mar. 1993 13 p
(AD-A264554) Avail: CASI HC A03/MF A01

The exchange of Computer Aided Design (CAD) information between dissimilar CAD systems is a problem. This is especially true for transferring electronics CAD information such as multi-chip module (MCM), hybrid microcircuit assembly (HMA), and printed circuit board (PCB) designs. Currently, there exists several neutral data formats for transferring electronics CAD information. These include IGES, EDIF, and DXF formats. All these formats have limitations for use in exchanging electronic data. In an attempt to overcome these limitations, the Navy's MicroCIM program implemented a project to transfer hybrid microcircuit design information between dissimilar CAD systems. The IGES (Initial Graphics Exchange Specification) format is used since it is well established within the CAD industry. The goal of the project is to have a complete transfer of microelectronic CAD information, using IGES, without any data loss. An Application Protocol (AP) is being developed to specify how hybrid microcircuit CAD information will be represented by IGES entity constructs. The AP defines which IGES data items are appropriate for describing HMA geometry, connectivity, and processing as well as HMA material characteristics. DTIC

QUALITATIVE METHODS IN COMPUTER VISION Final Report, 1 Jun. 1991 - 30 Sep. 1992

Azriel Rosenfeld Jan. 1993 10 p
(Grant AF-AFOSR-0239-91)
(AD-A264335; AFOSR-93-0214TR) Avail: CASI HC A02/MF A01

Current object recognition systems can only recognize a limited class of objects. Objects having variable numbers of parts and only loosely constrained shapes cannot be modeled and recognized by these systems. The PI proposed the use of a data structure called the VAPOR (Variable APpearance Object Representation) model to represent objects with these kinds of variable appearances and develop a search procedure called MOSS (MOdel Space Search) to find instances of these models in two-dimensional image data. The VAPOR model is an idealization of the object; all instances of the model in the image are variations from ideal appearance. The variations are evaluated by the description length of the model, measured in information-theoretic bits. MOSS selects the best model for the given image data by choosing the minimal length description. It was demonstrated how the system performs in a simple domain of circles and polygons and in the complex domain of finding cloverleaf intersections in aerial images of roads. DTIC

MEMORY DRIVEN FEATURE-BASED DESIGN Interim Report, Feb. 1988 - Dec. 1992
Y. H. Pao, F. L. Merat, and G. M. Radack Jan. 1993 96 p
(Contract F33615-87-C-5250)
(AD-A264697; WL-TR-93-4021) Avail: CASI HC A05/MF A01

The act of design is a critical operation in the whole train of event's of manufacturing. Improvement of the efficiency and effectiveness of the design process would certainly have a major effect on the entire manufacturing operation as a whole. Engineering design seems to be an admixture of synthesis and analysis activities with synthesis dominating the conceptual design and embodiment design phases of the activity; and analysis dominating the problem definition and detailing phases of the activity. In addition, in nearly all phases of the design procedure, the designer often finds it helpful to be able to recollect many other previous designs or pertinent portions of such similar designs; and to be able to visualize or sketch variations on a theme and to be able to evaluate those comparatively. This is especially true for circumstances where the person has not had extensive personal experience in this matter. The research reported on in this document focuses on that aspect of design and planning. Namely, how stores of public (handbook type) knowledge and memory of private (episodic) knowledge can be and should be used effectively in combination with computer-based systems, in support of designers and fabricators. THE MIDWAY DISTRIBUTED SHARED MEMORY SYSTEM
Brian N. Bershad, Matthew J. Zekauskas, and Wayne A. Sawdon Mar. 1993 13 p
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A264645; CMU-CS-93-119) Avail: CASI HC A03/MF A01

This paper describes the motivation, design and performance of Midway, a programming system for a distributed shared memory multicomputer (DSM) such as an ATM-based cluster, a CM-5, or a Paragon. Midway supports a new memory consistency model called entry consistency. Entry consistency guarantees that shared data becomes consistent at a processor when the processor acquires a synchronization object known to guard the data. Entry consistency is weaker than other models described in the literature, such as processor consistency and release consistency, but it makes possible higher performance implementations of the underlying consistency protocols. Midway programs are written in C, and the association between synchronization objects and data must be made with explicit annotations. As a result, pure entry consistent programs can require more annotations than programs written to other models. In addition to entry consistency, Midway also supports the stronger release consistent and processor consistent models at the granularity of individual data items. Consequently, the programmer can tradeoff potentially reduced performance for the additional programming complexity required to write an entry consistent parallel program. DTIC

PROCEDURES FOR APPLYING Ada QUALITY PREDICTION MODELS Final Report, Oct. 1991 - Sep. 1992
D. D. Murphy, W. M. Thomas, W. M. Evanco, and W. W. Agresti Dec. 1992 86 p
(Contract F19628-89-C-0001)
(AD-A264730; MTR-90-W0000165; RL-TR-92-317) Avail: CASI HC A05/MF A01

Procedures for applying Ada software quality prediction models for purposes of model validation are described. The multivariate regression models predict metrics related to software reliability, maintainability, and flexibility. The procedures include the use of an Ada source code analysis tool and the Statistical Analysis System (SAS) to extract data from Ada source code and create data sets containing quantities needed for the models. AN APPROACH TO SOFTWARE QUALITY PREDICTION FROM Ada DESIGNS Final Report, Oct. 1989 - Sep. 1990
W. W. Agresti, W. M. Evanco, M. C. Smith, and D. R. Clarson Dec. 1992 62 p
(Contract F19628-89-C-0001)
(AD-A264731; MTR-90-W00135; RL-TR-92-315) Avail: CASI HC A04/MF A01

An ongoing research project on estimating software quality from Ada designs is discussed. The research is motivated by the need for technology to analyze designs, when they are first represented, for their likely effect on quality factors. The objective of this research is to build multivariate models relating design characteristics and environmental factors to reliability and maintainability. Early results of the research are discussed, including alternative definitions of reliability and maintainability, a representation of Ada design structure, characteristics of software project data used for analysis, and preliminary statistical results testing hypotheses concerning the effects of design structure on reliability and maintainability. ADAPTIVE NETWORKS FOR SEQUENTIAL DECISION PROBLEMS Final Report, 30 Sep. 1989 - 29 Sep. 1992
Andrew Barto 29 Sep. 1992 14 p
(Grant AF-AFOSR-0526-89)
(AD-A264756; AFOSR-93-0208TR) Avail: CASI HC A03/MF A01

Considerable progress was made in developing artificial neural network methods for solving stochastic sequential decision problems. The research focused on reinforcement learning methods based on approximating dynamic programming (DP). They used problems in the domains of robot fine motion control, navigation, and steering control in order to develop and test learning algorithms and architectures. Although most of these problems were simulated, they also began to apply DP-based learning algorithms to actual robot control problems with considerable success. Progress was made on reinforcement learning methods using continuous actions, modular network architectures, and architectures using abstract actions. Theoretical progress was made in relating DP-based reinforcement learning algorithms to more conventional methods for solving stochastic sequential decision problems. As a result of this research there is an improved understanding of these algorithms and how they can be successfully used in applications. DTIC

ELECTRONICS MIXED-MODE SIMULATION

H. G. Niera May 1993 15 p
(AD-A264734; ARFSD-TR-93003) Avail: CASI HC A03/MF A01

Mixed-mode simulation is an engineering software tool that electrical engineers are now using to design and/or analyze and troubleshoot electronic circuits that have analog as well as digital circuitry and componentry together, and can run a simultaneous simulation of them under the same environment. The object is to give the reader a thumbnail sketch of this emerging technology's evolvement in the electronic industry, and to bring the reader up-to-date on the trends and methodologies popular in this industry. Mixed-mode simulation, the latest offshoot of the computer aided engineering industry, appears to have arrived, after many false starts, as a bona fide and practical engineering tool. DTIC

NONLINEAR EXPLICIT TRANSIENT FINITE ELEMENT ANALYSIS ON THE INTEL DELTA

E. J. Plaskacz, M. R. Ramirez (Johns Hopkins Univ., Baltimore, MD.), and S. Gupta (Johns Hopkins Univ., Baltimore, MD.) 1993 20 p Presented at the 2nd Symposium on Parallel Computational Methods for Large-Scale Structural Analysis and Design, Norfolk, VA, 24-25 Feb. 1993
(Contract W-31-109-eng-38)
(DE93-009561; ANL/CTD/CP-78758; CONF-930286-1) Avail: CASI HC A03/MF A01

Many large scale finite element problems are intractable on current generation production supercomputers. High-performance computer architectures offer effective avenues to bridge the gap between computational needs and the power of computational hardware. The biggest challenge lies in the substitution of the key algorithms in an application program with redesigned algorithms which exploit the new architectures and use better or more appropriate numerical techniques. A methodology for implementing nonlinear finite element analysis on a homogeneous distributed processing network is discussed. The method can also be extended to heterogeneous networks comprised of different machine architectures provided that they have a mutual communication interface. This unique feature has greatly facilitated the port of the code to the 8-node Intel Touchstone Gamma and then the 512-node Intel Touchstone Delta. The domain is decomposed serially in a preprocessor. Separate input files are written for each subdomain. These files are read in by local copies of the program executable operating in parallel. Communication between processors is addressed utilizing asynchronous and synchronous message passing. The basic kernel of message passing is the internal force exchange which is analogous to the computed interactions between sections of physical bodies in static stress analysis. Benchmarks for the Intel Delta are presented. Performance exceeding 1 gigaflop was attained. Results for two large-scale finite element meshes are presented. DOE

COMPUTER ALGEBRA TOOLS FOR HIGHER SYMMETRY ANALYSIS OF NONLINEAR EVOLUTION EQUATIONS

V. P. Gerdt 1991 10 p Presented at the Working Conference on Programming Environments for High-Level Scientific Problem Solving, Karlsruhe, Germany, 23-27 Sep. 1991
(DE93-606089; JINR-E-5-91-402) Avail: CASI HC A02/MF A01 (US Sales Only)

This paper presents a computer-aided approach and a software package for symbolic algebraic computation to solve the problem of verifying the existence of the canonical Lie-Backlund symmetries for multicomponent quasilinear evolution equations with polynomial-nonlinearity and computing a given order symmetry. In the presence of arbitrary numerical parameters, the problem is reduced to investigation and solution of nonlinear algebraic equations in those parameters. DOE

PARCELS WITH TAGS

J. L. Sloan Oct. 1992 23 p Sponsored by NSF, Washington, DC.
(PB93-181824; NCAR/TN-377+IA) Avail: CASI HC A03/MF A01

The National Center for Atmospheric Research (NCAR) Text And Graphics System (TAGS) is a graphics and text batch output production facility. It is distributed across several networked computers which run the UNIX operating system. The control function of TAGS is implemented as multiple processes which communicate via message passing. The TAGS message passing scheme allows processes to exchange a simple form of associative memory, called a parcel, in an architecture neutral fashion. The associative memory is implemented as a binary tree containing paris of keyword and value strings ordered by collating sequence. The underlying interprocess communication mechanism is based on Berkeley internet stream sockets. The message passing scheme provides information hiding inside the message, and allows new parameters to be added to messages without recompiling or relinking intermediate modules which handle the messages. The objective of this project is automation and optimization of multiplex sequencing. This year, we have integrated direct transfer electrophoresis, automated multiplex hybridizations and automated film reading and applied this toward sequencing of three contiguous E. coli cosmids. Primers for the directed dideoxy sequence walking and sequence confirmation steps were synthesized with a 15 base tag complimentary to an alkaline phosphatase conjugate. A higher throughput synthesis device is well along in testing as are new automated hybridization devices. We have developed software for automatically annotating ORF's and databases of precise terminology of proteins and RNA. DOE

DEVELOPMENT OF A PC CODE PACKAGE FOR THE ANALYSIS OF RESEARCH AND POWER REACTORS
N. Urli (Institut Rudjer Boskovic, Zagreb, Yugoslavia.) Jun. 1992 19 p
(DE92-638517; IAEA-R-5132-F) Avail: CASI HC A03/MF A01 (US Sales Only)

Computer codes available for performing reactor physics calculations for nuclear research reactors and power reactors are normally suited for running on mainframe computers. With the fast development in speed and memory of the PCs and affordable prices, it became feasible to develop PC versions of commonly used codes. The present work performed under an IAEA sponsored research contract has successfully developed a code package for running on a PC. This package includes a cross-section generating code PSU-LEOPARD and 2D and 1D spatial diffusion codes, MCRAC and MCYC 1D. For adapting PSU-LEOPARD for a PC, the binary library has been reorganized to decimal form, upgraded to FORTRAN-77 standard and arrays and subroutines reorganized to conform to PC compiler. Similarly, PC version of MCRAC for FORTRAN-77 and 1D code MCYC 1D have been developed. Tests, verification and benchmark results show excellent agreement with the results obtained from mainframe calculations. The execution speeds are also very satisfactory. DOE

GIGABIT NETWORK COMMUNICATIONS RESEARCH Quarterly Research and Development Status Report No. 9, 1 Oct. - 31 Dec. 1992
31 Dec. 1992 13 p
(Contract DABT63-91-C-0001)
(AD-A264895) Avail: CASI HC A03/MF A01

The ATOMIC project utilizes inexpensive fine-grain multicomputer components to create a multi-gigabit per second local area network. This unique approach leverages recent DARPA supported research at Caltech by Prof. Charles Seitz and his students. That research produced dense and extremely fast Mosaic single-chip multicomputer nodes. ATOMIC is a unique example of network development that grows upwards from multicomputer machine networking into the domain of a LAN. The principal concerns for this quarter were performance improvement and testing of the SPARCstation ATOMIC SBus card and modification to allow multicast. DTIC

DESIGN OF A HARDWARE DISCRETE EVENT SIMULATION COPROCESSOR M.S. Thesis
David W. Daniel Mar. 1993 150 p
(AD-A262614; AFIT/GCE/ENG/93M-01) Avail: CASI HC A07/MF A02

A hardware discrete event simulation (DES) coprocessor was designed to eliminate synchronization overhead as a possible bottleneck. The target architecture is an eight node Intel iPSC/2 Hypercube, but this design has application to future CPU designs that wish to incorporate on-chip architectural features to better support parallel processor synchronization. A structural description of a general-purpose DES hardware coprocessor is given with approximately 90 percent of the components written at the gate level. The remaining components use low-level behavioral descriptions. While the DES coprocessor microcode implements the Chandy-Misra protocol, general-purpose support for a wide-range of protocols was a primary hardware design objective. DTIC

A software package was written that can facilitate efforts to develop powerful, flexible, and easy-to-use programs that can run in single-processor, massively parallel, and distributed computing environments. Particular attention was given to the difficulties posed by a program consisting of many science packages that represent subsystems of a complicated, coupled system. Methods were found to maintain independence of the packages by hiding data structures without increasing the communication costs in a parallel computing environment. Concepts developed in this work are demonstrated by a prototype program that uses library routines from two existing software systems, Basis and Parallel Virtual Machine (PVM). Most of the details of these libraries were encapsulated in routines and macros that could be rewritten for alternative libraries that possess certain minimum capabilities. The prototype software uses a flexible master-and-slaves paradigm for parallel computation and supports domain decomposition with message passing for partitioning work among slaves. Facilities are provided for accessing variables that are distributed among the memories of slaves assigned to subdomains. The software is named PROTOPAR. DOE

A MULTIARCHITECTURE PARALLEL-PROCESSING DEVELOPMENT ENVIRONMENT

Scott Townsend (Sverdrup Technology, Inc., Brook Park, OH.), Richard Blech, and Gary Cole Apr. 1993 8 p Presented at the Seventh International Parallel Processing Symposium, Newport Beach, CA, 13-16 Apr. 1993; sponsored by IEEE Computer Society
(Contract NAS3-25266; RTOP 505-62-52)
(NASA-TM-106180; E-7744; NAS 1.15:106180) Avail: CASI HC A02/MF A01

A description is given of the hardware and software of a multiprocessor test bed - the second generation Hypercluster system. The Hypercluster architecture consists of a standard hypercube distributed-memory topology, with multiprocessor shared-memory nodes. By using standard, off-the-shelf hardware, the system can be upgraded to use rapidly improving computer technology. The Hypercluster's multiarchitecture nature makes it suitable for researching parallel algorithms in computational field simulation applications (e.g., computational fluid dynamics). The dedicated test-bed environment of the Hypercluster and its custom-built software allows experiments with various parallel-processing concepts such as message passing algorithms, debugging tools, and computational 'steering'. Such research would be difficult, if not impossible, to achieve on shared, commercial systems. Author (revised)

NEURAL NETWORK SIMULATIONS ON MASSIVELY PARALLEL COMPUTERS: APPLICATIONS IN CHEMICAL PHYSICS

B. G. Sumpter, C. Getino, D. W. Noid, R. E. Guenther (Nebraska Univ., Omaha.), and C. Halloy (Tennessee Univ., Knoxville.) 1993 5 p Presented at the International Neural Network Conference, Barcelona, Spain, 9-11 Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE93-006739; CONF-9306101-1) Avail: CASI HC A01/MF A01

A fully connected feedforward neural network is simulated on a number of parallel computers (MasPar-1, Connection Machine CM5, Intel iPSC-2, and iPSC-860) and the performance is compared to that obtained on sequential vector computers (Cray YMP, Cray C90, IBM-3090) and to a scaler workstation (IBM RISC-6000). Peak performances of up to 342 million connections per second (MCPS) could be obtained on the Cray C90 using a single processor while the optimum performance obtained on the parallel computers was 90 MCPS using 4096 processors. Efficiency such as these has enabled neural network computations to be carried out for a number of chemical physics problems. Several examples are discussed: multi-dimensional function/surface fitting, coordinate transformations, and predictions of physical properties from chemical structure. DOE

PREEMPTIVE SCHEDULING WITH VARIABLE PROFILE, PRECEDENCE CONSTRAINTS AND DUE DATES

Zhen Liu and Eric Sanlaville (Paris VI Univ., France.) Feb. 1992 27 p
(INRIA-RR-1622; ETN-93-93894) Avail: CASI HC A03/MF A01

The problem of scheduling preemptive tasks subject to precedence constraints in order to minimize the maximum lateness and the makespan is addressed. The number of available parallel processors is allowed to vary in time. It is shown that when an earliest due date first algorithm provides an optimal nonpreemptive schedule for unit execution time tasks, then the preemptive priority scheduling algorithm, referred to as smallest laxity first, provides an optimal preemptive schedule for real execution time tasks. When the objective is to minimize the makespan, the same kind of result is obtained between highest level first schedules solving nonpreemptive tasks with unit execution time and the longest remaining path first schedule for the corresponding preemptive scheduling problem with real execution time tasks. These results are applied to four specific profile scheduling problems and new optimality results are obtained. ESA

Research in error estimation, mesh conditioning, and solution enhancement for finite element, finite difference, and finite volume methods has been incorporated into AUDITOR, a modern, user-friendly code, which operates on 2D and 3D unstructured neutral files to improve the accuracy and reliability of computational results. Residual error estimation capabilities provide local and global estimates of solution error in the energy norm. Higher order results for derived quantities may be extracted from initial solutions. Within the X-MOTIF graphical user interface, extensive visualization capabilities support critical evaluation of results in linear elasticity, steady state heat transfer, and both compressible and incompressible fluid dynamics. The advent of chips which include one or more CPU's, some local memory, and rudimentary communications and routing hardware has opened a new area in computer architecture design. What is the best way to connect these chips to solve particular problems? This paper defines the efficiency of a wiring scheme for a set of communication patterns. It then gives upper and lower bounds on the best efficiency achievable. It also presents simple wiring schemes for some stencil patterns used in mesh-based discrete simulations. DOE

A set of C++ classes which provide the Connection Machine (CM) programmer with a simplified interface to the PARIS (Parallel Instruction Set) library are described. Numerical test cases such as parallel arithmetic operations (scalar product, SAXPY), and a Jacobi iterative resolution, are used to perform a validation of the C++ interface. Performance results of the C++ interface are presented and compared to those obtained using the PARIS library or using high level languages of the CM-2 system such as C(star) or CM-FORTRAN. A classical example in numerical ecology is used for illustrating the performance in parallel computation with integers. ESA

EXPLOITING THE MEMORY HIERARCHY IN SEQUENTIAL AND PARALLEL SPARSE CHOLESKY FACTORIZATION

Edward Rothberg Nov. 1992 168 p
(Contracts N00039-91-C-0138; N00014-87-K-0828)
(AD-A262849; SU-Stan-CS-92-1459; CSL-TR-92-555) Avail: CASI HC A08/MF A02

Cholesky factorization of large sparse matrices is an extremely important computation, arising in a wide range of domains including linear programming, finite element analysis, and circuit simulation. This thesis investigates crucial issues for obtaining high performance for this computation on sequential and parallel machines with hierarchical memory systems. The thesis begins by providing the first thorough analysis of the interaction between sequential sparse Cholesky factorization methods and memory hierarchies. We look at popular existing methods and find that they produce relatively poor memory hierarchy performance. The methods are extended, using blocking techniques, to reuse data in the fast levels of the memory hierarchy. This increased reuse is shown to provide a three-fold speedup over popular existing approaches (e.g., SPARSPAK) on modem workstations. The thesis then considers the use of blocking techniques in parallel sparse factorization. We first describe parallel methods we have developed that are natural extensions of the sequential approach described above. These methods distribute panels (sets of contiguous columns with nearly identical non-zero structures) among the processors. The thesis shows that for small parallel machines, the resulting methods again produce substantial performance improvements over existing methods. A framework is provided for understanding the performance of these methods, and also for understanding the limitations inherent in them. Using this framework, the thesis shows that panel methods are inappropriate for large-scale parallel machines because they do not expose enough concurrency. DTIC

ADVANCED NETWORK TECHNOLOGY: BACKGROUND PAPER

Jun. 1993 86 p Original contains color illustrations
(OTA-BP-TCT-101; ISBN-0-16-041805-4) Avail: CASI HC A05/MF A01; SOD HC

Computer networks are having dramatic impacts on our lives. What were once esoteric tools used only by scientists and engineers are becoming more widely used in schools, libraries, and businesses. At the same time, researchers are working to develop even more capable networks that promise to change fundamentally the way we communicate. This background paper analyzes technologies for tomorrow's information superhighways. Advanced networks will first be used to support scientists in their work, linking researchers to supercomputers, databases, and scientific instruments. As the new networks are deployed more widely, they will be used by a broader range of users for business, entertainment, health care, and education applications. The background paper also describes six test networks that are being funded as part of the High Performance Computing and Communications Program. Author (revised)

CONTEXT SWITCH TIME SCALABILITY: BENCHMARK RESULTS

J. L. Sloan Oct. 1992 42 p Sponsored by National Science Foundation, Washington, DC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-181832; NCAR/TN-378+STR) Avail: CASI HC A03

The work a computer system performs to temporarily suspend execution of one process and resume execution of another process is called a context switch. The time it takes for a computer system to perform a context switch is often cited as an important performance metric. Lengthy context switch time can result in poor performance in process-intensive applications such as distributed servers or interactive systems. However, context switch time is usually assumed to be constant for a particular system. The document describes a benchmark program which shows that for many systems this is not the case. The program was run on a variety of UNIX-based systems at the National Center for Atmosphere Research (NCAR), and the results are given in both tabular and graphical form. They show that for many systems, context switch time increases, sometimes dramatically, with the number of concurrent processes running in the system. This non-scalability of context switch times leads to diminishing returns when, for example, upgrading to a faster processor in order to support more interactive users. NTIS

USING SYNTHETIC-PERTURBATION TECHNIQUES FOR TUNING SHARED MEMORY PROGRAMS

Robert Snelick, Joseph JaJa (Maryland Univ., College Park.), Raghu Kacker, and Gordon Lyon Mar. 1993 35 p See also PB93-161339 Sponsored in part by DARPA Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-178572; NISTIR-5139) Avail: CASI HC A03

The Synthetic Perturbation Tuning (SPT) methodology is based on an empirical approach that introduces artificial delays into the multiple-instruction stream, multiple-data stream (MIMD) program and captures the effects of such delays by using the modern branch of statistics called design of experiments. SPT provides the basis of a powerful tool for tuning MIMD programs that are portable across machines and architectures. The purpose of the paper is to explain the general approach and to extend it to address specific features that are the main source of poor performance on the shared memory programming model. These include performance degradation due to loan imbalance and insufficient parallelism, overhead introduced by synchronizations and by accessing shared data structures, and compute time bottlenecks. The authors illustrate its use on two very different case studies: a large image processing benchmark and a parallel quicksort. NTIS

DATA PARALLELISM

B. C. Gorda Sep. 1992 4 p Presented at the 26th Hawaiian International Conference on System Science: Biotechnology Computing Track, Kauai, HI, 5-8 Jan. 1993
(Contract W-7405-eng-48)
(DE93-009300; UCRL-JC-111827; CONF-930117-6) Avail: CASI HC A01/MF A01

Data locality is fundamental to performance on distributed memory parallel architectures. Application programmers know this well and go to great pains to arrange data for optimal performance. Data Parallelism, a model from the Single Instruction Multiple Data (SIMD) architecture, is finding a new home on the Multiple Instruction Multiple Data (MIMD) architectures. This style of programming, distinguished by taking the computation to the data, is what programmers have been doing by hand for a long time. Recent work in this area holds the promise of making the programmer's task easier. DOE

PARALLEL PROCESSING AND LEARNING: VARIABILITY AND CHAOS IN SELF-ORGANIZATION OF ACTIVITY IN GROUPS OF NEURONS

Annual Report, 15 Jan. 1992 - 1 Feb. 1993

George J. Mpitsos 9 Mar. 1993 3 p
(Contract F49620-92-J-0140)
(AD-A264224; AFOSR-93-0238TR) Avail: CASI HC A01/MF A01

Results of computer simulations of catalytic networks were recently published, and the problem of the effect that catalytic error has in controlling system dynamics was addressed. Simulations of large networks are being designed in order to examine spatio-temporal dynamics in reaction-diffusion systems. The aim is to develop visualization and analysis methods to apply large networks composed of biologically realistic neurons. Immunohistochemical studies examined mammalian tissues that may be useful as model systems to examine distributed function in neurotransmission and neuromodulation. It is necessary, as these and other publications indicate, not only to understand neural organization in a simple animal, but also to examine the applicability of the findings to higher animals, and, if possible, to humans. Molecular biological studies of muscarinic receptors were performed. In previous AFOSR-published work, it was shown that brief pharmacologic blocking of these receptors enhances 1-Trial associative learning. Over the past year, cloning vectors for generating fusing proteins to all of the five known muscarinic receptor subtypes in humans were developed. Our next step is to obtaine immunofluorescent antisera to the fusion proteins in order to visually identify cells containing the different muscarinic receptors. The in-between step will be to determine the specificity of the antisera. The findings will be applicable not only to our experimental animal, but also to studies of learning and pathologies in humans. DTIC

MULTIPROCESSING MCNP ON AN IBM RS/6000 CLUSTER
G. W. McKinney and J. T. West (International Business Machines Corp., Houston, TX.) 1993 7 p Presented at the American Nuclear Society (ANS) Annual Meeting, San Diego, CA, 20-24 Jun. 1993
(Contract W-7405-eng-36)
(DE93-008712; LA-UR-93-463; CONF-930601-8) Avail: CASI HC A02/MF A01

The advent of high-performance computer systems has brought to maturity programming concepts like vectorization, multiprocessing, and multitasking. While there are many schools of thought as to the most significant factor in obtaining order-of-magnitude increases in performance, such speedup can only be achieved by integrating the computer system and application code. Vectorization leads to faster manipulation of arrays by overlapping instruction CPU cycles. Discrete ordinates codes, which require the solving of large matrices, have proved to be major benefactors of vectorization. Monte Carlo transport, on the other hand, typically contains numerous logic statements and requires extensive redevelopment to benefit from vectorization. Multiprocessing and multitasking provide additional CPU cycles via multiple processors. Such systems are generally designed with either common memory access (multitasking) or distributed memory access. In both cases, theoretical speedup, as a function of the number of processors (P) and the fraction of task time that multiprocesses (f), can be formulated using Amdahl's Law $S(f,P) = 1/(1 - f + f/P)$. However, for most applications this theoretical limit cannot be achieved, due to additional terms not included in Amdahl's Law. Monte Carlo transport is a natural candidate for multiprocessing, since the particle tracks are generally independent and the precision of the result increases as the square root of the number of particles tracked. (AD-A264298; LTR93-003; AFOSR-93-0289TR) Avail: CASI HC A03/MF A01

This report summarizes the work performed during a two-year program aimed at demonstrating the feasibility of constructing a 4-dimensional neural network based on the unique properties of spectral hole burning (SHB) materials. SHB materials were synthesized and excellent quality holograms were recorded and retrieved. Both wavelength and angle multiplexing were demonstrated with no apparent crosstalk. We assembled a demonstration holographic optical neural network and tested it as a bidirectional associative memory system. The results obtained clearly demonstrate the fundamental ability to fully connect two 2D planes of digital information. Expectations are that this architecture can be extended to capacities of 10(exp 12) interconnects or greater. DTIC

RESOURCE LIMITED REASONING: A STUDY OF LITERATURE IN THE CONTEXT OF MODEL-BASED DIAGNOSIS
R. F. Riswick Sep. 1992 40 p Sponsored by Stichting Knowledge Based Systems, Netherlands
(Memo-INF-92-38; UT-KBS-92-40; SKBS-A1/92-19; ETN-93-93836)
Copyright Avail: CASI HC A03/MF A01

Model based diagnosis is concerned with finding defects in technical devices. The research in this field has concentrated on two main problems, a modeling problem and an efficiency problem. The modeling problem is to find a useful model to perform model based diagnosis. The efficiency problem is concerned with finding ways to reason about the obtained models in an efficient way. The requirement of putting model based diagnosis into practice produces an additional problem. In general, the diagnosis program to be built will not be able to use unlimited resources. The most important limitation is the costs, for example the cost of time, space, and computational power. But also, the costs of repairing a component in the system and the cost a breakdown of the system will cause. The study focuses on the cost of time. The most important question addresses how a system that provides an answer before a certain deadline can be built. Some literature from the field of real time systems and the field of metareasoning is discussed and preliminary areas about applying this theory to model based diagnosis are given. Anytime algorithms will turn out to be a possible solution to the problem of providing an answer within a particular time. In combination with metareasoning techniques, these algorithms could be used to construct a resource limited diagnostic system. ESA

THE DYNAMIC BEHAVIOR OF CONSTRAINED ADAPTIVE ARRAY SENSOR PROCESSORS
Jay S. Goldstein Dec. 1992 130 p
(AD-A262402; RL-TR-92-327) Avail: CASI HC A07/MF A02

The transient behavior of constrained wideband adaptive array sensors is examined with the goal of improving the convergence properties while simultaneously satisfying a requirement for limited computational complexity. The multichannel wideband adaptive filter is derived for the tapped-delay-line, frequency domain, lattice and Gram-Schmidt structures. The mean-square error for each structure is estimated and compared over varying degrees of difficulty with respect to the signal environment. A new multichannel wideband extension of the frequency domain structure is presented, and the performance is demonstrated to surpass that of the conventional tapped-delay line structure. It is shown via simulation that utilizing the Discrete Cosine Transform, the new structure is capable of converging at speeds which rival the more computationally expensive least square methods at no increase in the required number of adaptive coefficients. The multichannel wideband lattice structure is shown to perform better than the other structures and the least squares method of Sample Matrix Inversion. DTIC

OPTIMAL CONTROL OF THE M/G/1 QUEUE WITH REPEATED VACATIONS OF THE SERVER Programme 1: Architectures paralleles, bases de donnees, reseaux et systemes distribues
Eitan Altman and Philippe Nain Mar. 1992 20 p
(Grant FISCCSE-3321190)
(INRIA-RR-1637; ETN-93-93896) Avail: CASI HC A03/MF A01

An M/G/1 queue where the server may take repeated vacations is considered. Whenever a busy period terminates (that is, when the queue empties), the server takes a vacation of random duration. At the end of each vacation the server may either take a new vacation or resume service provided that the system is nonempty. The decision to turn the server on/off may depend on all the history of the process (which includes the number of customers and all past decisions). The optimization problem typically arises when imposing a cost structure that involves a holding cost per unit time and customer and a cost for turning the server on (a shut down cost may also be included in the latter cost). Restrictions to threshold policies where the server is turned on at the end of each vacation if and only if the queue length is greater than or equal to a fixed threshold may be desired. The study aims to establish the optimality of threshold policies over all policies for two long run average cost criteria. ESA

CLOSED-LOOP CONTROL WITH DELAYED INFORMATION Programme 1: Architectures paralleles, bases de donnees, reseaux et systemes distribues
Eitan Altman and Philippe Nain Mar. 1992 18 p
(Grant FISCCSE-3321190)
(INRIA-RR-1638; ETN-93-93897) Avail: CASI HC A03/MF A01

The theory of Markov Control Model with Perfect State Information, (MCM-PSI) requires that the current state of the system is known to the decision maker at decision instants. Otherwise, MCM with Imperfect SI (MCM-ISI) is extant. A class of MCM-ISI, where the information on the state of the system is delayed, is introduced. Such an information structure is encountered, for instance, in high speed data networks. By enlarging the state space so as to include the last known state as well as all the decisions made during the travel time of the information, it is shown that an MCM-ISI can be reduced to a MCM-PSI. This result is applied to a flow control problem. A discrete time queueing model with Bernoulli arrivals and geometric services, where the intensity of the arrival stream is controlled, is considered. At the beginning of slot $t + 1$, $t = 0, 1, 2, \ldots$, the decision maker has to select the probability of having one arrival in the current time slot from the set (p1, p2), p2 greater than 0 and less than p1 and p1 less than or equal to 1, only on the basis of the queue length and action histories in (0,t). The aim is to optimize a discounted throughout/delay criterion. An optimal policy of a threshold type, where the threshold is seen to depend on the last action, is shown to exist. ESA

STABILIZATION USING LOW-GAIN PI CONTROL: SISO CASE
Denis Mustafa 22 Jul. 1992 11 p Presented at the 1993 International Symposium on Mathematical Theory of Networks and Systems
(OUEL-1947/92; ETN-93-93878) Avail: CASI HC A03/MF A01

A characterization of a maximal class of stabilizing low gain proportional-integral (PI) controllers, in the SISO case, is given. Specifically, the following four cases are studied, where in each case a closed formula is derived for the largest gain tolerable before the controller ceases to be stabilizing: no integral gain, proportional gain increased from zero; no proportional gain, integral gain increased from zero; proportional gain increased from zero to some stabilizing value, then integral gain increased from zero; and integral gain increased from zero to some stabilizing value, then proportional gain increased from zero. The key analytical tool is a block structured guardian map that leads to closed eigenvalue formulae for the largest permissible gains. ESA

ROBOTICS AND ARTIFICIAL INTELLIGENCE FOR HAZARDOUS ENVIRONMENTS
P. F. Spelt 1993 13 p Presented at the 17th Congress of Investigation Cientifica Universidad Interamericana De Puerto Rico, San Juan, Puerto Rico, 11-12 Feb. 1993
(Contract DE-AC05-84OR-21400)
(DE93-008271; CONF-930264-1) Avail: CASI HC A03/MF A01

In our technological society, hazardous materials including toxic chemicals, flammable, explosive, and radioactive substances, and biological agents, are used and handled routinely. Each year, many workers who handle these substances are accidently contaminated, in some cases resulting in injury, death, or chronic disabilities. If these hazardous materials could be handled remotely, either with a teleoperated robot (operated by a worker in a safe location) or by an autonomous robot, then human suffering and economic costs of accidental exposures could be dramatically reduced. At present, it is still difficult for commercial robotic technology to completely replace humans involved in performing complex work tasks in hazardous environments. The robotics efforts at the Center for Engineering Systems

Advanced Research represent a significant effort at contributing to the advancement of robotics for use in hazardous environments. While this effort is very broad-based, ranging from dextrous manipulation to mobility and integrated sensing, focus is on machine learning and the high-level decision making needed for autonomous robotics. ROBUST FEEDFORWARD/FEEDBACK CONTROL SYNTHESIS FOR UNCERTAIN DYNAMICAL SYSTEMS Ph.D. Thesis

Qiang Liu 1992 218 p

Avail: Univ. Microfilms Order No. DA9307106

A robust H(sub infinity) control design method for dynamical systems with structured parametric uncertainty is developed. The proposed design methodology incorporates the internal model principle for persistent-disturbance rejection. A non-colocated control problem of flexible space structures subject to parameter variations is used to illustrate the design methodology and to address some important issues arising in robust control design. The infinity-norm parameter margin as well as the conventional gain/phase margins are employed as a stability robustness measure of a closed-loop system with structured multi-parameter variations. A proper implementation of a robust non-minimum-phase compensator for a non-zero set-point control problem is also proposed. The proposed robust control design methodology was successfully applied to the Hubble Space Telescope and the Space Station, resulting in significant improvement in system performance and stability robustness. Two approaches to robustified open-loop control of uncertain flexible systems are developed with the objective of achieving fast maneuvering and reduction of residual vibration. In the first approach, robust time-optimal control inputs are obtained by solving a parameter optimization problem subject to robustness constraints. In the second approach, a time-optimal control input is preshaped using a tapped delay filter. It is shown that new approaches provide near-minimum-time maneuvering and robust suppression of residual structural vibrations in the presence of model parameter variations. On-off reaction jet control logic for uncertain flexible spacecraft are also investigated from the viewpoint of minimizing the maneuver time, fuel consumption, and structural mode excitation. Dissert. Abstr.

THREE-PARAMETER TUNABLE TILT-INTEGRAL-DERIVATIVE (TID) CONTROLLER Patent Application

Boris J. Lurie, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 1 Feb. 1993 24 p

(Contract NAS7-918)

(NASA-Case-NPO-18492-1-CU; NAS 1.71:NPO-18492-1-CU; US-Patent-Appl-SN-023253) Avail: CASI HC A03/MF A01

A feedback control system compensator of the PID type is provided, wherein the proportional component of the compensator is replaced with a tilted component having a transfer function s to the power of -1/n. The resulting transfer function of the entire compensator more closely approximates an optimal transfer function, thereby achieving improved feedback controller. Further, as compared to conventional PID compensators, the TID compensator allows for simpler tuning, better disturbance rejection ratio, and smaller effects of plant parameter variations on closed loop response. SPURIOUS SYMPTOM REDUCTION IN FAULT MONITORING

William D. Shontz, Roger M. Records, and Jai J. Choi Jun. 1993 108 p

(Contract NAS1-18027; RTOP 505-64-13-22)

(NASA-CR-191453; NAS 1.26:191453) Avail: CASI HC A06/MF A02

Previous work accomplished on NASA's Faultfinder concept suggested that the concept was jeopardized by spurious symptoms generated in the monitoring phase. The purpose of the present research was to investigate methods of reducing the generation of spurious symptoms during in-flight engine monitoring. Two approaches for reducing spurious symptoms were investigated. A knowledge base of rules was constructed to filter known spurious symptoms and a neural net was developed to improve the expectation values used in the monitoring process. Both approaches were effective in reducing spurious symptoms individually. However, the best results were obtained using a hybrid system combining the neural net capability to improve expectation values with the rule-based logic filter. Author (revised)

MoCog1: A COMPUTER SIMULATION OF RECOGNITION-PRIMED HUMAN DECISION MAKING

William B. Gevarter Oct. 1991 20 p

(RTOP 590-12-42)

(NASA-TM-103868; A-91160; NAS 1.15:103868) Avail: CASI HC A03/MF A01

The results of the first stage of a research effort to develop a 'sophisticated' computer model of human cognitive behavior are described. Most human decision making is an experience-based, relatively straight-forward, largely automatic response to internal goals and drives, utilizing cues and opportunities perceived from the current environment. The development of the architecture and computer program (MoCog1) associated with such 'recognition-primed' decision making is discussed. The resultant computer program was successfully utilized as a vehicle to simulate earlier findings that relate how an individual's implicit theories orient the individual toward particular goals, with resultant cognitions, affects, and behavior in response to their environment. A FUZZY LOGIC OPTIMAL CONTROL LAW SOLUTION TO THE CMMCA TRACKING PROBLEM M.S. Thesis

Randy E. Nelson Mar. 1993 146 p

(AD-A262555; AFIT/GST/ENS/93M-10) Avail: CASI HC A07/MF A02

The Air Force uses the C-18 Cruise Missile Mission Control Aircraft (CMMCA) to radar track cruise missiles (CM) during test flights. Because of the complexity of the CM flight profiles, maintaining radar coverage at all times is very difficult. Optimal control theory is applied to construct a simulation providing 100% radar coverage. The simulation was divided into ten second intervals, and fuzzy logic was used at the start of each interval to determine the set point, i.e., that point in space where the CMMCA should be in ten seconds. The set point calculation's fuzzy logic balanced CMMCA maneuvering based on present and future CM positions. Three different future times were used: 60, 90, and 120 seconds ahead, and the performance for each time was compared. The simulation was performed on an IBM compatible PC with Matlab and Simulink (both by The MathWorks). The final form of the fuzzy logic provided varying radar coverage at each look ahead time for a complex CM flight path (CM in 20 degrees of bank) 1850 seconds long. At 120 seconds look ahead time, the coverage was 100%. When the same profile was performed with the CM in 30 degrees of bank, coverage was degraded, and 60 seconds look ahead performed best. DTIC

PLANNING COLLISION FREE PATHS FOR TWO COOPERATING ROBOTS USING A DIVIDE-AND-CONQUER C-SPACE TRAVERSAL HEURISTIC

Johnathan M. Weaver May 1993 161 p

(Grant NAGw-1333)

(NASA-CR-193252; NAS 1.26:193252; CIRSSE-136) Avail: CASI HC A08/MF A02

A method was developed to plan feasible and obstacle-avoiding paths

for two spatial robots working cooperatively in a known static environment. Cooperating spatial robots as referred to herein are robots which work in 6D task space while simultaneously grasping and manipulating a common, rigid payload. The approach is configuration space (c-space) based and performs selective rather than exhaustive c-space mapping. No expensive precomputations are required. A novel, divide-and-conquer type of heuristic is used to guide the selective mapping process. The heuristic does not involve any robot, environment, or task specific assumptions. A technique was also developed which enables solution of the cooperating redundant robot path planning problem without requiring the use of inverse kinematics for a redundant robot. The path planning strategy involves first attempting to traverse along the configuration space vector from the start point towards the goal point. If an unsafe region is encountered, an intermediate via point is identified by conducting a systematic search in the hyperplane orthogonal to and bisecting the unsafe region of the vector. This process is repeatedly applied until a solution to the global path planning problem is obtained. The basic concept behind this strategy is that better local decisions at the beginning of the trouble region may be made if a possible way around the 'center' of the trouble region is known. Thus, rather than attempting paths which look promising locally (at the beginning of a trouble region) but which may not yield overall results, the heuristic attempts local strategies that appear promising for circumventing the unsafe region.

A NEURAL NETWORK BASED APPROACH FOR MACHINE FAULT DIAGNOSIS
Ari M. Vepsalainen Aug. 1991 30 p
(VTT-TIED-1274; ISBN-951-38-4007-7; ETN-93-93775) Copyright Avail: CASI HC A03/MF A01

An approach to classifying the state of a machine based on vibration measurements and the use of a dynamic neural network is presented. Some comparisons are made between the presented method, the linear classifier, the third order nonlinear classifier, the Markov model based classifier, and the recurrent backpropagation network. The proposed classifier can be considered as a spatiotemporal neural network. Spatiotemporal neural networks are used to transform input patterns into time varying class number output codes. Usually, time is assumed to move forward in small discrete steps. The recurrent backpropagation network and the Spatiotemporal Pattern Recognizer Neural Network (SPRNN) are other examples of spatiotemporal neural networks. The spatiotemporal neural network can effectively store much more information than most other types of neural networks with the same number of nodes. The presented approach is suited to machine maintenace for two reasons: it can model temporal relations, for example, it can describe the development of the symptoms of faults; and it can efficiently handle large amounts of data. Because the spectral signatures of faults may change significantly depending on environmental operating and physical conditions, the amount of training information is very large. ESA

Hazardous operations which in the past have been completed by technicians are under increased scrutiny due to high costs and low productivity associated with providing protective clothing and environments. As a result, remote systems are needed to accomplish many hazardous materials handling tasks such as the clean up of waste sites in which the exposure of personnel to radiation, chemical, explosive, and other hazardous constituents is unacceptable. Traditional remote manual operations have proven to have very low productivity when compared with unencumbered humans. Computer models augmented by sensing and structured, modular computing environments are proving to be effective in automating many unstructured hazardous tasks. DOE

THE PLANNING COORDINATOR: A DESIGN ARCHITECTURE FOR AUTONOMOUS ERROR RECOVERY AND ON-LINE PLANNING OF INTELLIGENT TASKS
Jeffrey J. Farah Dec. 1992 132 p
(Grant NAGw-1333)
(NASA-CR-193250; NAS 1.26:193250; CIRSSE-134) Avail: CASI HC A07/MF A02

Developing a robust, task level, error recovery and on-line planning architecture is an open research area. There is previously published work on both error recovery and on-line planning; however, none incorporates error recovery and on-line planning into one integrated platform. The integration of these two functionalities requires an architecture that possesses the following characteristics. The architecture must provide for the inclusion of new information without the destruction of existing information. The architecture must provide for the relating of pieces of information, old and new, to one another in a non-trivial rather than trivial manner (e.g., object one is related to object two under the following constraints, versus, yes, they are related; no, they are not related). Finally, the architecture must be not only a stand alone architecture, but also one that can be easily integrated as a supplement to some existing architecture. This thesis proposal addresses architectural development. Its intent is to integrate error recovery and on-line planning onto a single, integrated, multi-processor platform. This intelligent x-autonomous platform, called the Planning Coordinator, will be used initially to supplement existing x-autonomous systems and eventually replace them. Derived from text

SOME RESULTS ON FEEDBACK STABILIZATION OF A ONE-LINK FLEXIBLE ARM
Sylvie Icart (I3S-LASSY, Valbonne, France.), Juliette Leblond, and Claude Samson May 1992 30 p
(INRIA-RR-1682; ETN-93-93903) Avail: CASI HC A03/MF A01

A report aimed at exhibiting a class of stabilizing feedback laws for a structurally undamped one link flexible arm with control applied at one extremity is presented. A finite dimensional model of the arm, corresponding to a discretization in space, is first considered. The arm is then modeled by a classical partial differential equation, no finite dimensional approximation being made in the control analysis. In both cases, stability of the closed loop system is proven, using a Lyapunov method and applying Lasalle's principle. The practical significance of the proposed results is commented upon and illustrated by simulation experiments. ESA

A VIDEO TRANSMISSION SYSTEM FOR LOW-BANDWIDTH REMOTE DRIVING
F. W. DePiero, T. E. Noell, and T. F. Gee (Georgia Inst. of Tech., Atlanta.) 1993 6 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-010275; CONF-930403-40) Avail: CASI HC A02/MF A01

Oak Ridge National Laboratory (ORNL) staff have developed a real-time video transmission system for low-bandwidth remote operations. The system supports both continuous transmission of video for remote driving and progressive transmission of still images. Inherent in the system design is a spatiotemporal limitation to the effects of channel errors. The average data rate of the system is 64,000 bits/s, a compression of approximately 1000:1 for the black-and-white National Television Standard Code video. The image quality of the transmissions is maintained at a level that supports the teleoperated driving of a High-Mobility Multipurpose Wheeled Vehicle at speeds of up to 15 mph on a moguled dirt tract. The system also provides video transmissions for a mission package on board the vehicle. The system supports dynamic image quality adjustments that allow the remote driver to adjust to changing scenery and viewing requirements. During driving, the system's nominal configuration had a frame rate of 4 Hz, a compression per frame of 125:1, and a resulting latency of approx. 1s. DOE

(Contract N00014-92-C-0015)
(AD-A264801; SRI-3047) Avail: CASI HC A03/MF A01

The purpose of the FY92/93 effort was to investigate and, where appropriate, develop and deliver software tools to improve the productivity and quality of oceanographic data interpretation. Specifically, this effort comprised three tasks: Task (1) Research and Develop Methods for Improving the Performance of Automated Outlier Detection. Based on algorithms and software developed by SRI under a previous DMA program, several enhancements were carried out. Task (2) Implement, Document, and Deliver the Improved Outlier Detection Algorithms. Additional modifications were made to support generic multibeam format (GMF) data sets. Task (3) Identify and Evaluate More Advanced Oceanographic Data Analysis Tools. A study was made to determine the data automation needs of the oceanographic community, and then compare these needs to data analysis tools already developed for other scientific application areas. Research indicated that a significant body of relevant techniques has indeed been developed for applications such as robotics, image understanding, and various statistical analysis applications. CONTROL OF NONLINEAR SYSTEMS WITH APPLICATIONS TO CONSTRAINED ROBOTS AND SPACECRAFT ATTITUDE STABILIZATION Ph.D. Thesis
Hariharan Krishnan 1992 217 p
Avail: Univ. Microfilms Order No. DA9308365

Control systems described by a class of nonlinear differential and algebraic equations are introduced. A procedure for local stabilization based on a local state realization is developed. An alternative approach to local stabilization is developed based on a classical linearization of the nonlinear differential-algebraic equations. A theoretical framework is established for solving a tracking problem associated with the differential-algebraic system. First, a simple procedure is developed for the design of a feedback control law which ensures, at least locally, that the tracking error in the closed loop system lies within any given bound if the reference inputs are sufficiently slowly varying. Next, by imposing additional assumptions a procedure is developed for the design of a feedback control law which ensures that the tracking error in the closed loop system approaches zero exponentially for reference inputs which are not necessarily slowly varying. The control design methodologies are used for simultaneous force and position control in constrained robot systems. The differential-algebraic equations are shown to characterize the slow dynamics of a certain nonlinear control system in nonstandard singularly perturbed form. The attitude stabilization (reorientation) of a rigid spacecraft using only two control torques is considered. First, the case of momentum wheel actuators is considered. The complete spacecraft dynamics are not controllable. However, the spacecraft dynamics are small time locally controllable in a reduced sense. The reduced spacecraft dynamics cannot be asymptotically stabilized using continuous feedback, but a discontinuous feedback control strategy is constructed. Next, the case of gas jet actuators is considered. If the uncontrolled principal axis is not an axis of symmetry, the complete spacecraft dynamics are small time locally controllable. However, the spacecraft attitude cannot be asymptotically stabilized using continuous feedback, but a discontinuous stabilizing feedback control strategy is constructed. If the uncontrolled principal axis is an axis of symmetry, the complete spacecraft dynamics cannot be stabilized. However, the spacecraft dynamics are small time locally controllable in a reduced sense. The reduced spacecraft dynamics cannot be asymptotically stabilized using continuous feedback, but again a discontinuous feedback control strategy is constructed. Dissert. Abstr.

ADAPTIVE MOTION CONTROL OF MOBILE ROBOTS Ph.D. Thesis
Liqiang Feng 1992 172 p
Avail: Univ. Microfilms Order No. DA9308310

Three topics related to mobile robot motion control are discussed. A hybrid opto-electronic processor is developed to provide the absolute robot motion information. A cross-coupling controller is used to coordinate the motion of different control loops. An adaptive motion controller is used to compensate for the external motion errors. A method that determines the absolute position of a mobile robot with a hybrid opto-electronic processor was developed. Position estimates are based on an analysis of circular landmarks that are detected by a TV camera attached to a mobile robot. For robust operation, the parameters of the landmark image are extracted at high speeds using an optical Hough Transform processor. The coordinates of the mobile robot are then computed. Different sources of position estimation errors were also analyzed, and consequent algorithms to improve the navigation performance of the mobile robot were developed and evaluated by both computer simulation and experiments to provide good performance. Cross-coupling control is used to coordinate the motion of different drive loops, which results in only small position and orientation errors. The cross-coupling controller has excellent disturbance rejection and, therefore, is advantageous when the robot is not loaded symmetrically or travels at high speed. The cross-coupling controller is analyzed and experiments are conducted to evaluate its performance. The experimental results show accuracy improvements over conventional controllers, especially in compensating for orientation error caused by the internal error sources. A model reference adaptive motion controller is designed and built for a differential-drive mobile robot. The controller uses absolute robot motion information to modify the control parameters in real time and, in turn, to compensate for the motion errors. The cross-coupling control method is used to compensate for the internal errors that can be detected by the wheel encoders. The adaptive controller provides compensation for the external errors. The adaptive controller is analyzed, and the stability and convergence are discussed. Both computer simulation and experiments are conducted to evaluate the control system. The results show significant improvements over the conventional controller. Dissert. Abstr.

STRUCTURAL DESIGN USING NEURAL NETWORKS Ph.D. Thesis
Richard Alan Swift 1993 208 p
Avail: Univ. Microfilms Order No. DA9308230

At the early stages of design, it is necessary to obtain an understanding of the design space characteristics for the structural concepts under consideration. This involves developing a representation of the structural system's behavior to variations in the design variables of interest. The effort was to efficiently obtain both qualitative and quantitative structural design space mappings for use in preliminary design studies. Recent advances in finite element based structural optimization techniques provide the means to address this concern, but these approaches typically involve the determination of 'points' in the design space, rather than a mapping of the design space. Neural networks, mathematical models of biologically occurring neural systems, were employed to quantify the design space representations. The neural networks form the representation of the design space based on a set of optimal designs obtained from math-programming and fully-stressed design optimization programs. Feed-forward, back propagation neural networks were used to form the design space representation. The neural network representations were then used to ascertain trends in the design space, and the neural networks were also 'searched' using various optimization procedures to define those regions of the design space that showed the most promising design characteristics. Math-programming techniques and simulated annealing procedures were employed to perform the searches of the design spaces. Recursive learning was explored to minimize the amount of training data necessary (training data generation being the most computationally expensive part of the neural network procedure). Continuous as well as discrete design variables were examined. The continuous design variable cases involved configurations design, while the discrete design variable cases involved material selection. Planar trusses, a 3-D space truss, and three semi-monocoque wings were used to describe the implementation of the neural network procedure. The results obtained from these models show that the design spaces are effectively represented by the neural networks. The neural networks also provide the means to determine significantly improved designs, with reductions in objective function values of over 10 percent noted for several cases. The neural network approach to design space representation appears to hold promise to a wide range of structural design problems.

The role of algebraic topology in geometric modeling is explored, with particular consideration to the uniform handling of both manifold and nonmanifold classes of geometrical objects in the boundary based modeling systems. A conceptual data model is achieved for depicting the structural relationships between the topological entities of geometrical objects. A set of basic operators is constructed to uniquely define these relationships, so that they insulate the application dependent functionalities from the underlying data structure. An underlying data structure for storing the complex boundary and adjacency relationships between the topological properties is designed. Basic algorithms are created for extracting useful topological properties of geometrical objects from the proposed data structure, such as determination of sectors separated by two oriented surfaces, estimation of a chain of topological primitives between two corners, estimation of the formation of a cyclic succession of surfaces by addition of a new surface, and demonstration of the orientability of an object. An example of implementation of operators, data structure and algorithms in the interactive, geometrical modeller Phoenix designed for graphic data processing, is presented. ESA

POLYGONAL APPROXIMATION OVERVIEWS AND PERSPECTIVES [L'APPROXIMATION POLYGONALE BILANS ET PERSPECTIVES]

Philippe Garnesson and Gerard Giraudon Feb. 1992 61 p In FRENCH
(INRIA-RR-1621; ETN-93-93893) Avail: CASI HC A04/MF A01

Polygonal approximation is the transformation of linked edge point into a sequence of line segments. In computer vision, polygonal approximation is a standard task; it is even unavoidable if geometric characteristics of objects must be considered. Different criteria, sometimes inconsistent within themselves, which are used in polygonal approximation are presented and the field of present methods is reviewed. An approach based on the minimization of an energy along the linked edge points is proposed. This energy is based on the maximum distance between the line segments and the linked edge points and on the sum of these distances. Using many examples, the interest of the appproach is illustrated through objective tests (demonstrating for example invariance in rotation or with a mask) and through subjective tests showing geometric shape preservation (such as angles) and the influence of noise. PACKING OF STEINER TREES: POLYHEDRIC STUDIES AND APPLICATION Ph.D. Thesis [PACKEN VON STEINERBAEUMEN: POLYEDRISCHE STUDIEN UND ANWENDUNG]

Alexander Martin 1992 196 p In GERMAN
(ETN-93-93796) Avail: CASI HC A09/MF A03

A formulation to solve the Steiner tree packing problem, by means of graph theory, linear algebra polyhedra theory, and linear programming is developed. The connectivity problem in very large scale integration design, and plane, Manhattan, and knock knee models are presented. Some algorithms for switch box connectivity, such as multicommodity flows in graphs are proposed. Canonic, facet based, and explicit formulation of arborescence polyhedra were examined. The chosen polyhedron was defined as the convex hull of all incidence vectors of Steiner tree packings of a given instance of the problem. A cutting plane algorithm to solve inequalities for polyhedron facet definition with a branch and cut process was developed. Partitioning procedures were realized to solve the separation problem inequalities. The method was applied to problems for the literature. ESA

DESIGN OF AN ESSENTIALLY NON-OSCILLATORY RECONSTRUCTION PROCEDURE IN FINITE-ELEMENT TYPE MESHES

Remi Abgrall Jan. 1992 51 p
(Contract NAS1-8605)
(INRIA-RR-1584; ETN-93-93844) Avail: CASI HC A04/MF A01

An essentially non oscillatory reconstruction for functions defined on finite element type meshes is designed. Two related problems are studied: the interpolation of possibly unsmooth multivariate functions on arbitary meshes and the reconstruction of a function from its averages in the control volumes surrounding the nodes of the mesh. Concerning the first problem, the behavior of the highest coefficients of two polynomial interpolations of a function that may admit discontinuities of locally regular curves is studied: the Lagrange interpolation and an approximation such that the mean of the polynomial on any control volume is equal to that of the function to be approximated. This enables the best stencil for the approximation to be chosen. The choice of the smallest possible number of stencils is addressed. Concerning the reconstruction problem, two methods were studied: one based on an adaptation of the so called reconstruction via deconvolution method to irregular meshes and one that lies on the approximation on the mean as defined above. The first method is conservative up to a quadrature formula and the second one is exactly conservative. The two methods have the expected order of accuracy, but the second one is much less expensive than the first one. Some numerical examples are given which demonstrate the efficiency of the reconstruction. ESA

AN ALGEBRAIC APPROACH TO THE QUANTIZATION OF CONSTRAINED SYSTEMS: FINITE DIMENSIONAL EXAMPLES Ph.D. Thesis
Ranjeet Shekhar Tate 1992 162 p
Avail: Univ. Microfilms Order No. DA9308943

General relativity has two features in particular, which make it difficult to apply to it existing schemes for the quantization of constrained systems. First, there is no background structure in the theory, which could be used, e.g., to regularize constraint operators, to identify a 'time', or to define an inner product on physical states. Second, in the Ashtekar formulation of general relativity, which is a promising avenue to quantum gravity, the natural variables for quantization are not canonical; and, classically, there are algebraic identities between them. Existing schemes are usually not concerned with such identities. Thus, from the point of view of canonical quantum gravity, it has become imperative to find a framework for quantization which provides a general prescription to find the physical inner product, and is flexible enough to accommodate non-canonical variables. I present an algebraic formulation of the Dirac approach to the quantization of constrained systems. The Dirac quantization program is augmented by a general principle to find the inner product on physical states. Essentially, the Hermiticity conditions on physical operators determine this inner product. I also clarify the role in quantum theory of possible algebraic identities between the elementary variables. I use this approach to quantize various finite dimensional systems. Some of these models test the new aspects of the algebraic framework. Others bear qualitative similarities to general relativity, and may give some insight into the pitfalls lurking in quantum gravity. The previous quantizations of one such model had many surprising features. When this model is quantized using the algebraic program, there is no longer any unexpected behavior. I also construct the complete quantum theory for a previously unsolved relativistic cosmology. All these models indicate that the algebraic formulation provides powerful new tools for quantizations. In (spatially compact) general relativity, the Hamiltonian is constrained to vanish. I present various approaches one can take to obtain an interpretation of the quantum theory of such 'dynamically constrained' systems. I apply some of these ideas to the Bianchi 1 cosmology, and analyze the issue of the initial singularity in quantum theory. Author (revised)

BENCHMARK EIGENVALUE SPECTRUM CALCULATIONS WITH ANISOTROPIC EFFECTS
P. Kohut 1993 6 p Presented at the 4th International Conference on Simulation Methods in Nuclear Engineering, Montreal, Quebec, 2-4 Jun. 1993
(Contract DE-AC02-76CH-00016)
(DE93-006387; BNL-48228; CONF-930651-1) Avail: CASI HC A02/MF A01

Complete eigenvalue spectrum calculations are usually performed for benchmark analysis to compare the accuracy of various approximate methods. In one-speed criticality studies the most accurate methods either rely on analytical techniques (singular eigenfunction) or high order spatial expansion (Carlvik's method). The extension of these techniques to calculate higher order anisotropy is somewhat cumbersome and rarely done in practice. In this paper, a low spatial order technique is examined for its capability to produce accurate benchmark results with higher order of anisotropy. In the past, the use of low order methods were generally discarded for this type of calculation due to the large computer memory and time requirements. With the recent development and availability of greatly improved computing power, these limitations are largely removed and low order spatial approximations may also produce accurate solutions. DOE

UNCERTAINTY REASONING IN EXPERT SYSTEMS Final Technical Report, 1 Sep. 1990 - 31 Mar. 1993
Vladik Kreinovich 31 Mar. 1993 19 p
(Grant NAG9-482)
(NASA-CR-193120; NAS 1.26:193120) Avail: CASI HC A03/MF A01

Intelligent control is a very successful way to transform the expert's knowledge of the type 'if the velocity is big and the distance from the object is small, hit the brakes and decelerate as fast as possible' into an actual control. To apply this transformation, one must choose appropriate methods for reasoning with uncertainty, i.e., one must: (1) choose the representation for words like 'small', 'big'; (2) choose operations corresponding to 'and' and 'or'; (3) choose a method that transforms the resulting uncertain control recommendations into a precise control strategy. The wrong choice can drastically affect the quality of the resulting control, so the problem of choosing the right procedure is very important. From a mathematical viewpoint these choice problems correspond to non-linear optimization and are therefore extremely difficult. In this project, a new mathematical formalism (based on group theory) is developed that allows us to solve the problem of optimal choice and thus: (1) explain why the existing choices are really the best (in some situations); (2) explain a rather mysterious fact that fuzzy control (i.e., control based on the experts' knowledge) is often better than the control by these same experts; and (3) give choice recommendations for the cases when traditional choices do not work. ALPAL is a program which automatically generates code to solve nonlinear partial differential equations and other problems. The ALPAL user specifies the equations to be solved and their numerical methods at a very high level of abstraction. When equations are solved by implicit methods, the solution involves Jacobian matrices. The Matrix Editor is a graphical, interactive tool that lets the ALPAL user specify how the generated code should store matrices and solve linear equations. At the heart of the Matrix Editor lies a set of functions which map between symbolic expressions for different indices which represent a matrix in different ways. This paper discusses how the Matrix Editor constructs these functions. DOE

ABLATION PROBLEMS USING A FINITE CONTROL VOLUME TECHNIQUE
B. F. Blackwell, A. L. Thornton, and R. E. Hogan 1993 8 p Presented at the Moving Boundaries 1993: Computational Modeling of Free and Moving Boundary Problems, Milan, Italy, 23-25 Jun. 1993
(Contract DE-AC04-76DP-00789)
(DE93-009861; SAND-93-0284C; CONF-9306128-1) Avail: CASI HC A02/MF A01

An element based finite control volume procedure is applied to the solution of ablation problems for 2-D axisymmetric geometries. A mesh consisting of four node quadrilateral elements was used. The nodes are allowed to move in response to the surface recession rate. The computational domain is divided into a region with a structured mesh with moving nodes and a region with an unstructured mesh with stationary nodes. The mesh is constrained to move along spines associated with the original mesh. Example problems are presented for the ablation of a realistic nose tip geometry exposed to aerodynamic heating from a uniform free stream environment. DOE

PARAMETRIC LIKELIHOOD INFERENCE FOR RECORD BREAKING PROBLEMS Technical Report
Bradley P. Carlin and Alan E. Gelfand 9 Mar. 1993 28 p
(Contract N00014-92-J-1264)
(AD-A262546; TR-465) Avail: CASI HC A03/MF A01

In this paper we consider the analysis of record breaking datasets, where only observations that exceed the current extreme value are recorded. Examples of application areas leading to data of this type include industrial stress testing, meteorological analysis, sporting and athletic events, and oil and mining surveys. The inherent missing data structure present in such problems leads to likelihood functions that contain possibly high-dimensional integrals, thus rendering traditional maximum likelihood methods difficult or infeasible. Fortunately, we may obtain arbitrarily accurate approximations to the likelihood function by iteratively applying Monte Carlo integration methods. Subiteration using the Gibbs sampler may help to evaluate any multivariate integrals encountered during this process. This approach enables a far more sophisticated set of parametric models than have been applied previously in record breaking contexts. In particular, we illustrate the methodology for a wide array of discrete and continuous distributional settings, and for observations that may be correlated and subject to mean shifts over time. Related issues in model selection and prediction are also addressed. Finally, we present two numerical examples. The first uses a generated dataset exhibiting a high degree of autocorrelation, while the second involves records in the Olympic high jump competition. DTIC

A FUNCTIONAL IMPLEMENTATION OF THE JACOBI EIGEN-SOLVER
A. P. W. Boehm (Colorado State Univ., Fort Collins.) and R. E. Hiromoto 1993 9 p Presented at the Conference on Functional Programming Language and Computer Architectures, Copenhagen, 9-11 Jun. 1993
(Contract W-7405-eng-36; NSF MIP-91-13268)
(DE93-007349; LA-UR-93-298; CONF-9306102-1) Avail: CASI HC A02/MF A01

The systematic development of two implementations of the Jacobi eigen-solver are described and performance results for the MIT/Motorola Monsoon dataflow machine are given. Our study is carried out using MINT, the MIT Monsoon simulator. The design of these implementations follows from the mathematics of the Jacobi method, and not from a translation of an existing sequential code. The functional semantics with respect to array updates, which cause excessive array copying, has lead us to a new implementation of a parallel 'group-rotations' algorithm first described by Sameh. Our version of this algorithm requires O(n(sup 3)) operations, whereas Sameh's original version requires O(n(sup 4)) operations. The implementations are programmed in the language Id, and although Id has non-functional features, the development of our eigen-solvers was restricted to the functional sub-set of the language. DOE

PACKING ODD PATHS
A. Schrijver (Amsterdam Univ., Netherlands.) and P. D. Seymour (Bell Communications Research, Inc., Morristown, NJ.) Apr. 1992 14 p
(CWI-BS-R9207; ETN-93-93247) Copyright Avail: CASI HC A03/MF A01

Let (s,t) be vertices of a graph G, and let each edge e have a 'capacity' c(e) which belongs to the set R(sub +). It is demonstrated that for every k belonging to R(sub +) the following statements are equivalent: there is a 'fractional packing' of value k of the odd s-t paths, so that no edge is used more than its capacity; and for every subgraph Hof G with (s,t) pertaining to V(H) in which there no odd s-t path, summation sign (v belonging to V(H)) summation sign (c(e): e belongs to E(G)-E(H), and e is incident with v) greater than or equal to 2K. MIXED LIMIT THEOREMS FOR PATTERN ANALYSIS
Ulf Grenander and Jayaram Sethuraman Feb. 1993 17 p
(Contract DAAL03-90-G-0103)
(AD-A263735; FSU-R-885; ARO-27868.25-MA) Avail: CASI HC A03/MF A01

Limit theorems are derived for probability measures of random configurations over graphs which are used as prior distributions in pattern theory. For one-dimensional graphs, these limits can be viewed as distributions of certain stochastic processes, while in higher dimensions the limits will in some cases have to be interpreted as belonging to Schwartz distributions. Such limit distributions are easy to use in pattern analysis and greatly reduce the computing effort required in comparison with stochastic relaxation methods. DTIC

COMPUTATION AND GENERALIZATION IN NEURAL NETWORKS Final Report, 1 Jul. 1988 - 30 Jun. 1991
Leon N. Cooper 5 May 1993 4 p
(Contract DAAL03-88-K-0116)
(AD-A263752; ARO-25515.3-LS) Avail: CASI HC A01/MF A01

During this contract period, our research into backward propagation has led to a number of new theoretical and empirical results. We have developed a generalized version of backward propagation. In our generalized network, both gains and synapses are modified by a backward propagation procedure. Synapses are modified in proportion to the negative gradient of the energy with respect to the synaptic weight as in ordinary backward propagation, and gains are modified in proportion to the negative partial derivative with respect to gain. Since the resulting error signals for the gain and synaptic weights are proportional to one another, the computational complexity of our generalized network is comparable to that of the original backward propagation model. A DIFFUSION APPROXIMATION FOR A NETWORK OF RESERVOIRS WITH POWER LAW RELEASE RULE
Peter W. Glynn and John E. Glynn Nov. 1992 21 p
(Contract DAAL03-91-G-0101)
(AD-A263753; SU-TR-92-20; ARO-28809.10-MA-SDI) Avail: CASI HC A03/MF A01

A diffusion approximation for a network of continuous time reservoirs with power law release rules is examined. Under a mild assumption on the inflow processes, we show that for physically reasonable values of the power law constants, the system of processes converges to a multi-dimensional Gaussian diffusion process. We also illustrate how the limiting Gaussian process may be used to compute approximations to the original system of processes. In addition, we study the quality of our approximations by comparing them to results obtained by simulations of the original watershed model. The simulations offer support for the use of the developed approximation. DTIC

CONTINUATION OF: APPLICATIONS OF GAUGE THEORIES TO ENHANCE NUMERICAL SOLUTIONS OF MIXED POTENTIAL INTEGRAL EQUATIONS Final Report
Robert D. Nevels, Chenhong Huang, and Zuoguo Wo 12 Mar. 1993 107 p
(Contract N00012-90-J-1334)
(AD-A263763) Avail: CASI HC A06/MF A02

The intention of this research has been to investigate techniques for solving Maxwell's equations under scattering, radiation, and propagation conditions by adapting methods recently developed in mathematical physics. During the first few months of this contract we continued the work begun during the previous three years concerning the possibility of substituting the Coulomb gauge for the standard Lorentz gauge in mixed potential integral equation formulations. In this report, we present our investigations concerning conduction current invariance under gauge transformation and the implementation of the Coulomb gauge in time domain integral equation analysis. Although it is widely known that the electromagnetic field is invariant under a gauge transformation, to the authors' knowledge no previous proof existed showing current invariance. DTIC

A MULTILEVEL APPROACH TO MINIMUM COST NETWORK FLOWS M.S. Thesis
Kevin J. Cavanaugh Sep. 1992 104 p
(AD-A264008) Avail: CASI HC A06/MF A02

Multigrid/multilevel techniques were originally developed for numerically solving partial differential equations. The application of multilevel techniques to a non-geometric long transportation problem is explored. An introduction to multigrid is given, and specifics of how it is applied to this minimum cost network flow problem are explored. This research shows that multilevel techniques can be applied to network optimization problems. Further, since a previous restriction is removed by transferring the problem from a physical space to a cost space, the techniques can be applied to a broader range of problems. Both a multilevel V-cycle and a Full Multigrid (FMG) algorithm are implemented. Various strategies for restriction and local relaxation are discussed, and comparisons between the methods are made. Directions for future work include investigation of graph theoretic aspects of the problems, implementation of a regular grid overlay of the domain, exploration of a fast adaptive composite (FAC) grid algorithm, and development of a full approximation scheme (FAS) algorithm. ADVANCES IN THE IDENTIFICATION OF ELECTROCHEMICAL TRANSFER FUNCTION MODELS USING PRONY ANALYSIS
D. J. Trudnowski, M. K. Donnelly (Control Technology, Inc., Bozeman, MT.), and J. F. Hauer (Bonneville Power Administration, Portland, OR.) Feb. 1993 7 p Presented at the IEEE Winter Power Meeting, Columbus, OH, Feb. 1993
(Contract DE-AC06-76RL-01830)
(DE93-009424; PNL-SA-21265; CONF-930279-2) Avail: CASI HC A02/MF A01

The usefulness and understanding of Prony analysis as a tool for identification of power system electromechanical oscillation models is further advanced. These linear models are developed by analyzing power system ring-down data. The presented results allow more generality in the assumed model formulation. In addition, a comparison is made between Prony analysis and autoregressive moving-average (KARMA) modeling, which was also proposed for analysis of system oscillations. Under the conditions investigated, the Prony algorithm performed more accurate identification. DOE

ON HIGH RESOLUTION EXTENSIONS OF LAGRANGE-GALERKIN FINITE-ELEMENT SCHEMES
Alain Dervieux, Loula Fezoui, and Francoise Loriot (Simulog, Valbonne, France.) Jun. 1992 16 p
(INRIA-RR-1703; ETN-93-93911) Avail: CASI HC A03/MF A01

A study showing how two typical one dimensional finite volume high resolution schemes, like FCT (Flux Corrected Transport) or MUSCL can be introduced in the multidimensional background of a class of Lagrange-Galerkin finite element methods, is presented. For the sake of simplicity, bidimensional spatial discretization is considered, although most of the ideas presented can be extended to three dimensions. Schemes that apply to a class of partial differential equations involving, as in compressible CFD (Computational Fluid Dynamics) for instance, hyperbolic terms and parabolic (diffusion) terms, are concerned. The presented schemes are concluded to enjoy many of the interesting properties of their ingredients: easy and rational derivation of first and second derivatives, on possibly heterogeneous meshes (triangles combined with quadrilaterals), relaxing the constraint of node by node consistency through a variational point of view; positiveness preservation (at least for first order Godunov and scalar FCT) and, more generally, stabilization terms allowing discontinuity capturing (high Mach) and collocated meshes without spurious pressure nodes. DIFFERENCE METHODS FOR HYPERBOLIC PROBLEMS WITH EMPHASIS ON SPACE-CENTERED APPROXIMATIONS
Alain Lerat 1990 92 p Presented at VKI Lecture Series 1990-1993 on Computational Fluid Dynamics, Rhode Saint Genese, Belgium, 5-9 Mar. 1990 Previously announced as N90-27998
(ONERA-NT-1990-4; ETN-93-93724) Avail: CASI HC A05/MF A01

A general framework for the approximation of hyperbolic systems of conservation laws in one space dimension by explicit or implicit two level difference schemes is proposed. Under few natural assumptions, a general scheme is constructed. Its order of accuracy is characterized and a linear analysis is developed to obtain necessary and sufficient conditions for solvability, L(sub 2) stability, dissipation in the sense of Kreiss and good numerical solution of the algebraic systems associated to implicit approximations. A nonlinear analysis concerning the TVD property for a single conservation law and results on the discrete entropy inequality for systems is also presented. Various examples of schemes (mostly centered) are analyzed. These examples show that the general framework is useful to study a particular approximation easily or to systematically determine a new scheme satisfying some properties given in advance. ESA

EXTRACTING INFINITE SYSTEM PROPERTIES FROM FINITE SIZE CLUSTERS: PHASE RANDOMIZATION/BOUNDARY CONDITION AVERAGING
J. T. Gammel, D. K. Campbell, and E. Y. Loh, Jr. Mar. 1993 7 p
(AD-A264712) Avail: CASI HC A02/MF A01

When electron-electron correlations are important, it is often necessary to use exact numerical methods, such as Lanczos diagonalization, to study the full many-body Hamiltonian. Unfortunately, such exact diagonalization methods are restricted to small system sizes. We show that if the Hubbard U term is replaced by a periodic Hubbard term, the full many body Hamiltonian may be exactly solved, even for very large systems, though for low fillings. However, for half-filled systems and large U, this approach is not only no longer exact, it no longer improves extrapolation to larger systems. We discuss how generalized randomized variable averaging (RVA) or phase randomization schemes can be reliably employed to improve extrapolation to large system sizes in this regime. This general approach can be combined with any many-body method and is thus of broad interest and applicability. DTIC

ON THE METHOD OF DETERMINING RELATIONS [O METODE OPREDEIYAYUSHCHIKH SOOTNOSHENIJ]
V. K. Melnikov 1991 8 p In RUSSIAN Presented at the 7th Conference on Nonlinear Evolution Equations and Dynamic Systems, Italy, Jun. 1991
(DE93-606041; JINR-R-2-91-403) Avail: CASI HC A02/MF A01 (US Sales Only)

It is shown that a multicomponent nonlinear Schroedinger equation with a source can be derived by the method of determining relations thus making it possible to apply the inverse scattering method to analyze this equation. However, the system of evolution equations for the scattering data turned out to be nonlinear. An operator relation of the Lax type is also derived which holds due to this equation. However, this operator relation does not uniquely determine this equation and does not guarantee independence of time of the discrete spectrum of the corresponding linear operator. DOE

POSITIVE ENERGY REPRESENTATIONS OF THE CONFORMAL QUANTUM ALGEBRA
L. Dabrowski (International School for Advanced Studies, Trieste, Italy.), V. K. Dobrev (International School for Advanced Studies, Trieste, Italy.), V. Husain, and R. Floreanini (Istituto Nazionale di Fisica Nucleare, Trieste, Italy.) Jul. 1992 13 p
(DE93-606064; IC-92/187; SISSA-137/92/FM; UTS-DFT-22-92) Avail: CASI HC A03/MF A01 (US Sales Only)

The positive-energy unitary irreducible representations of the q-deformed conformal algebra delta-C(sub q) = U(sub q)(su(2,2)) are obtained by appropriate deformation of the classical ones. When the deformation parameter q is Nth root of unity, all these unitary representations become finite-dimensional. For this case we discuss in some detail the massless representations, which are also irreducible representations of the q-deformed Poincare subalgebra of delta-C(sub q). Generically, their dimensions are smaller than the corresponding finite-dimensional non-unitary representation of su(2,2), except when N = 2 module h + 1, where h is the helicity of the representations. The latter cases include the fundamental representations with h = (+-)1/2. DOE

CONNECTIONS BETWEEN QUANTIZED AFFINE ALGEBRAS AND SUPERALGEBRAS
R. B. Zhang Aug. 1992 12 p
(DE93-606065; IC-92/190) Avail: CASI HC A03/MF A01 (US Sales Only)

Every affine superalgebra with a symmetrizable Cartan matrix is closely related to an ordinary affine algebra with the same Cartan matrix. It is shown that the quantum supergroup associated with the former is essentially isomorphic to the quantum group associated with the latter in an appropriate class of representations. At the classical level, each integrable irreducible highest weight representation of the affine superalgebra has a corresponding irreducible representation of the affine algebra, which has the same weight space decomposition. SOME QUALITATIVE PROPERTIES IN POLLING SYSTEMS
Eitan Altman, Panagiotis Konstantopoulos, and Zhen Liu Feb. 1992 32 p
(INRIA-RR-1596; ETN-93-93886) Avail: CASI HC A03/MF A01

A polling system with K greater than or equal to 1 queues and a single server that visits the queues in a cyclic order is considered. The polling discipline in each queue is of general gated type or exhaustive type. It is assumed that in each queue the arrival times form a Poisson process, and that the service times, the walking times as well as the set-up times form sequences of independent and identically distributed random variables. For such a system, sufficient conditions under which the vector of queue lengths is stable are provided. Several criterions for stability are treated: the ergodicity of the process, the geometric ergodicity, and the geometric rate of convergence of the first moment. The ergodicity implies the weak convergence of station times, intervisit times and cycle times. The queue lengths, station times, intervisit times and cycle times are shown to be stochastically increasing in arrival rates, in service times, in walking and in set-up times. The stability conditions and the stochastic monotonicity results are extended to the polling systems with additional customer routing between the queues, as well as bulk and correlated arrivals. For polling systems with mixed limited, gated and exhaustive service disciplines and without set up times, the weighted sum of mean waiting times is proved to increase in the arrival rate, in the first and second moments of the service times and in the variances of the walking times. The monotonicity also holds with respect to the mean walking times if they are deterministic or if there are 'many queues' or the system is heavily loaded. The mean cycle time, the mean intervisit time and the mean station times are proved to be invariant under general service disciplines and general stationary arrival and service processes. ESA

FLOW CONTROL USING THE THEORY OF ZERO SUM MARKOV GAMES

Eitan Altman Feb. 1992 19 p Sponsored by Chateaubriand Fellowship, Israel

(INRIA-RR-1597; ETN-93-93887) Avail: CASI HC A03/MF A01

The problem of dynamic flow control of arriving packets into an infinite buffer is considered. The service rate may depend on the state of the system, may change in time and is unknown to the controller. Tne goal of the controller is to design an efficient policy which guarantees the best performance under the worst service conditions. The cost is composed of a holding cost, a cost for rejecting customers (packets) and a cost that depends on the quality of the service. The problem is studied in the framework of zero sum Markov games, and a value iteration algorithm is used to solve it. An optimal stationary policy (such that the decisions depend only on the actual number of customers in the queue) is shown to exist: it is of a threshold type, and it uses randomization in at most one state. ESA

ASYMPTOTIC PROPERTIES OF CONSTRAINED MARKOV DECISION PROCESSES

Eitan Altman Feb. 1992 22 p Sponsored by Chateaubriand Fellowship, Israel

(INRIA-RR-1598; ETN-93-93888) Avail: CASI HC A03/MF A01

Several asymptotic properties of constrained Markov Decision Processes (MDP's) with a countable state space are presented. Both the discounted and the expected average cost, with unbounded cost, are addressed. The convergence of finite horizon MDP's to the infinite horizon MDP, convergence of MDP's with a truncated state space to the problem with infinite state space, and convergence of MDP's as the discount factor goes to a limit, are concerned. In all these cases, the convergence of optimal values and policies is established. Based on the optimal policy for the limiting problem, policies which are almost optimal for the other (approximating) problems are constructed. ESA

IMAGE CLASSIFICATION USING MARKOV RANDOM FIELDS WITH TWO NEW RELAXATION METHODS: DETERMINISTIC PSEUDO ANNEALING AND MODIFIED METROPOLIS DYNAMICS

Zoltan Kato, Josiane Zerubia, Marc Berthod, and Jean-Paul Stromboni (Nice Univ., France.) Feb. 1992 20 p

(INRIA-RR-1606; ETN-93-93890) Avail: CASI HC A03/MF A01

Two relaxation techniques are presented: deterministic Pseudo Annealing (DPA) and Modified Metropolis Dynamics (MMD) in order to do image classification using a Markov random field modelization. For the first algorithm (DPA), the a posteriori probability of a tentative labeling is generalized to continuous labeling. The merit function thus defined has the same maxima under constraints yielding probability vectors. Changing these contraints convexifies the merit function. The algorithm solves this unambiguous maximization problem and then tracks down the solution while the original constraints are restored yielding a good even if suboptimal solution to the original labeling assignment problem. The second method (MMD) is a modified version of the Metropolis algorithm: at each iteration the new state is chosen randomly but the decision to accept it is purely deterministic. This is of course also a suboptimal technique which gives faster results than stochastic relaxation. These two methods were implemented on a Connection Machine CM2 and simulation results are shown with a synthetic noisy image and a SPOT image. These results are compared to those obtained with the Metropolis algorithm, the Gibbs sampler and ICM (Iterated Conditional Mode). ESA

MODIFIED GOODNESS-OF-FIT TESTS FOR THE WEIBULL DISTRIBUTION M.S. Thesis

Erol Yucel Mar. 1993 91 p

(AD-A262552; AFIT/GOR/ENS/93M-25) Avail: CASI HC A05/MF A01

This research will produce a new modified Anderson-Darling and W* Goodness of fit statistics for the three parameter Weibull Distribution when all parameters unknown and estimated by Maximum Likelihood-Minimum Distance combination. The critical values for each statistic, sample size and levels 0.20, 0.15, 0.10, 0.05 and 0.01 are produced. The Monte Carlo Simulation used 5000 repetitions for sample sizes of 10, 15, 20, 25, 30, 40, and 50 with the Weibull shape equals to 3, scale equals to 4, and location equals to 10. The power study is made for the same sizes as above with the hypothesized Weibull Distribution against 8 other distributions. DTIC

MODIFIED ANDERSON-DARLING AND CRAMER-VON MISES GOODNESS-OF-FIT TESTS FOR THE NORMAL DISTRIBUTION M.S. Thesis

David A. Gwinn Mar. 1993 92 p

(AD-A262554; AFIT/GOR/ENS/93M-07) Avail: CASI HC A05/MF A01

New techniques for calculating goodness-of-fit statistics for normal distributions with parameters estimated from the sample are investigated. Samples are generated for a Normal(0,1) distribution. Critical values are calculated for five modifications to the Anderson-Darling statistic and five modifications to the Cramer-Von Mises statistic. An extensive power study is done to test the power of the new statistics versus the power of the unmodified statistics. Powers of six of the new statistics show minimal to no improvement; two of the new statistics show a marked decrease in power; two of the new statistics show an overall increase in power over the unmodified statistics. One of these two improved statistics was the obvious better of the two, and it was a modification to the Anderson-Darling statistic. Complete tables of critical values for sample sizes $n=4$ through $n=50$ are included for all Anderson-Darling and Cramer-Von Mises statistics, both modified and unmodified. DTIC

N93-28587# Air Force Inst. of Tech., Wright-Patterson AFB, OH. School of Engineering.

A NEW GOODNESS-OF-FIT TEST FOR THE WEIBULL DISTRIBUTION BASED ON SPACINGS M.S. Thesis

Mark C. Coppa Mar. 1993 115 p

(AD-A262615; AFIT/GST/ENS/93M-02) Avail: CASI HC A06/MF A02

The critical values for a new goodness-of-fit test based on spacings are generated for the Weibull distribution when the shape parameter is known. The critical values are used for testing whether a set of observations follow a Weibull distribution when the scale and location parameters are unknown. A Monte Carlo simulation with 10,000 iterations is used to generate the critical values for sample sizes 5(5)35 at shape parameters k equal to 0.5(0.5)1.5 and for sample sizes 5(5)20 at shape parameters k = 2.0(1.0)4.0. A Monte Carlo power study of the Z* test statistic using 5000 iterations is accomplished using nine alternate distributions H sub A. The power is good to excellent when the null hypothesis H(0) is from a skewed distribution (k less than 2.0). Power results at shape parameters k greater than 2.0 are poor for all sample sizes considered. A comparison is made, at shape parameter 1.0, against the prominent competing goodness-of-fit test statistics. Data is obtained from a prior AFIT thesis by Bush. Results indicate that the Z* test is more powerful than the competition at the available sample sizes of 5, 15 and 25 and alpha levels: 0.05 and 0.01. A relationship between the critical value and the sample size is investigated to allow for greater usage of the test statistic. Satisfactory values of fit are attained with a simple log-linear relationship. DTIC

N93-28760# Air Force Inst. of Tech., Wright-Patterson AFB, OH.

A MODIFIED ANDERSON DARLING GOODNESS-OF-FIT TEST FOR THE GAMMA DISTRIBUTION WITH UNKNOWN SCALE AND LOCATION PARAMETERS M.S. Thesis

Tamer Ozmen 8 Mar. 1993 122 p

(AD-A262486; AFIT/GOR/ENS/93M-24) Avail: CASI HC A06/MF A02

A new modified Anderson-Darling goodness-of-fit test is introduced for the three-parameter Gamma distribution when the location parameter is found by minimum distance estimation and scale parameter by maximum likelihood estimation. Monte Carlo simulation studies were performed to calculate the critical values for A-D test when A-D statistic is minimized. These critical values are then used for testing whether a set of observations follows a Gamma distribution when the scale and location parameters are unspecified and are estimated from the sample. Functional relationship between the critical values of A-D is also examined for each shape parameter by the variables, sample size and significance level. The power study is performed with the hypothesized gamma against alternate distributions. Comparison with the previous study which uses MLEs for location and scale showed that the modified test is better in most cases. DTIC

INFORMATION-THEORETIC PERFORMANCE BOUNDING OF BAYESIAN IDENTIFIERS
S. D. Briles 1993 13 p Presented at the Automatic Object Recognition 3, Society of Photo-Optical Instrumentation Engineers (SPIE) OE/Aerospace Science and Sensing Meeting, Orlando, FL, 11-16 Apr. 1993
(Contract W-7405-eng-36)
(DE93-010705; LA-UR-93-919; CONF-930445-4) Avail: CASI HC A03/MF A01

Statistical target recognition techniques perform well when the 'true' target-signature data are deterministic. If the deterministic nature of the data exists and the probabilistic values of a given problem are known, then identifiers, based on Bayesian estimation theory, have great potential for solving the target identification problem. How well an identifier will perform is usually answered by Monte Carlo simulations or implementation experiments. An alternative to these performance analysis techniques is the use of information theory. Information theory has long been applied to the investigation of data compression, which deals with average distortional measures. The association of Bayes risk with distortion allows for information-theoretic tools to be applied to the statistical target identification problem. The rate-distortion function of data compression can be extended to the Bayes rate-distortion function. Derived from designer-specified risk and identifier structure, the theoretical Bayes rate-distortion function relates mutual information to the identifier performance. Mutual information is determined from the target-signature data used by the identifier and by the nature of the noise imposed upon the data. Computational efforts in determining mutual information values allow for identifier performance bounds to be extracted from the Bayes rate-distortion function. DOE

A MONTE CARLO STUDY OF THE RAW AND NORMAL VARIMAX ROTATION CRITERION IN FACTOR ANALYSIS M.S. Thesis
Willam M. Ibinson 23 Mar. 1993 112 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A262516; AFIT/GOR/ENS/93M-27) Avail: Issuing Activity (Defense Technical Information Center (DTIC)

Factor analysis is a multivariate statistical procedure for analyzing and reducing large data sets. Many factor analysis schemes and techniques are available that lead to strikingly different results from the same data. This research effort used a Monte Carlo approach to investigate the properties of two rotation methods for simple structure, Kaiser's raw and normal varimax criterion. Data sets were developed from a set of contrived experimental factor patterns by multiplying each factor pattern by its transpose to create a covariance matrix. Data sets of multivariate normal deviates were in turn generated from each covariance matrix via the Choleski algorithm. Rotated factor pattern matrices from each data set were compared to their respective experimental factor pattern on the basis of structure, loadings, and eigenvalues. These performance issues are addressed through regression analysis and separate factor analysis in which the grand mean of proposed measures of effectiveness are predicted. These measures of effectiveness include structure matching and root mean square error between the experimental and observed factor patterns. Several methods of characterizing factor pattern complexity and predicting rotation criterion performance are explored. DTIC

A MODIFIED CHI-SQUARED GOODNESS-OF-FIT TEST FOR THE THREE-PARAMETER GAMMA DISTRIBUTION WITH UNKNOWN PARAMETERS M.S. Thesis
Thomas J. Sterle Mar. 1993 61 p
(AD-A262553; AFIT/GOR/ENS/93M-21) Avail: CASI HC A04/MF A01

A modified chi-squared goodness-of-fit test was created for the gamma distribution in the case where all three parameters must be estimated from the sample. Critical values are generated using a Monte Carlo simulation procedure with 5000 repetitions each. Random samples of 8 different sizes are drawn from gamma distributions with shape parameters 1, 1.5, 2.0, and 2.5. The shape, scale, and location parameters were then estimated from each sample, using an iterative technique combining the maximum likelihood and minimum distance methods, enabling computation of the chi-squared statistics and critical values. The same process is used to generate random samples, parameter estimates, and chi-squared statistics from 10 alternate distributions as a check on the power of this chi-squared goodness-of-fit test. The goodness-of-fit tests were executed by comparing the chi-squared statistics from the alternate distributions with the gamma critical values, allowing the power to be calculated against each alternate distribution. ON THE VALUE OF FUNCTION EVALUATION LOCATION INFORMATION IN MONTE CARLO SIMULATION
Thomas J. DiCiccio and Peter W. Glynn Nov. 1992 11 p
(Contract DAAL03-91-G-0101)
(AD-A263662; TR-92-17; ARO-28809.11-MA-SDI) Avail: CASI HC A03/MF A01

The point estimator used in naive Monte Carlo sampling weights all the computed function evaluations equally, and it does not take into account the precise locations at which the function evaluations are made. In this note, we show for one-dimensional integration problems that if the weights are suitably modified to reflect the location information present in the sample, then the convergence rate of the Monte Carlo estimator can be dramatically improved from order n(-1/2) to order n(-2), where the number of function evaluations is computed. EMPIRICAL QUANTILE FUNCTION NONPARAMETRIC INTEGRATED ANALYSES Final Report, 1 Sep. 1989 - 28 Feb. 1993
W. D. Kaigh 1 May 1993 15 p
(Contract DAAL03-89-G-0098)
(AD-A263704; ARO-27159.9-MA-SAH) Avail: CASI HC A03/MF A01

This three-year statistics research project addressed theoretical development, efficiency evaluation, and desktop computer implementation of an integrated nonparametric statistical data analysis approach based on Fourier analytic techniques applied to the empirical quantile function (EQF). New EQF statistical procedures were developed for data smoothing and reduction methods, nonparametric estimation of various functionals associated with the quantile function, composite goodness-of-fit tests for uniform and exponential models with applications to related stochastic processes, and nonparametric analysis of variance rank procedures for analysis of independent samples. These EQF methods exploit discrete Hahn polynomial orthogonal polynomial component representations to produce statistics for significance testing and interval estimation for both omnibus and directional alternative models. Performance evaluations of the proposed techniques included theoretical and Monte Carlo efficiency comparisons as well as numerical applications to challenging data sets. Interactive desktop computer and graphics routines utilizing symbolic programming languages were developed to facilitate implementation of EQF data analysis techniques by statistical users. AN ANALYSIS OF THE GENERALIZED LAMBDA DISTRIBUTION M.S. Thesis
Robert J. Bergevin Mar. 1993 82 p
(AD-A262485; AFIT/GST/ENS/93M-01) Avail: CASI HC A05/MF A01

The Generalized Lambda Distribution (GLD) is a four parameter function that is capable of mimicking the behavior of a wide range of probability density functions (pdfs). Unfortunately, the GLD presently cannot model every possible type of pdf. Since the reasons for this limitation are unknown, this thesis examines several potential problems in an attempt to expand the range of distributions the GLD can mimic. We first present a discussion of the behavior of the algorithm that is used to search for the appropriate GLD parameter values. In particular, we examine the effect of using an unconstrained search to find the parameters subject to a constraint that ensures that the resulting pdf is valid. We also develop a reparameterization of the GLD that creates an unconstrained search region. This does not expand the range of distributions the GLD can mimic. We then use an extensive numerical investigation to examine the set of distributions that can be obtained from combinations of the GLD parameters. This examination allows us to expand the range of pdfs that the GLD can model. We also inspect some pdfs that cannot be modeled using the GLD, as well as present an alternative to the method of moments for determining parameter values, using the concept of L-moments. DTIC

MONTE CARLO SIMULATION OF MAGNITUDE-ANGLE ERROR SOURCES Final Report, Oct. - Nov. 1990
Philip N. Jenkins Feb. 1993 27 p
(AD-A263738; AD-E951985; AMSMI/TR-RD-GC-93-4) Avail: CASI HC A03/MF A01

A common error source in Monte Carlo simulations takes the form of a random magnitude at a random angle. This occurs with winds that may have a random angular misalignment oriented in a random direction. A common way of handling this type of error in Monte Carlo simulations is to obtain the magnitude from a gaussian distribution of zero mean and desired standard deviation and to obtain the direction from a uniform distribution. Another common method of handling this error source is to obtain two values from gaussian distribution with zero mean and equal standard deviation and calculate the magnitude and angle. To fully understand each method, the joint probability distribution functions are derived and shown as three-dimensional plots. Author (DTIC)

(Grant AF-AFOSR-0237-89)
(AD-A264062; AFOSR-93-0312TR) Avail: CASI HC A01/MF A01

The proposal dealt with several statistical inference problems in the context of univariate and multivariate linear models having effects, i.e., fixed effects as well as random effects. Most of the articles that were completed under the grant are on the following topics: (1) improved nonnegative estimation of variance components; (2) exact and/or optimum tests for the fixed effects; and (3) exact and/or optimum tests for variance components. The results have the potential for applications in all areas where the mixed model methodology is used and the applications are highlighted in most of the articles that were written based on the problems in the proposal. The Markov chain simulation method has become a powerful computational method in Bayesian analysis. The success of this method depends on the convergence of the Markov chain to its stationary distribution. Two carefully stated theorems, whose conditions are easy to verify, that establish this convergence are given. Versions of our conditions which are simpler to verify for the Markov chains that arise most commonly in Bayesian analysis are given. DTIC

ESTIMATING THE PARAMETERS OF CHAOTIC MAPS Final Report, Jan. - Apr. 1992
Scott Hayes Feb. 1993 28 p
(AD-A262574; ARL-TR-95) Avail: CASI HC A03/MF A01

The lowest mean square error (LMSE) parameter estimator for a chaotic map (a discrete-time dynamical system) is developed, its implementation is discussed, and the results of computer simulations evaluating its performance are presented. The estimator detects the control parameter of a one-dimensional chaotic map from observations of the output sequence in the presence of additive noise. This type of estimation problem is of interest for finding dynamical models of physical systems from measurements by estimating the return map for a Poincare surface of section in state space. Several common estimators for maps are first described. The Cramer-Rao LMSE bound for estimators of chaotic maps is then computed, and the optimal estimator is developed. It is shown that this estimator is efficient (attains the Cramer-Rao bound) and it converges exponentially to the correct parameter for certain trajectories. Because the estimator becomes impractical to use for very long data sequences, an alternative implementation for long data blocks is also described. The exponentially increasing accuracy of this estimator as a function of sample size indicates that the estimator extracts parameter information at a constant rate, unlike a typical estimator with inverse square root convergence, which has a decaying information rate. The information rate is shown to be given by a parameter entropy function formally similar to the Kolmogorov entropy for maps. The information rate is therefore quantitatively linked to the global chaos of the system through this parameter entropy. DTIC

NONLINEAR REALISATIONS OF OMEGA(1 + INFINITY)
E. Sezgin and K. S. Stelle (Imperial Coll. of Science and Technology, London, England.) Jun. 1992 20 p
(DE92-644721; IC-92/122; Imperial/TP-90-91/21; CTP-TAMU-26/91)
Avail: CASI HC A03/MF A01 (US Sales Only)

The nonlinear scalar-field realization of omega(sub 1 + infinity) symmetry in d = 2 dimensions is studied in analogy to the nonlinear realization of d = 4 conformal symmetry SO(4,2). The omega(sub 1 + infinity) realization is derived from a coset-space construction in which the divisor group is generated by the non-negative modes of the Virasoro algebra, with subsequent application of an infinite set of covariant constraints. The initial doubly-infinite set of Goldstone fields arising in this construction is reduced by the covariant constraints to a singly-infinite set corresponding to the Cartan-subalgebra generators upsilon(sup l)(sub -(l+1)). We derive the transformation rules of this surviving set of fields, finding a triangular structure in which fields transform into themselves or into lower members of the set only. This triangular structure gives rise to finite-component subrealizations, including the standard one for a single scalar. We derive the Maurer-Cartan form and discuss the construction of invariant actions. DOE

A NEW EXACT SOLUTION TO THE CLASSICAL EQUATIONS OF MOTION OF THE RELATIVISTIC STRING WITH MASSIVE ENDS
B. M. Barbashov and A. M. Chervyakov 1991 14 p
(DE92-644736; JINR-E-2-91-118) Avail: CASI HC A03/MF A01 (US Sales Only)

The classical histories of the relativistic string with massive ends in space-time are examined in terms of geometric invariants of both the string world surface and world lines of the point masses at the string ends. In this formulation, the string variables are completely defined by means of the constant curvatures and torsions of the endpoint trajectories which are subjected to a system of differential equations with a delayed argument that incorporates retardation effects of the interaction of two point masses through the string. The well-known example of the rotating straight-line string with massive ends corresponds to a particular solution of this system for the constant torsions. A new exact solution for the periodic torsions of the world trajectories of the massive string ends is found. In this case, the string coordinates are represented in terms of normal elliptic integrals and describe a more intricate motion including its transverse vibrations than rotation of a stretched string in a given plane. DOE

ON THE ENERGY-MOMENTUM TENSORS FOR FIELD THEORIES IN SPACES WITH AFFINE CONNECTION AND METRIC
S. Manoff 1991 16 p
(DE92-644743; JINR-E-2-91-77) Avail: CASI HC A03/MF A01 (US Sales Only)

Generalized covariant Bianchi type identities are obtained and investigated for Lagrangian densities, depending on co- and contravariant tensor fields and their first and second covariant derivatives in spaces with affine connection and metric (L(sub n)-space). The notions of canonical, generalized canonical, symmetric, and variational energy-momentum tensor are introduced and necessary and sufficient conditions for the existence of the symmetric energy-momentum tensor as a local conserved quantity are obtained. DOE

ON THE ENERGY-MOMENTUM TENSORS FOR FIELD THEORIES IN SPACES WITH AFFINE CONNECTION AND METRIC
S. Manoff 1991 15 p
(DE92-644744; JINR-E-2-91-78) Avail: CASI HC A03/MF A01 (US Sales Only)

It is shown that the Euler-Lagrange equations for a material system in L(sub n) space (in accordance with the case in U(sub n)-space in contrast to the case in V(sub n) space) cannot be used as sufficient conditions for the existence of the energy-momentum tensor as a local conserved quantity. The non-equivalent of Belinfante's and Hilbert's symmetric energy-momentum tensor for the general case is considered. It is shown from a more general point of view that Einstein's tensor in the general relativity is equal to the symmetric energy-momentum tensor for the gravitational field. DOE

BELTRAMI PARAMETRIZATION AND GAUGING OF VIRASORO AND w-INFINITY ALGEBRAS
L. Tatar (Academia R. P. R., Cluj.) Jul. 1992 20 p
(DE92-644844; IC-92/126) Avail: CASI HC A03/MF A01 (US Sales Only)

The gauging of the Virasoro and w-infinity algebras are discussed from the point of view of BRST symmetry. Both algebras are realized as 'Russian formulas' for the curvatures built from the generators of the Lie algebras and the corresponding gauge fields. The generalized curvatures are used to determine the gauge invariant Lagrangians as well as the anomaly structures of the conformal two dimensional theory and the w-gravity. DOE

N93-30981# International Centre for Theoretical Physics, Trieste (Italy).
EQUIVARIANT ELLIPTIC HOMOLOGY
J. A. Devoto May 1992 31 p
(DE92-641338; IC-92/72) Avail: CASI HC A03/MF A01 (US Sales Only)

In a previous paper, we studied the modular properties of indices of elliptic operators on twisted loop spaces of manifolds with finite group actions. This motivates the introduction of the universal twisted elliptic genus. This genus can be interpreted as a ring homomorphism from the equivariant bordism ring MU(sub *)(sup G) to a ring Ell(sub *)(sup G). It is shown that the factor X yields Ell(sub *)(sup G) = MU(sub *)(sup G)(X)(x)(sub MU(sub *))(sup G)Ell(sub *)(sup G) defines an equivariant homology theory, and that the associated cohomology theory satisfies a conjecture of Atiyah and Segal about generalized Lefchetz formulas. DOE

NTH ROOTS OF NORMAL CONTRACTIONS
B. P. Duggal Jul. 1992 14 p
(DE92-644725; IC-92/133) Avail: CASI HC A03/MF A01 (US Sales Only)

Given a complex separable Hilbert space H and a contraction A on H such that A(exp n), where n is greater than or equal to 2 some integer, is normal it is shown that if the defect operator D(sub A) = (1 - A(exp *)A)(exp 1/2) is of the Hilbert-Schmidt class, then A is similar to a normal contraction, either A or A(exp 2) is normal, and if A(exp 2) is normal (but A is not) then there is a normal contraction N and a positive definite contraction P of trace class such that (A - N)(sub 1) = 1/2(P + P)(sub 1). If T is a compact contraction such that its characteristic function admits a scalar factor, if T = A(exp n) for some integer n greater than o r equal to 2 and contraction A with simple eigenvalues, and if both T and A satisfy a 'reductive property', then A is a compact normal contraction. DOE

SPHERICALLY SYMMETRIC LINE ELEMENT AND KILLING VECTORS IN FIVE-DIMENSIONAL SPACE
G. Rcheulishvili Jun. 1992 9 p
(DE93-604132; IC-92/108) Avail: CASI HC A02/MF A01 (US Sales Only)

The series of Killing vectors for the line element are described. Their algebras and curvature are presented. The explicit expressions of metrics for higher symmetries are written down. DOE

N93-30989# International Centre for Theoretical Physics, Trieste (Italy).
SUPERCONFORMAL STRUCTURES AND HOLOMORPHIC 1/2-SUPERDIFFERENTIALS ON N = 1 SUPER RIEMANN SURFACES
H. Kachkachi and M. Kachkachi Jul. 1992 15 p
(DE93-604133; IC-92/146) Avail: CASI HC A03/MF A01 (US Sales Only)

Using the Super Riemann-Roch theorem we give a local expression for a holomorphic 1/2-superdifferential in a superconformal structure parametrized by special isothermal coordinates on an N = 1 Super Riemann Surface (SRS). This construction is done by choosing a suitable origin for these coordinates. The holomorphy of the latter with respect to super Beltrami differentials is proven. DOE

PHYSICS AND MATHEMATICS
29 Apr. 1993 82 p Transl. into ENGLISH from various Russian articles
(JPRS-UPM-93-002) Avail: CASI HC A05/MF A01

Translated abstracts cover the following areas: acoustics, lasers, semiconductors, high temperature physics, magnetohydrodynamics and plasmas, optics, superconductivity, theoretical physics, numerical analysis, control theory, and differential equations. Some specific articles address the following topics: generation and transport of solar cosmic rays (survey); relative locations of a powerful flare, the heliospheric current sheet, and the earth fostering the onset of a strong geomagnetic storm; quiet and disturbed heliospheric streamers near earth; effect of vibrationally excited nitrogen on the formation of the main ionospheric trough of electron density in the ionospheric F region; effects of chemical modification of the ionosphere from shortwave doppler measurements over oblique radio communication lines; observation of electromagnetic VLF radiation of seismic origin from Interkosmos-24; anisotropy of electron distribution in ultrastrong microwave field; and effect of a rapid increase in plasma concentration on the propagation dynamics of an electromagnetic wave through it. For the first time, the lift, drag, and guidance forces acting on a permanent magnet are measured as the magnet passes over different arrays of figure-eight (null-flux) coils. The experimental results are in good agreement with the predictions of dynamic circuit theory, which is used to explain more optimal coil arrays. DOE

DYNAMICS AND PHOTOEXCITATION IN MX AND MXX' CHAIN SOLIDS
J. T. Gammel, A. Saxena, and A. R. Bishop Mar. 1993 6 p
(AD-A264823) Avail: CASI HC A02/MF A01

Nonlinear adiabatic dynamics associated with nonlinear excitations in MX and MXX chain materials are numerically studied within a discrete, 3/4-filled, two-band, tight-binding extended Peierls-Hubbard model. Both Hartree-Fock (HF) adiabatic molecular relaxation and molecular dynamics techniques are employed to investigate the time evolution of solitons, polarons, bipolarons in charge-density wave (CDW), bond order wave (BOW), and spin-density-wave (SDW) ground state materials. Photoexcitations are performed between (1) continuum levels, (2) localized levels, and (3) continuum and localized level. The subsequent formation and time evolution of excitons, defect pairs, breathers, and, for the MXX solids, charge separations are studied in terms of energy levels and distortion patterns. These results are compared with the dynamics of previously studied 1/2-filled, one band, SSH-type electron-photon models, used for studying polyenes and polyynes, and experimental data. DTIC

THE ROAD TO ROOM TEMPERATURE SUPERCONDUCTIVITY WORKSHOP Final Report, 15 Oct. 1992 - 14 Jan. 1993
Theodore H. Geballe 14 Jan. 1993 8 p Workshop held in Bodega Bay, CA, 19-21 Oct. 1992
(Contract F49620-93-1-0038)
(AD-A264633; AFOSR-93-0257TR) Avail: CASI HC A02/MF A01

History shows right from the beginning that there has been no successful prediction of new families of superconductors. Discoveries in this field have been unexpected, even revolutionary, and not foreseen as simple and logical next steps in an ongoing scientific enterprise. The Bednorz-Muller discovery of superconductivity in the copper-oxide pervoskite family was just such a revolutionary jump. But evolutionary research aimed at the synthesis and characterization of new compositions can also give insightful and even unexpected results. To this end, a 2-day workshop was recently held in which a diverse group of researchers discussed the possibility of reaching substantially higher transition temperatures than are presently known. SUBJECTIVE RESPONSE TO SIMULATED SONIC BOOMS WITH GROUND REFLECTIONS
B. M. Sullivan (Lockheed Engineering and Sciences Co., Hampton, VA.) and J. D. Leatherwood Jun. 1993 35 p
(RTOP 537-03-21-03)
(NASA-TM-107764; NAS 1.15:107764) Avail: CASI HC A03/MF A01

The Sonic Boom Simulator at NASA LaRC was used for the following: (1) quantify subjective loudness of simulated composite sonic booms, each of which was comprised of a simulated direct (non-reflected) boom combined with a simulated reflection of the direct boom; and (2) evaluate several metrics as estimators of loudness for these composite booms. The direct booms consisted of selected N-wave and minimized signatures having front-shock rise times of 3, 6, and 9 milliseconds and durations of 300 milliseconds. Delay times of the reflected booms ranged from 0 to 12 milliseconds. Subjective loudness results indicated that composite booms formed using reflections with non-zero delay times were generally rated as being less loud than composite booms containing non-delayed reflections. The largest reductions in loudness occurred when delay times were equal to the front shock rise times of the direct booms and were, in some cases, equivalent to reductions in Perceived Level of 6 to 7 dB. Results also showed Perceived Level to be an effective metric for assessing subjective loudness effects for the composite signatures. This was confirmed by statistical analysis, which showed that, for equal Perceived Level, no significant differences existed between the subjective loudness responses to composite booms containing reflections with zero delay and those containing reflections with non-zero delays. A three year study of thermoacoustic engines operating as prime movers and refrigerators was completed. The major thrust of this effort was the use and theoretical description of ceramic honeycomb structures as the active element in thermoacoustic engines. An air-filled demonstration prime mover was constructed and demonstrated at Acoustical Society of America and IEE meetings. A helium-filled test prime mover was designed and built an is being employed in studies of the threshold of oscillation as a function of temperature difference and pressure. In addition, acoustically based theories of the thermoacoustic engine have been developed and tested for a parallel plate stack at the Naval Postgraduate School and for a honeycomb stack at the University of Mississippi. Most of this work is described in detail in the attached publications. In this report we will give an overview of the research completed to date and its relationship to work performed at the Naval Postgraduate School and to future work at the University of Mississippi. ACOUSTIC TRANSDUCER SYSTEM Patent
Edward J. Hilliard, Jr., inventor (to Navy) 16 Feb. 1993 6 p Filed 28 May 1992
(AD-D015713; US-Patent-5,187,690; US-Patent-Appl-SN-892063; US-Patent-Class-367-131) Avail: US Patent and Trademark Office

An acoustic transducer system employs a seawater return cable as a receiver element. The cable is either open ended or short circuited with the seawater. A carrier frequency is applied at one end of the cable. Acoustic-pressure waves impinging the cable, change the characteristic input impedance of the cable. The changes in the impedance amplitude and phase angle are processed to derive information descriptive of the acoustic source. DTIC

INVESTIGATION OF THERMOACOUSTIC MUFFLER M.S. Thesis
Chun-Hua Che Dec. 1992 40 p
(AD-A262009) Avail: CASI HC A03/MF A01

The design, construction, and testing of a thermoacoustic muffler is discussed. The performance of the muffler is characterized by measuring its ability to reduce the quality factor Q of an acoustic resonator. Measurements of the Q of a helium filled muffler were made for temperature differences ranging from 0 to -130 deg C. The measured Q-reduction, approximately 30%, agrees with predicted reductions. The predictions are based on a standing wave analysis of thermoacoustic engines. These results indicate that Q-reduction is possible. Future work should concentrate on optimization, to determine if a thermoacoustic muffler is, in fact, practical. DTIC

FEATURE BASED NEURAL NETWORK ACOUSTIC TRANSIENT SIGNAL CLASSIFICATION M.S. Thesis
Terry S. Wichert Mar. 1993 111 p
(AD-A263437) Avail: CASI HC A06/MF A02

Utilization of neural network techniques to recognize and classify acoustic signals has long been pursued and shows great promise as a robust application of neural network technology. Traditional techniques have proven effective but in some cases are quite computationally intensive, as the sampling rates necessary to capture the transient result in large input vectors and thus large neural networks. This thesis presents an alternative transient classification scheme which considerably reduces neural network size and thus computation time. Parameterization of the acoustic transient to a set of distinct characteristics (e.g., frequency, power spectral density) which capture the structure of the input signal is the key to this new approach. Testing methods and results are presented on networks for which computation time is a fraction of the necessary with traditional methods, yet classification reliability is maintained. Neural network acoustic classification systems utilizing the above techniques are compared to classic time domain classification networks. Lastly, a case study is presented which looks at these techniques applied to the acoustic intercept problem. DTIC

SOUND WAVE SCATTERING FROM AN ELASTIC SPHERICAL SHELL
C. J. Partridge Jan. 1993 54 p
(AD-A264039; MRL-TR-91-10; DODA-AR-006-357) Avail: CASI HC A04/MF A01

The Helmholtz integral equation may be formulated by combining the scalar wave equation and Euler's equation for motion within a fluid. The solution to this integral equation yields the radiated pressure from a submerged vibrating body. The solution obtained from applying Hamilton's variational principle governs the response to a given surface pressure excitation. These two solutions may be used in conjunction to investigate the scattering of incident sound waves from shell-like bodies. In this report, the scattering from a submerged steel spherical shell having a thickness to radius ratio of 0.01 is investigated for ka values up to 8. DTIC

COMPUTATION OF FAR-FIELD HELICOPTER ROTOR TONE NOISE Ph.D. Thesis - Univ. de Tech. de Compiegne, 1985 [CALCUL DU BRUIT DE RAIES EMIS PAR UN ROTOR D'HELICOPTERE EN CHAMP LOINTAIN]
Michel Caplot 1990 236 p In FRENCH
(ONERA-P-1990-5; ETN-93-93722) Avail: CASI HC A11/MF A03

The prediction of helicopter main rotor tone noise in subsonic regime is addressed. A synthesis of the different approaches to this problem is given and a method in the frequency domain is proposed, and compared to a more usual time domain method. For the velocities considered, it appears that the two main tone noise sources are the thickness noise of the monopolar type and the loading noise of the dipolar type. A noise prediction computation code was developed that allows the study of these two sources. For thickness noise, the important factors are the advancing blade and rotational top Mach numbers and the geometric characteristics of the rotor blade. For loading noise, the study is more complicated because the input data are issued from an aerodynamic code. Nevertheless, the use of the frequency method, associated with harmonic analysis of the rotor loads, has real advantages, especially for future developments in the case of blade-vortex interactions. To predict levels under acoustic certification conditions for helicopters, sound wave reflections on the ground and the Doppler effect were introduced in the calculation scheme. ESA

EVALUATION OF THE SCATTERED PRESSURE DUE TO INFINITE RIGID CYLINDERS, INFINITE ELASTIC CYLINDRICAL SHELLS, AND RIGID SPHERES IN THE PRESENCE OF AN AMBIENT NOISE FIELD Final Report, Jan. - Sep. 1992
Rebecca L. Honeycutt and Steven J. Johnson Apr. 1993 64 p
(AD-A264835; CDNSWC-SIG-93/108-745) Avail: CASI HC A04/MF A01

The sound scattering due to an ambient noise field, approximated by a squared cosine function, is considered for infinite rigid and elastic cylinders and rigid spheres. For the cylinders, it is assumed that the acoustic wave front is parallel to the axis of the cylinder (informally incident). For this assumption, a closed form expression for the scattered sound field-to-incident ambient noise field (signal-to-noise) ratio is obtained not only for the cosine squared directivity, but for any arbitrary directivity which can be expressed in terms of a Fourier series. For the sphere, it is assumed that the noise is circumferentially symmetric which leads to a closed form expression for the signal-to-noise ratio due to a cosine squared directivity. DTIC

STRONG PARALLEL BLADE-VORTEX INTERACTION AND NOISE PROPAGATION IN HELICOPTER FLIGHT Ph.D. Thesis
Soogab Lee 1992 152 p
Avail: Univ. Microfilms Order No. DA9309693

Rotor impulsive noise is, of all the known sources of helicopter far-field noise radiation, the one which tends to dominate the acoustic spectrum generated by most helicopters. The helicopter generates a highly directional and rather unique form of impulsive noise which is thought to be generated by two source mechanisms: (1) high-speed impulsive noise due to formation of a shock on the advancing blade tip, and (2) Blade-Vortex Interaction (BVI) noise in low-powered descending flight or maneuvers, especially during an approach to a landing. As an experimental approach, a shock tube was built to generate a compressible viscous vortex which was being convected at a constant velocity in a quasi-uniform subsonic or transonic stream. The vortex then interacted with a target airfoil (NACA 0012 shape). In order to measure quantitatively the flow field, a DPHI (Dual Pulsed Holographic Interferometry) technique was utilized for both flow visualization and density field measurements, and fast-response Kulite transducers were used to obtain pressure histories at the surfaces of both the test section and the airfoil. Secondly, as a numerical approach, the Thin-Layer Navier-Stokes equations were solved not only to simulate the experimental measurements, but also to develop the fundamental understanding of flow field and sound generating mechanisms and, furthermore, to understand the effect of several important parameters on the sound generation due to blade-vortex interaction. The results indicate that the main noise generating mechanism in strong blade-vortex interactions is the severe pressure fluctuation near the leading-edge, caused by rapid oscillation of the stagnation point and formation of a suction peak. In strong parallel BVI, a secondary vortex may be generated by separation on the lower surface if the original vortex is clockwise. In that case, the induced vortex has an opposite rotation. The generated noise level is strongly dependent on Mach number, miss distance, angle of attack, and vortex structure (circulation and core size). The near-field acoustic behavior also depends on the leading-edge shape and thickness of the airfoil rather than the chord length. Results also indicate that transpiration on the leading-edge can suppress pressure fluctuation near the leading-edge and reduce the amplitude of propagating noise. Dissert. Abstr.

From its inception, the Nuclear Data Project at the University of Michigan has concentrated on two major objectives: (1) to carry out carefully controlled nuclear measurements of the highest possible reliability in support of the national nuclear data program, and (2) to provide an educational opportunity for students with interests in experimental nuclear science. The project has undergone a successful transition from a primary dependence on the photoneutron laboratory to one in which current research is entirely based on a unique pulsed 14 MeV fast neutron facility. The new experimental facility is unique in its ability to provide nanosecond bursts of 14 MeV neutrons under conditions that are 'clean' and as scatter-free as possible, and is the only one of its type currently in operation in the United States. It was designed and put into operation primarily by graduate students, and has met or exceeded all of its important initial performance goals. The point of its routine operation has been reached, and most of the data are now in hand that will serve as the basis for the first two doctoral dissertations to be written by participating graduate students. Our initial results on double differential neutron cross sections will be presented at the May 1993 Fusion Reactor Technology Workshop. After investing several years in equipment assembly and optimization, the project has now entered its 'data production' phase. DOE

SPIN OBSERVABLES IN LARGE t ELASTIC N-N SCATTERING
G. P. Ramsey 11 Jan. 1993 13 p Presented at the 10th International Symposium on High-Energy Spin Physics, Nagoya, Japan, 9-14 Nov. 1992
(Contract W-31-109-eng-38)
(DE93-009211; ANL-HEP-CP-93-02; CONF-921131-8) Avail: CASI HC A03/MF A01

Model amplitudes for pp yields pp elastic scattering in the intermediate hard scattering kinematic regime: m(sub p)(sup 2) much less than absolute value of t much less than s are presented, and they are applied to the calculation of spin observables. In this region, the t-dependent Landshoff amplitudes have a significant contribution to the spin observables. Helicity non-conserving effects may also play a major role in this regime. Specific quantum chromodynamics (QCD) motivated predictions for the spin observables can be tested at polarized proton beam facilities. A program is suggested for elastic polarized proton scattering experiments in this kinematic region, which can be used to test the foundations of exclusive QCD. DOE

(AD-A263271) Avail: CASI HC A07/MF A02

The need to pack more power with less weight into less space in tomorrow's weapons drove this program for the synthesis of super energetic materials. Our original impetus was a program based solely on the energetic properties of cubane. However, in the course of our studies here and in a parallel ONR sponsored program, we discovered and developed an alternative oxidizer to cubyl based systems, the dinitramide salts. We will report on our developments in the synthesis of new oxidizers based on cubane and dinitramide. In this research, we developed new methods for the functionalization of the cubane nucleus and synthesized new energetic cubanes. We developed several new routes for the synthesis of the dinitramino group. Our work on the preparation of the dinitramide group led to the synthesis of the dinitramide ion, and as a consequence ammonium dinitramide. We have in turn used this synthesis to prepare cubane ammonium dinitramide salts. We synthesized cubane-1,4bis-(ammonium dinitramide) and cubane1,2,4,7-tetrakis(ammonium dinitramide) as well as several other dinitramide salts. DTIC

EXOTIC ATOMS
R. Kunselman 1993 12 p
(Contract DE-FG02-87ER-40333)
(DE93-010242; DOE/ER-40333/133; COO-2197-133) Avail: CASI HC A03/MF A01

The experiments use a solid hydrogen layer to form muonic hydrogen isotopes that escape into vacuum. The method relies on transfer of the muon from protium to either a deuteron or a triton. The resulting muonic deuterium or muonic tritium will not immediately thermalize because of the very low elastic cross sections, and may be emitted from the surface of the layer. Measurements which detect decay electrons, muonic x-rays, and fusion products were used to study the processes. A target was constructed which exploits muonic atom emission in order to learn more about the energy dependence of transfer and muon molecular formation. DOE

Infrared-optical double resonance is being used to study the unimolecular dissociation dynamics of hydrazoic acid (HN3). The 6(nu)(sub NH) vibrational overtone excitation spectra are given for HN3. Work was begun to determine the feasibility of extending the infrared-optical double resonance photofragment spectroscopy to small free radicals, and to be able to monitor atomic dissociation fragments via laser induced fluorescence in the VUV spectrum. DOE

THE PRODUCTION AND DESTRUCTION OF NEGATIVE IONS
D. J. Pegg 1993 12 p
(Contract DE-FG05-85ER-13456)
(DE93-010527; DOE/ER-13456/47) Avail: CASI HC A03/MF A01

Single photon absorption-single electron detachment from few-electron atomic negative ions was studied. A crossed beam apparatus is being used to perform energy- and angle-resolved photoelectron spectroscopic measurements following photodetachment. Forward-directed electrons were collected and energy analyzed. The kinetic energies and yields of the photoelectrons were obtained by fitting the spectral peaks to Gaussian functions. Electron affinities, asymmetry parameters, and cross sections are determined from these measurements. A ratio method in which the cross section for the ion of interest is measured relative to that of a reference ion was used. The study of the photodetachment of Li(-) was completed, and attention has turned to the photodetachment of the stable ion B(-) and the metastable ion Be(-). DOE

STUDIES OF RELATIVISTIC HEAVY ION COLLISIONS AT THE AGS (E814/E877)
W. E. Cleland 1993 45 p
(Contract DE-FG02-87ER-40363)
(DE93-008541; DOE/ER-40363/6) Avail: CASI HC A03/MF A01

Efforts have continued in the area of peripheral and central collisions of relativistic heavy ions. In the area of peripheral collisions, the analysis of the 1n and 2p decay channels has been completed. In the area of central collisions, the first measurement of the E(sub T) distributions in Au + Au collisions, through the use of the participant calorimeter, was completed, and the results were compared with those obtained in collisions with Si projectiles. In addition, a thorough study of two-particle correlation functions was carried out by use of the data from the silicon pad multiplicity detector. Differential cross sections for 14.6-GeV/c Si-28 on Al, Cu, and Pb, and 11.4-GeV/c Au-197 on Al, Cu, Au, and Pb are given. DOE

MESON-MESON INTERACTIONS AND PHI-ENHANCEMENT IN NUCLEUS COLLISIONS
M. Berenguer, H. Sorge, H. Stoecker (Johann-Wolfgang-Goethe-Univ., Frankfurt am Main, Germany.), and W. Greiner (Johann-Wolfgang-Goethe-Univ., Frankfurt am Main, Germany.) 1993 7 p Presented at the 9th Winter Workshop on Nuclear Dynamics, Key West, FL, 30 Jan. - 6 Feb. 1993
(Contract W-7405-eng-36)
(DE93-010725; LA-UR-93-1003; CONF-930197-1) Avail: CASI HC A02/MF A01

We present a novel approach for interactions between pseudoscalar and vector mesons. The parameters of the model are adjusted to pion-pion and pion-kaon data. The obtained cross sections are implemented into the Monte Carlo Code RQMD (Relativistic Quantum Molecular Dynamics) for heavy ion collisions. Phi production for S on U and pp collisions at 200 AGeV is calculated. A factor of 2 enhancement for the ratio (Phi/(w plus p))su/(Phi/(w plus p))(sub pp) is found in central AA collisions. DOE

COMPARISON OF ANALYTICAL TRANSPORT AND STOCHASTIC SOLUTIONS FOR NEUTRON SLOWING DOWN IN AN INFINITE MEDIUM
S. N. Jahshan, C. A. Wemple, and B. D. Ganapol (Arizona Univ., Tucson.) 1993 10 p Presented at the International Topical Meeting on Mathematical Methods and Supercomputing in Nuclear Applications (M/C+SNA 1993), Karlsruhe, Germany, 19-23 Apr. 1993
(Contract DE-AC07-76ID-01570)
(DE93-010799; EGG-M-92468; CONF-930404-8) Avail: CASI HC A02/MF A01

A comparison of the numerical solutions of the transport equation describing the steady neutron slowing down in an infinite medium with constant cross sections is made with stochastic solutions obtained from tracking successive neutron histories in the same medium. The transport equation solution is obtained using a numerical Laplace transform inversion algorithm. The basis for the algorithm is an evaluation of the Bromwich integral without analytical continuation. Neither the transport nor the stochastic solution is limited in the number of scattering species allowed. The medium may contain an absorption component as well. DOE

SPIN DEPENDENT PHENOMENA IN MEDIUM ENERGY PHYSICS
P. A. Souder Nov. 1992 42 p
(Contract DE-FG02-84ER-40146)
(DE93-010972; DOE/ER-40146/4) Avail: CASI HC A03/MF A01

The Syracuse University Medium Energy Physics Group was actively engaged in several research projects. A laser was used to polarize muonic atoms with the goal of measuring fundamental spin-dependent parameters in the reaction mu(-) + He-3 yields H-3 + nu. Time-averaged polarizations of 26.8 +/- 2.3% were achieved for the muon in muonic He-3. The new approach uses atomic spin-dependent reactions between laser polarized Rb vapor and muonic helium. To exploit these high polarizations in a muon capture experiment, we are developing an ion chamber which will detect the recoil tritons and also serve as a polarizing cell. Final data-taking will begin for an experiment to measure the spin-dependent structure functions of the neutron. A 288-element hodoscope system which features good timing and precise mechanical tolerances was constructed and evaluated. DOE

THE PHOTODISSOCIATION AND REACTION DYNAMICS OF VIBRATIONALLY EXCITED MOLECULES
1993 9 p
(Contract DE-FG02-86ER-13500)
(DE93-010896; DOE/ER-13500/T3) Avail: CASI HC A02/MF A01

We have used combined vibrational overtone excitation and laser induced fluorescence detection to study dissociation dynamics of hydroxylamine (NH2OH), have performed our first laser induced grating experiments on water, and have begun assembling a new apparatus for preparing vibrationally excited molecules with simulated Raman excitation. We study role of vibrational excitation in photodissociation dynamics by using a vibrational state preparation technique, such as vibrational overtone excitation or stimulated Raman excitation, to create molecules with particular nuclear motions and then to excite that molecule to a dissociative electronic state. DOE

QUANTUM DYNAMICS OF X2BC VAN DER WAALS CLUSTERS
S. K. Gray 1992 11 p Presented at the International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract W-31-109-eng-38)
(DE93-006416; ANL/CHM/CP-78499; CONF-930159-4) Avail: CASI HC A03/MF A01

Wave packet calculations modeling vibrational predissociation in X(2)BC(v(')) van der Waals clusters are discussed. A model involving three active degrees of freedom is used. Cluster lifetimes and BC vibrational product distributions are obtained, and compared with available experimental results for He2Cl2, and Ne2Cl2. Some preliminary results for He2I2 and Ne2I2 are also discussed. Mechanistic issues, including the role of direct versus sequential mechanisms in leading to the production of 2X + BC are addressed, as well as the role of intramolecular vibrational relaxation (IVR). Higher dimension extensions of the model are suggested. DOE

COHERENT AND SEMI-COHERENT NEUTRON TRANSFER REACTIONS
P. L. Hagelstein 1992 10 p Presented at the ICCF3 Conference, Nagoya, Japan, Oct. 1992
(Contract DE-FG02-89ER-14012)
(DE93-008336; CONF-9210321-1) Avail: CASI HC A02/MF A01

Neutron transfer reactions are proposed to account for anomalies reported in Pons-Fleischmann experiments. The prototypical reaction involves the transfer of a neutron (mediated by low frequency electric or magnetic fields) from a donor nucleus to virtual continuum states, followed by the capture of the virtual neutron by an acceptor nucleus. In this work, we summarize basic principles, recent results, and the ultimate goals of the theoretical effort. DOE

RESEARCH IN THEORETICAL NUCLEAR PHYSICS
2 Mar. 1993 9 p
(Contract DE-FG02-87ER-40328)
(DE93-008380; DOE/ER-40328/1) Avail: CASI HC A02/MF A01

Research in progress and plans for future investigations are briefly summarized for the following areas: light-ion structure and reactions; nuclear structure; peripheral heavy-ion reactions at medium and high energy; medium-energy heavy-ion collisions and properties of highly excited nuclear matter; and high-energy heavy-ion collisions and QCD plasma. DOE

N93-29099# Lawrence Livermore National Lab., CA.
ION MOTION EFFECTS ON CHARGED RADIATORS
D. B. Boercker Jun. 1992 17 p Presented at the 11th International Conference on Spectra Line Shapes, Carry Le Rouet, France, 8-12 Jun. 1992
(Contract W-7405-eng-48)
(DE93-009257; UCRL-JC-110949; CONF-9206255-2) Avail: CASI HC A03/MF A01

Stark broadening of plasma line radiation results from the interaction of the internal degrees of freedom of the radiators with the electric microfields produced by the plasma. For the case of a charged radiator, the microfield is also responsible for the acceleration of the center-of-mass through its interaction with the net charge. This relationship between the radiative and transport properties of charged radiators has been exploited to obtain an accurate and practical description of ion motion effects on line shapes from simple, hydrogenic ions. In this paper, this model will be extended to include the edicts of fine structure in hydrogen. Comparisons with computer simulation results are also made. DOE

THEORETICAL HYPERFINE STRUCTURE CONSTANTS FOR TRANSITION METAL ATOMS AND IONS
D. R. Beck 23 Mar. 1993 3 p
(Contract DE-FG02-92ER-14282)
(DE93-012325; DOE/ER-14282/1) Avail: CASI HC A01/MF A01

Accurate calculation of hyperfine structure of (d+s)(sup n) states involves dealing with both relativistic and correlation effects in a multi-reference framework (all (d+s)(sup n) states of fixed n,J treated at once). The algorithms were improved (BCB and REDUCE methods) and applied to the hfs of Zr II for (d+s)(sup 3) states. The fs intervals were determined to within 0.075 eV, and the hfs was only 17% in error; this represents the first time that all of the (d+s)(sup n) fs levels have been accurately determined by ab initio theory. Calculations for Nb III, La I, and Hf II (J=1.5) will be published when the J=0.5 calculations are complete. DOE

Studies of fundamental symmetries by the TRIPLE collaboration using the unique capabilities at LAMTF have found unexpected systematics in the parity-violating amplitudes for epithermal-neutron scattering. Tests to lower the present limits on time-reversal-invariance violation in the strong interaction are being made at in experiments on the scattering of polarized fast neutrons from aligned holmium targets. Studies of few-nucleon systems have received increasing emphasis over the past year, involving a broad program for testing the low- to medium-energy internucleon interactions, from the tensor component in n-p scattering and the n-n scattering lengths, through three-nucleon systems and the alpha particle, on up to Be-8. Of particular interest are three-nucleon systems, both in elastic scattering and in three-body breakup. Beam requirements range from production of intense and highly-polarized neutron beams to tensor-polarized beams for measurements at both very low energies (25-80 keV) and at tandem energies for definitive measurements of D-state components of the triton, He-3, and He-4 obtained from transfer reactions. The program in nuclear astrophysics expanded during 1991-1992. Several facets of the nuclear many-body problem and of excitation mechanisms of the nucleus are being elucidated, including measurements and analyses to elucidate the neutron-nucleus elastic-scattering interaction over a wide range of nuclei and energies. Several projects involved developments in electronuclear physics, instrumentation, RF-transition units, and low-temperature bolometric particle detectors. DOE

ELASTIC AND REACTIVE COLLISIONS OF ATOMS AND MOLECULES WITH NEUTRAL ALKALI CLUSTERS
A. Scheidemann (Washington Univ., Seattle.) and V. V. Kresin 14 Sep. 1992 7 p Presented at the 6th International Symposium on Small Particles and Inorganic Clusters, Chicago, IL, 16-22 Sep. 1992
(Contract W-7405-eng-48)
(DE93-009313; UCRL-JC-111650; CONF-920921-9) Avail: CASI HC A02/MF A01

We have measured absolute integral cross sections for low-energy collisions of atoms and molecules with neutral sodium clusters over a wide cluster size range (n = 2--40). The cross sections are exceptionally large, reaching values of thousands of square angstroms. Consequently, the scattering involves long-range interactions. The Van der Waals force, acting either along (Na(n) + N2) or in concert with the inelastic charge-transfer 'harpooning' channel (Na(n) + Cl2, Na(n) + O2) can describe the measurements. Using interaction parameters taken from spectroscopic studies of alkali clusters, we find very good agreement with the data. This provides a point of contact between beam scattering experiments and studies of cluster electromagnetic response properties. DOE

MEASUREMENT OF W-Z INTERFERENCE FROM NEUTRINO-ELECTRON SCATTERING
R. L. Burman, T. J. Bowles, R. D. Carlini, D. R. F. Cochran, P. J. Doe, J. S. Frank, M. E. Potter, V. D. Sandberg, D. A. Krakauer (Argonne National Lab., IL.), and R. L. Talaga (Argonne National Lab., IL.) 1993 7 p Presented at the International Symposium on 30 Years of Neutral Currents, Los Angeles, CA, 3-5 Feb. 1993
(Contracts W-7405-eng-36; DE-AC05-76ER-02504; W-31-109-eng-38)
(DE93-010724; LA-UR-93-1004; CONF-930293-1) Avail: CASI HC A02/MF A01

Neutrino-electron elastic scattering was observed at LAMPF with a 15-ton fine-grained tracking calorimeter exposed to electron-neutrinos from muon decay at rest. The measured nu(sub e)e(-) (yields) nu(sub e)e(-) elastic scattering cross section, 10.0 +/- 1.5(stat) +/- 0.9(syst) x 10(exp -45) sq cm x (E(sub nu)(MeV)), gives a model independent measurement of the strength of the destructive interference between the charged and neutral currents, I = -1.07 +/- 0.21, that agrees well with the standard model (SM) prediction I = -1.08. The agreement between the measured electroweak parameters and SM expectations is used to place limits on neutrino properties, such as neutrino flavor-changing neutral currents and neutrino electromagnetic moments and on the masses of hypothetical new bosons that would interact with leptons. DOE

NEUTRINO MASS
T. J. Bowles 1993 11 p Presented at the Texas/PASCO 1992 International Conference, Berkeley, CA, 13-18 Dec. 1992
(Contract W-7405-eng-36)
(DE93-010735; LA-UR-93-1009; CONF-921266-1) Avail: CASI HC A03/MF A01

Neutrinos play a dominant role in both particle physics, astrophysics, and cosmology. In the our present understanding of the strong, weak, and electromagnetic forces, the group structure of the Standard Model is SU(3)(sub C) (circle times) SU(2)(sub L) (circle times) U(l)(sub EM). In the Weinberg-Salam-Glashow Standard Electroweak Model, left-handed neutrinos sit in a doublet, while right-handed neutrinos are in a singlet, and therefore do not interact with the other known particles. Also in this model, the neutrinos are intrinsically massless. However, while the W-S-G model provides an amazingly accurate picture of our present cold Universe, it has a number of deficits. The Standard Model does not explain the origin of the group structure, it does not reduce the number of coupling constants required, nor does it offer any prediction for the physical masses of the particles. Thus, it is generally assumed that the Standard Model is but a subset of some larger gauge theory. A wide variety of Grand Unified field Theories (GUT's), Super Symmetric Models (SUSY), and Superstring models have been proposed as the model for this larger structure. In general, these models predict nonzero neutrino masses and contain mechanisms that provide for lepton-number violation. Thus, a variety of new phenomena are predicted, including finite neutrino masses and the possibility that neutrinos can oscillate from one type to another. DOE

(AD-A263363; TR-5) Avail: CASI HC A02/MF A01

We have used the scanning tunneling microscope (STM) to move adsorbates such as benzene molecules and Xe clusters in order to determine their initial adsorption site. This has allowed us to image the initiation of the growth of a Xe surface overlayer, and to identify the sites at which this growth begins. This capability has also allowed us not only to examine the binding sites of the adsorbates, but also to learn the effect that these sites have on the STM images. DTIC

FAST MULTIPOLE METHOD IN SIMULATIONS OF AQUEOUS SYSTEMS
James N. Glosli and Michael R. Philpott 14 Apr. 1993 14 p
(Contract N00014-92-C-0173)
(AD-A263422; TR-03) Avail: CASI HC A03/MF A01

The fast multipole method (fmm) for calculating electric fields developed by Greengard and Rokhlin (J. Comp. Phys. 73, 325(1987)), has been implemented specifically for molecular dynamics simulations of electrochemical problems including boundary conditions associated with metal electrodes. This order N (number of charged particles) algorithm is known to be computationally much more efficient than direct or Ewald sum methods (order N 2) for systems with as few as one thousand charged particles (equivalent to 300 water molecules). Timings and accuracy estimates with system size N (16 less than or N less than or equal 16000) are given to illustrate the effectiveness and efficiency of the fmm. As an application of fmm, we describe it's use with constant temperature molecular dynamics to calculate the dielectric constant of the space water model in bulk at temperatures 298 and 361 K. System sizes of 27, 64, 125, and 216 water molecules were considered. Comparison with the Ewald and reaction field methods was made. At 298 K, the dielectric constant was calculated to be epsilon = 75.5 + or - 5% and at 361 K epsilon = 57.3 + or - 4%. Both values compare well with experiment and the reaction field theory simulations. DTIC

NEW LIMITS ON GENERATION-1 LEPTOQUARKS
S. M. Moulding (Brandeis Univ., Waltham, MA.) Nov. 1992 5 p Presented at the Meeting of the Division of Particles and Fields of the American Physics Society, Batavia, IL, 10-14 Nov. 1992
(Contract DE-AC02-76CH-03000)
(DE93-008138; FNAL/C-92/341-E; CONF-921122-44) Avail: CASI HC A01/MF A01

With the turn-on of HERA there is currently considerable interest in the properties of first-generation leptoquarks. In this paper we present new results of a search for these particles at CDF. Our findings are based on an analysis of 4.1 pb(exp -1) of data collected at sq. root of s = 1.8 TeV during the 1988-89 Tevatron run. The leptoquarks are assumed to decay rapidly to first-generation leptons and quarks. We search for an excess of events containing two high energy electrons and two jets and find no events in our signal region. Events outside the signal region are consistent with Z(sup 0) + dijet production. Based on this, and assuming BR(LQ(sub 1) yields e + q) = 100 %, we exclude first-generation leptoquarks with masses M(LQ(sub 1)) less than 113 GeV at the 95% CL. At BR(LQ(sub 1) yields e + q) = 50 %, we exclude M(LQ(sub 1)) less than 82 GeV. DOE

FI-STM INVESTIGATION OF ATOMIC HYDROGEN ADSORPTION ON THE Si(100)2X1 SURFACE
Xiangdong Wang, T. Hashizume, H. Lu, H. W. Pickering, and T. Sakurai Apr. 1993 27 p
(Contract N00014-91-J-1189)
(AD-A262748) Avail: CASI HC A03/MF A01

A field ion-scanning tunneling microscopy study on hydrogen chemisorption on the Si(100)2x1 surface is presented. At low coverages, hydrogen atoms reside singly on top of the dimerised Si atoms, and are imaged brightly. The hydrogen chemisorption induces the buckling of dimers, indicating the strong bonding between Si and H atoms. With increasing coverage, both the 2x1 monohydride and 1x1 dihydride phases were formed. The former is imaged dark compared with the unreacted Si dimers, due to the reduction of the density of electronic states near the Fermi level. Surface etching was also observed. It was found that the corrosion of the surface is modest in the monohydride phase, while during the formation of the dihydride phase, the corrosion becomes significant. The behavior of hydrogen desorption from the dihydride and monohydride phases was investigated as a function of annealing temperature. Our STM results support the mechanism that the desorbing H2 molecules are formed by combination of two hydrogen atoms forming the dihydride phase. Upon annealing at elevated temperatures, the Si overlayer stripes are formed by desorption of hydrogen from the etching products and the rearrangement of the Si atoms. DTIC

CONSTRUCTION AND TESTING OF A NEUTRON AND GAMMA SPECTROMETRY SYSTEM USING PULSE SHAPE DISCRIMINATION WITH AN ORGANIC SCINTILLATOR M.S. Thesis
Robert S. Pope Mar. 1993 207 p
(AD-A262550; AFIT/GNE/ENP/93M-6) Avail: CASI HC A10/MF A03

The goal of this thesis was to construct and test a neutron detector to measure the energy spectrum of 1 to 14-MeV neutrons in the presence of gammas. A spectrometer based on the process of pulse shape discrimination (PSD) was constructed, in which the scintillator NE-213 was used. The primary neutron/gamma sources used were 78-mCi and 4.7-Ci Pu-239Be sources, while 4.7-micro-Ci and 97.6-micro-Ci Na-22 gamma sources were used for energy calibration and additional testing of the detector. Proton recoil spectra and Compton electron spectra were unfolded with the neutron and gamma unfolding code FORIST to generate the incident neutron and gamma spectra, respectively. FORIST, which was written for a CDC computer, was modified to run on a VAX 6420. The experimental spectra were compared to those in the literature. The locations of the peaks in the Pu-239Be spectrum agreed with the literature to within 8.3%, the Pu-239Be gamma spectrum agreed to within 0.7%, while the Na-22 gamma spectrum agreed exactly. Uncertainties in the detection system and unfolding procedure are on the order of 5-10%. This thesis is intended to be a summary of the relevant literature and a user's guide to the PSD spectrometer. THE PARALLEL IMPLEMENTATION OF A BACKPROPAGATION NEURAL NETWORK AND ITS APPLICABILITY TO SPECT IMAGE RECONSTRUCTION Ph.D. Thesis
J. P. Kerr 1992 54 p
(Contract DE-FG02-92ER-75700)
(DE93-010304; DOE/ER-75700/T3) Avail: CASI HC A04/MF A01

The objective of this study was to determine the feasibility of using an Artificial Neural Network (ANN), in particular a backpropagation ANN, to improve the speed and quality of the reconstruction of three-dimensional SPECT (single photon emission computed tomography) images. In addition, since the processing elements (PE)s in each layer of an ANN are independent of each other, the speed and efficiency of the neural network architecture could be better optimized by implementing the ANN on a massively parallel computer. The specific goals of this research were: to implement a fully interconnected backpropagation neural network on a serial computer and a SIMD parallel computer, to identify any reduction in the time required to train these networks on the parallel machine versus the serial machine, to determine if these neural networks can learn to recognize SPECT data by training them on a section of an actual SPECT image, and to determine from the knowledge obtained in this research if full SPECT image reconstruction by an ANN implemented on a parallel computer is feasible both in time required to train the network, and in quality of the images reconstructed. The low energy electron collisions with H2O and H2S have been studied for elastic and rotational excitation channels. A parameter-free ab initio approach is employed in which electron exchange interaction is treated exactly and the polarization effects via perturbation theory. The integro-differential coupled equations are solved iteratively to yield scattering parameters. Detailed results are obtained for differential, integral, and momentum transfer cross sections. The agreement with experimental data for all the parameters is very good. The intermediate and high energy electron scattering with a large number of diatomic and polyatomic molecules is studied between 20-5000 eV and results for total (elastic plus inelastic) cross sections are reported. MOLECULAR DYNAMICS MODELING OF ELECTRIC DOUBLE LAYERS WITH SPECTROSCOPIC APPLICATIONS Technical Report

M. R. Philpott and J. N. Glosli 14 Apr. 1993 8 p
(Contract N00014-92-C-0173)
(AD-A263168; TR-06) Avail: CASI HC A02/MF A01

Molecular dynamics is used to model the structure and dynamics of electric double layers at a charged metal surface and to ask questions of spectroscopic interest. In particular, what is the molecular basis for changing the position of the outer Helmholtz plane (OHP) thereby tuning the electric field across the inner layer? Another topic is the microscopic basis of modulation spectroscopies like SNIFTIRS. Our MD simulations of an immersed electrode show features corresponding to: compact layer, diffuse layer, highly oriented water layer next to the metal when the electrode is charged and ions are present; penetration of nominally diffuse layer species into inner layer; and ion pair formation between contact adsorbed ion and diffuse layer ion when the electrode is uncharged, poorly oriented surface water when the electrode is uncharged. All these properties arise from the model with the restriction that charge on the metal and aqueous phase sums to zero. DTIC

ADSORPTION OF HYDRATED HALIDE IONS ON CHARGED ELECTRODES: MOLECULAR DYNAMICS SIMULATION Technical Report

James N. Glosli and Michael R. Philpott 14 Apr. 1993 60 p
(Contract N00014-92-C-0173)
(AD-A263137) Avail: CASI HC A04/MF A01

Constant temperature molecular dynamics has been used to simulate the adsorption of hydrated halide ion X(-) = F(-), Cl(-), Br(-), and I(-), and lithium ion Li(+) on a flat uniformly charged surfaces. The simulations were done with either 214 water molecules and two ions (Li(+) and X(-)) in a box 2.362 nm deep or with 430 water molecules and the two ions in a box 4.320 nm deep. The boxes were periodically replicated in the xy directions. The magnitude of the surface charge on the box end was + or - 0.11 c/nm(sup 2), corresponding to an electric field of 2 x 10(exp 7) V/cm. The lateral dimensions of the simulation cell were 1.862 nm x 1.862 nm (x times y) in each case. All of the water molecules and ions interacted with the end walls via a weak 9 - 3 potential. The ST2 water model and parameters optimized for alkali halides interacting with the model ST2 water molecule were used in the calculations. Common practices of truncating the interactions at a finite distance (0.82 nm) and switching off Coulomb interactions at small distances were followed. The temperature was set at T = 2.411 kJ/mole (290 K). Some of the properties calculated were: distribution density profiles for ions and water across the gap important for comparisons iwth Gouy-Chapman theory, adsorbed ion-water pair correlation functions, the number of water molecules in the first and second hydration shells of the ions as a function of time. The time spent by a water molecule in the hydration shell was calculated to be approximately ten times longer for lithium than any other ion. The correlation between distance from the electrode and hydration number was studied and generally found to be pronounced for the larger anions. DTIC

NUCLEAR ISOMERS AS ULTRA-HIGH-ENERGY-DENSITY MATERIALS

C. H. Poppe, M. S. Weiss, and J. D. Anderson Apr. 1992 7 p
Presented at the 1992 Air Force High Energy Density Materials Contractors Meeting, Lancaster, CA, 12-14 Apr. 1992
(Contract W-7405-eng-48)
(DE93-009520; UCRL-JC-109928; CONF-9204235-1) Avail: CASI HC A02/MF A01

Nuclear isomers are metastable states of atomic nuclei which release their energy in a prompt burst of electromagnetic radiation. Two kinds of nuclear isomers are known to exist: spin isomers and shape isomers. There is evidence for at least 27 different fissionless shape isomers in isotopes of mercury, lead, and thallium, in agreement with theoretical predictions. Three potential mechanisms for releasing the stored isomeric energy are neutron catalysis, laser-electron-nuclear coupling, and Stark-shift-induced mixing. While shape isomers are believed to hold the most promise for radioactivity-free, ultra-high-energy-density materials, spin isomers can be used as surrogates for developing the release mechanisms. It is proposed to undertake shell-model calculations for the nuclear levels in vicinity of the (sup 178)Hf spin isomer, in order to estimate the efficacy of neutron catalysis. It is also proposed to use the toroidal electron spectrometer to measure the conversion electrons from laser-induced transitions in (sup 229)Th. The final mechanism, Stark-shift-induced mixing of atomic and nuclear levels, would also be studied theoretically. Finally, isomer production is considered briefly, including the possibility of shape isomers in fission products from radwaste or nuclear explosions. DOE

ELECTRON TRANSPORT CALCULATIONS BETWEEN 1 MeV AND 1 eV Final Report, Sep. 1989 - Jul. 1992

Stanley Woolf Dec. 1992 50 p
(Contract F19628-89-C-0189)
(AD-A263412; RL-TR-92-311) Avail: CASI HC A03/MF A01

In this report, we describe mathematical analysis, physics research, and computer program development for the simulation of charged particle transport in irradiated and non-irradiated solids. The simulation techniques described were used to calculate energy deposition, charge, and current distributions in these solids. The scope of the work included: (1) discrete ordinates transport calculations of low energy (l eV to 20 eV) electrons in silicon dioxide with and without electric fields; (2) comparison testing of one-dimensional discrete ordinates transport codes for charged and neutral particles with analytical benchmark calculations; (3) Monte Carlo transport calculations for low energy electrons in the presence of strong electric fields in silicon dioxide; and (4) Monte Carlo transport calculations for high energy (MeV) electrons in insulating materials with internal electric fields. NMR STUDIES OF MOLECULES IN LIQUID CRYSTALS AND GRAPHITE Ph.D. Thesis
M. E. Rosen Jun. 1992 174 p
(Contract DE-AC03-76SF-00098)
(DE93-010423; LBL-33520) Avail: CASI HC A08/MF A02

NMR experiments to measure proton dipole couplings were performed on a series of n-alkanes (n-hexane through n-decane) dissolved in nematic liquid crystals. Computer modeling of the experimental NMR-spectra was done using several different models for intermolecular interactions in these systems. The model of Photinos et al. was found to be best in describing the intermolecular interactions in these systems and can provide a statistical picture of the conformation and orientation of the alkane molecules in their partially-oriented environment. Order parameters and conformational distributions for the alkanes can be calculated from the modeling. The alkanes are found to have conformational distributions very much like those found in liquid alkanes. Proton NMR spectra of tetrahydrofuran (THF) intercalated in two graphite intercalation compounds were also measured. Computer simulations of these spectra provide a picture of THF in the constrained environment between the graphene layers where the THF is oriented at a particular angle, can translate and rotate freely, but does not appear to pseudorotate. REACTION MECHANISM STUDIES OF HEAVY ION INDUCED NUCLEAR REACTIONS
A. C. Mignerey Feb. 1993 46 p
(Contract DE-FG05-87ER-40321)
(DE93-010496; DOE/ER-40321/12) Avail: CASI HC A03/MF A01

Completed work is summarized on the topics of excitation energy division in deep-inelastic reactions and the onset of multifragmentation in La-induced reactions at E/A = 45 MeV. Magnetic fields are being calculated for the PHOBOS detector system, a two-arm multiparticle spectrometer for studying low-transverse-momentum particles produced at the Relativistic Heavy Ion Collider. The Maryland Forward Array is being developed for detection of the reaction products from very peripheral collisions; it consists of two individual units of detectors: the annular silicon detector in front and the plastic phoswich detector at back. OBSERVATION OF PHASE-SEPARATED NANOMETER SCALE MOLECULAR DOMAINS IN MIXED SELF-ASSEMBLED MONOLAYERS Technical Report, 1 Jun. 1992 - 31 May 1993
S. J. Stranick, P. S. Weiss, A. N. Parikh, Y. T. Tao, and D. L. Allara 13 Apr. 1993 16 p
(Contract N00014-91-J-1630)
(AD-A263470; Rept-TR-8) Avail: CASI HC A03/MF A01

We demonstrate the phase separation, into nanometer scale domains, of two-component monolayers, prepared by self-assembly on gold, of CH3(CH2)15SH and CH3O2C(CH2)15SH, two similar, non-hydrogen bonding alkane thiols of identical alkyl chain length. By varying the fractions of the two components, we have learned to distinguish between domains of each molecule by scanning tunneling microscopy. These observations have important implications for both the scientific understanding of phase segregation in quasi-two-dimensional molecular mixtures and for applications of self-assembly in which the formation of spatially resolved mixed functional group surfaces is desired (targeted). Further, these observations provide a caveat with regard to the common assumption of complete mixing in multi-component self-assembled monolayers. DTIC

REACTION AND REORIENTATION OF ELECTRONICALLY EXCITED H2(B) Ph.D. Thesis
C. D. Pibel Sep. 1992 227 p
(Contract DE-AC03-76SF-00098)
(DE93-010435; LBL-33473) Avail: CASI HC A11/MF A03

The room temperature rate (TR) constants for fluorescence quenching fluorescence of H2, HD, and D2 B (sup 1)Sigma(sub u)(sup +) by He-4 were measured as a function of the initially excited rotational and vibrational level of the hydrogen molecule, and the RT rate constants for molecular angular momentum reorientation of H2, HD and D2 (B (sup 1)Sigma(sub u)(sup +), v' = 0, J' = 1, M(sub J) = 0) in collisions with He, Ne, Ar and H2(X (sup 1)Sigma(sub g)(sup +)) were also measured. Vibrational state dependence of the quenching cross sections fits a vibrationally adiabatic model of the quenching process. From the vibrational state dependence of the quenching cross section, the barrier height for the quenching reaction is found to be 250 plus or minus 40 cm(sup -1), and the difference in the H-H stretching frequencies between H2(B) and the H2-He complex at the barrier to reaction is 140 plus or minus 80 cm(sup -1). The effective cross sections for angular momentum reorientation in collisions of H2, HD, and D2 with He and Ne were found to be about 30 A(sup 2) and were nearly the same for each isotope and with He and Ne as collision partners. Cross sections for reorientation of HD and D2 in collisions with Ar were 10.6 plus or minus 2.0 and 13.9(plus or minus) 3.0 A(sup 2), respectively. Reorientation of D2(B) in collisions with room temperature H2(X) occurs with a 7.6 plus or minus 3.4 A(sup 2) cross section. Calculated cross sections using semiclassical and quantum close coupled methods give cross sections for reorientation of H2(B) and D2(B) in collisions with He that agree quantitatively with experiment. Discrepancy between the calculated and experimental cross sections for HD(B)-He are likely due to rotational relaxation in HD. A Turbo PASCAL version of the data-taking program is included. DOE

(DE93-011535; DOE/ER-40631/2) Avail: CASI HC A03/MF A01

The program of physics analysis using CLEO II data is reported. A statistically significant measurement was made of the isospin mass splitting of the Sigma(sub c)(sup +) with respect to the Sigma(sub c)(sup o) and Sigma(sub c)(sup ++). This result is based on first observation of the Sigma(sub c)(sup +) in the decay mode Lambda(sub c)(sup +)pi(sup 0). Many new decay modes of the charmed baryon Lambda(sub c)(sup +) were studied. Several new decay modes of xi(sub c)'s were observed. Some preliminary results on 3 new modes of Omega(sub c)(sup 0) decay are reported. In the area of B-meson decay into baryons, the decays B yields Sigma(sub c)(sup 0) and Sigma(sub c)(sup ++) were observed conclusively. From about 1500 events corresponding to B yields Lambda(sub c)(sup +)X reconstruction of exclusive final states of the form Lambda(sub c)(sup +)(n(pi)) was started. A comprehensive investigation of particle identification using both the time-of-flight and dE/dx systems was made. Measurement of pion, kaon, and proton identification efficiencies were made, corresponding to several different selection criteria. Measurements of corresponding pion probabilities to fake kaons and protons were also made. DOE

PARTIAL CROSS SECTIONS IN H(-) PHOTODETACHMENT Ph.D. Thesis
M. Halka Apr. 1993 172 p
(Contract W-7405-eng-36)
(DE93-011570; LA-12533-T) Avail: CASI HC A08/MF A02

Experimental measurements of partial decay cross sections in the H(-) photodetachment spectrum are reported. Observed decays of the (P(sub 0))-1 H(-)(sup **)(n) doubly-excited resonances to the H(N=2) continuum are reported for n=2, 3, and 4 from 1990 runs in which the author participated. A recent analysis of 1989 data revealing effects of static electric fields on the partial decay spectrum above 13.5 eV is also presented. The experiments were performed at the High Resolution Atomic Beam Facility (HIRAB), the Los Alamos Meson Physics Facility (LAMPF), with a relativistic H(-) beam (beta = 0.842) intersecting a ND:YAG laser. Variation of the intersection angle amounts to Doppler-shifting the photon energy, allowing continuous tuning of the laser energy as viewed from the moving ions' frame. DOE

CENTER FOR SURFACE RADIATION DAMAGE STUDIES Final Report, 15 Sep. 1989 - 30 Nov. 1992
Laurence D. Marks 28 Feb. 1993 29 p
(Grant AF-AFOSR-0045-90)
(AD-A264330; Rept-0650-350-W410; AFOSR-93-0273TR) Avail: CASI HC A03/MF A01

Research focussed around understanding surface damage processes at the atomistic microstructure level was performed using high resolution electron microscopy in ultra-high vacuum and by other techniques. Techniques for obtaining clean and well-ordered surfaces and understand the image obtained were developed and used to characterize damage processes. This data, combined with other high resolution electron microscopy data was combined with analytical and numerical models with a high degree of success. Attempts to produce a small atomic oxygen source based upon electron stimulated desorption of oxygen neutrals led to the conclusion that literature estimates are much too high for the neutral to ion ratio. A strong upper bound was placed on this ratio of greater than 10, whereas values in the literature are as high as 10. DTIC

The properties (crystalline density, orientation, defects, H bonds) of high explosive (HE) single crystals affect the performance and sensitivity of the material. A computer code is being developed to model and predict the properties of molecular HE crystals. The intermolecular interaction energy is the sum of repulsion, dispersion, and electrostatic contributions. A more accurate electrostatic treatment was implemented by using multipole expansions. The formulations were implemented into the crystallographic packing code PCK/ME. The performance of this program was evaluated with a series of HE and other organic compounds. Crystal structures for a set of 15 molecules were optimized using the model with quadrupole level expansion for the electrostatics. The largest errors were for systems with strong hydrogen bonds; corrections were applied. The electrostatic interaction energy was equal to about half the total interaction energy for almost all the molecules. DOE

Two topics of current interest, strongly anharmonic collective vibrations and collective rotation about a tilted axis, have been related through a theorem. This theorem, which will be called the Bifurcation Theorem, states that if a system has an axis of rotational symmetry in a static mean-field approximation, then self-consistent cranking about this axis gives rise to symmetry-breaking bifurcations that occur for critical cranking frequencies (Omega)(sub c) given by Omega(sub c) = omega(sub mu)/K(sub mu), where omega(sub mu) is the small-oscillation (RPA) frequency of any normal mode carrying (h bar)K(sub mu) (not = 0) units of angular momentum along the symmetry axis. The bifurcations represent families of anharmonic oscillations built on the axially symmetric mean field. For certain values of K(sub mu), the solutions appear as rotations about an axis that is tilted with respect to the principal axis of the density distribution. The theorem has been tested on some simple models in preparation for more realistic calculations that are planned for the near future. DOE

ORDERED MOLECULAR ARRAYS AS TEMPLATES: A NEW APPROACH TO SYNTHESIS OF MESOPOROUS MATERIALS Technical Report, 1 Jun. 1992 - 31 May 1993
P. Behrens and G. Stucky 1993 9 p
(Contract N00014-90-J-1159)
(AD-A264631) Avail: CASI HC A02/MF A01

There has been a growing interest in the extension of the microporous molecular sieve synthesis and applications to mesoscopic dimensions. Typical areas for the application of mesoscopic zeolite-type structures are in separation (e.g., protein separation and selective adsorption of large organic molecules from waste waters) and catalysis (e.g., processing of tar sand and of the high distillates of crude oils to valuable low-boiling products). Another is in the supramolecular assembly of molecular array and polymers for electronic and optical applications. In a new concept in the synthesis of porous material the templating agent is no longer a single, solvated, organic molecule or metal ion, but rather a self-assembled molecular array. This template leads to mesoporous materials with adjustable pore sizes between 16 and greater than 100 Angstrom, covering well the mesophorous range of greatest interest. The periodic arrangement of pores is very regular, and the pore size distribution measured by absorption is nearly as sharp as that of conventional zeolites. DTIC

The goal of this project was to produce a source which is compact, durable, and mounts on a standard UHV flange for the generation of hyperthermal oxygen atoms. This has been accomplished. In this source, oxygen atoms permeate through a Ag membrane held at 500 C and are then emitted toward the target from the vacuum side of the membrane by electron stimulated desorption (ESD). The current prototype model generates usable O-atom fluxes of about 10(exp 12) atoms/sq cm/s, and future modifications should increase this flux by 1 to 3 orders of magnitude. Based on the O+ energy distribution, the average O neutral energy is about 5 eV with a fairly broad distribution (FWHM approx. equal 3.6 eV). The information required for the development of this source and a design of the source are presented. DTIC

(ETN-93-93622) Avail: CASI HC A05/MF A01

Calculation methods are improved to evaluate precision data from large electron positron collider and hadron electron ring facility measurements, by considering electroweak interaction standard model and quantum chromodynamics as theory of the strong interaction. The electromagnetic radiation (bremsstrahlung) corrections for processing weak interaction at high energies were considered, with focus on Z(null) resonance neighboring. The Kulish-Fadeev form of Hamilton operator and the S matrix theory were used and degeneration singularities were taken into account with a highly energetic scatter process. Schroedinger equation was solved with the Magnus method. The calculated terms were taken into account with the desired order in the Baker Campbell Hausdorff identity. The method was applied to Bhabha scattering and a recursion relationship was obtained for the scattering amplitude, which was implemented in a Monte-Carlo event generator, which can produce a large number of photons. The simulated cross sections were found to be positive and the method is shown to be efficient for infrared and mass singularities handling. ESA

COUPLED-CHANNEL ANALYSIS OF LOW ENERGY NUCLEON-ANTINUCLEON INTERACTIONS
V. K. Henner (Moscow State Univ., Russia.) and V. A. Meshcheryakov 1991 20 p Presented at the Nucleon-Anti-Nucleon Conference (NAN 1991), Moscow, Russia, 10 Jul. 1991 Submitted for publication
(DE93-606115; JINR-E-2-91-360) Avail: CASI HC A03/MF A01 (US Sales Only)

The multichannel M-matrix method is applied to an N(bar-N)-system that takes into account elastic p(bar-p)-scattering, the charge-exchange p(bar-p) yields n(bar-n) reaction, and p(bar-p) annihilation. It is shown that, contrary to standard assumptions, the isotopic invariance due the large influence of the charge exchange channel very significantly affects the parameters of strong interactions. Contrary to previous descriptions, M-matrix elements are treated as real functions. The differential and total cross-sections for p(bar-p) yields p(bar-p) and p(bar-p) yields n(bar-n) processes, cross-section delta(sub tot)(p(bar-p)) and the real-to-imaginary ratio of the forward amplitude of elastic p(bar-p) scattering up to beam momenta p(sub lab) = 600 MeV/c are described. The fitting leads to a resonance in the s-wave at about p(sub lab) = 500 MeV/c and to bound states in p-wave near the pp-bar threshold. DOE

(DE93-606125; JINR-E-2-91-475) Avail: CASI HC A03/MF A01 (US Sales Only)

Peculiar features of the recent global analysis of data on the nucleon electromagnetic structure are discussed. This was done in order to reconsider the reliability of the predicted result that the electron-positron annihilation into a neutron-antineutron cross-section is considerably larger that the cross-section of the electron-positron annihilation into a proton-antiproton pair. PLANCK SCALE EFFECTS IN NEUTRINO PHYSICS
E. K. Akhmedov, G. Senjanovic, Zhi-Jan Tao, and Z. G. Berezhiani (Ludwig-Maximilians-Univ., Munich, Germany.) Aug. 1992 22 p
(DE93-606133; IC-92/196; SISSA-140/92/EP; LMU-09/92) Avail: CASI HC A03/MF A01 (US Sales Only)

We study the phenomenology and cosmology of the Majoron (flavon) models of one inert neutrino and three active ones. We pay special attention to the possible (almost) conserved generalization of the Zeldovich-Konopinski-Mahmoud lepton charge. Using Planck scale physics effects, which provide the breaking of the lepton charge, we show how, in this picture, one can incorporate the solutions to some of the central issues in neutrino physics, such as the solar and atmospheric neutrino puzzles, dark matter, and a 17 keV neutrino. These gravitation effects induce tiny Majorana mass terms for neutrinos and considerable masses for flavons. The cosmological demand for the sufficiently fast decay of flavons implies a lower limit on the electron neutrino mass in the range of 0.1-1 eV. DOE

DEFINING PROTEIN ELECTROSTATIC RECOGNITION PROCESSES Final Report, 1 Dec. 1988 - 30 Nov. 1991
Elizabeth D. Getzoff and Victoria A. Roberts 1992 5 p
(Contract N00014-89-J-11745)
(AD-A264838) Avail: CASI HC A01/MF A01

The objective is to elucidate the nature of electrostatic forces controlling protein recognition processes by using a tightly coupled computational and interactive computer graphics approach. The TURNIP program was developed to determine the most favorable precollision orientations for two molecules by systematic search of all orientations and evaluation of the resulting electrostatic interactions. TURNIP was applied to the transient interaction between two electron transfer metalloproteins, plastocyanin and cytochrome c. The results suggest that the productive electron-transfer complex involves interaction of the positive region of cytochrome c with the negative patch of plastocyanin, consistent with experimental data. Application of TURNIP to the formation of the stable complex between the HyHEL-5 antibody and its protein antigen lysozyme showed that long-distance electrostatic forces guide lysozyme toward the HyHEL-5 binding site, but do not fine tune its orientation. Determination of docked antigen/antibody complexes requires including steric as well as electrostatic interactions, as was done for the U10 mutant of the anti-phosphorylcholine antibody S107. The graphics program Flex, a convenient desktop workstation program for visualizing molecular dynamics and normal mode motions, was enhanced. Flex now has a user interface and was rewritten to use standard graphics libraries, so as to run on most desktop workstations. DTIC

SINGLE t-QUARK PRODUCTION IN HIGH ENERGY (GAMMA)e COLLISIONS

G. V. Jikia 1991 23 p
(DE92-644947; IHEP-OTF-91-33) Avail: CASI HC A03/MF A01 (US Sales Only)

The explicit formulae for the cross sections of single t-quark production in gamma-e collisions are presented. The contribution of the hadronic structure of the photon to the production cross sections is also calculated. Total t-quark and fourth generation b'-quark production rates and discuss theoretical uncertainties are evaluated. Assuming the luminosity of 10(exp 33) cm(exp -2)s(exp -1) in TeV energy range, we estimate that the Cabibbo-Kobayashi-Maskawa matrix element V(sub tb) can be probed to an accuracy of 3-5%. DOE

MASSIVE MAJORANA NEUTRINOS IN PRE-BOUNCE SUPERNOVAE

S. Goswami (Calcutta Univ., India.), K. Kar (Saha Inst. of Nuclear Physics, Calcutta, India.), and A. Raychaudhuri Jun. 1992 22 p
(DE92-642597; IC-92/92; CUPP-92/3) Avail: CASI HC A03/MF A01 (US Sales Only)

The currently accepted models of supernova collapse rely on the standard electroweak theory and massless left-handed neutrinos. We consider the effect of massive right-handed Majorana neutrinos on this scenario. In order that they do not upset the agreement of the usual treatment with observation, we require that in the pre-bounce stage either (1) these neutrinos are trapped, or (2) if they free stream they do not change the electron fraction to the extent that the explosion is prevented. From these constraints, we obtain upper and lower bounds on the right-handed interaction strengths as a function of the neutrino mass which can be translated to bounds on the right-handed gauge boson mass. LOW-ENERGY BEHAVIOUR OF FEW-PARTICLE SCATTERING AMPLITUDES IN TWO DIMENSIONS

S. K. Adhikari and W. L. Gibson (Sydney Univ., Australia.) Jun. 1992 29 p
(DE93-609834; IFT-P-024/92) Avail: CASI HC A03/MF A01 (US Sales Only)

A study of the analytic behavior of different few-particle scattering amplitudes at low energies in two space dimensions is presented. Such a study is of use in modeling and understanding different few-particle processes at low energies. A detailed discussion of the energy and the momentum dependence of the partial-wave on-the-energy-shell and off-the-energy-shell two-particle t matrices is given. These t matrix element tend to zero as the energy and momentum variables tend to zero. The multiple scattering series is used to show that the connected three-to-three amplitudes diverge in the low energy-momentum limit. Unitarity relations are used logarithmic singularities at the m particle breakup threshold. The subenergy singularity in the two-to-three amplitudes is also studied, and comments are made on some applications of the present study in different problems of physical interest. DOE

BARYON NUMBER VIOLATION AND PARTICLE COLLIDER EXPERIMENTS

F. R. Klinkhamer Sep. 1992 11 p Submitted for publication
Sponsored by Royal Netherlands Academy of Arts and Sciences
(NIKHEF-H/92-14; ETN-93-94085) Avail: CASI HC A03/MF A01

Baryon number nonconservation, due to nonperturbative effects (sphalerons) in the standard model, may have been important in the early Universe. The possibility that similar effects could show up at future particle collider experiments is discussed. These would be multiparticle events with average transverse momenta of the order of p(sub t) approximately equal to M(sub W). A motivation to look for these effects in laboratory experiments is to be sure of the physics that goes into the early Universe. ESA

MEASUREMENTS OF RARE COMPOSITE OBJECTS AND HIGH SENSITIVITY SEARCHES FOR NOVEL FORMS OF MATTER PRODUCED IN HIGH ENERGY HEAVY ION COLLISIONS
1993 10 p
(Contract DE-FG02-90ER-40562)
(DE93-009945; DOE/ER-40562/T1) Avail: CASI HC A02/MF A01

The program consists of two complementary parts. First, searches for new particles include strange quark matter, as well as strange chiral solitons and multistrange hypernuclei. These and other new phenomena may result from the extreme conditions present in relativistic heavy ion collisions, which is a regime that is still relatively new and untested. Second, measurements will be made of known particles, such as the coalescence production of nuclei and antinuclei. Knowledge of coalescence production is not only crucial to interpreting the limits in strange matter searches, but also is useful in probing the relativistic heavy ion collision process. While data analysis is proceeding efforts will focus on the construction, running, and analysis of a new more precise experiment. The heavy ion program at BNL's RHIC accelerator will continue. This will be a 'fixed-target' experiment using a gas jet or pellet target that would extend studies of new particles in the high energy regime offered by this new accelerator. DOE

Detlef Filges Apr. 1992 208 p In GERMAN
(Juel-2609; ETN-93-93464) Avail: CASI HC A10/MF A03

The application potential of modern particle radiation transport simulations to solve safety and radiation protection problems in accelerator technology and in space science and technology is presented. It is shown to what extent Monte Carlo simulation is helpful in defining safety regulations, safety standards and in determining corresponding safety proofs. For this purpose the basic methods are described and their performance together with particular examples are assessed. The state of the art of the computational methods is described together with the existing computer codes. The details of the current three dimensional geometry packages are also given. Necessary nuclear transport data and reaction cross sections in respect to shielding and safety protection problems are investigated. The performance and flexibility of HERMES (High Energy Radiation Monte Carlo Elaborate System), and its utilization in solving safety protection problems are demonstrated. Examples of radiation protection and high energy source shielding for medium and high energy particle accelerators and for high current particle accelerator target systems are summarized. Radiation protection and shielding of space vehicles against cosmic ray radiation are compiled and assessed. Validations of experimental results are also given. ESA

MAXIMIZING THE LUMINOSITY OF HADRON, SUPERCOLLIDERS AT 10-100 TeV
W. A. Barletta (California Univ., Los Angeles.) Jul. 1992 38 p Presented at the 19th INFN Eloisation Project: Maximizing Luminosity of Hadron Colliders At 100 TeV, Erice, Italy, 13-19 Nov. 1991
(Contract W-7405-eng-48)
(DE93-009247; UCRL-JC-110768; CONF-9111208-4) Avail: CASI HC A03/MF A01

As physicists seek to build colliders of ever higher energy, they are generally faced with the task of simultaneously increasing the luminosity to compensate for the decrease in cross sections. Extending the physics reach and discovery potential of hadron supercolliders to the maximum extent will require accelerator designers Teaming how to achieve luminosities much greater than 10(exp 35) cm(exp -2)/s at energies of at least 100 TeV per beam. The application of the presently available accelerator technologies embodied in the designs of the LHC (at 8 TeV per beam and 10(exp 34)cm(exp -2)/s) and the SSC (20 TeV per beam at 10(exp 33) cm(exp -2)/s) to an ELOISATRON (ELN) operating at 100 TeV per beam would yield a collider design with a luminosity of 10(exp 34) cm(exp -2)/s. Yet higher energies and luminosities are clearly possible. This paper presents a general context for assessing the performance of future hadron colliders. It begins by illustrating machine trends and by defining of key collider characteristics. Descriptions of limiting beam physics and limiting accelerator technologies constitute the next two sections. These considerations have been folded into a simple spreadsheet-based computer code that allows one to perform self-consistent parameter searches to maximize luminosity. Section five presents some results from the parameter searches. The paper concludes with by sketching the characteristics of an ultimate hadron supercollider, i.e., an Ultra-ELOISATRON (UELN). DOE

ANNUAL PROGRESS REPORT ON THE NSRR EXPERIMENTS, (21)
May 1992 210 p
(DE93-753190; JAERI-M-92-072) Avail: CASI HC A10/MF A03

Fuel behavior studies under simulated reactivity-initiated accident (RIA) conditions have been performed in the Nuclear Safety Research Reactor (NSRR) since 1975. This report gives the results of experiments performed from April, 1989 through March, 1990 and discussions of them. A total of 41 tests were carried out during this period. The tests are distinguished into pre-irradiated fuel tests and fresh fuel tests; the former includes 2 JMTR pre-irradiated fuel tests, 2 PWR pre-irradiated fuel tests, and 2 BWR pre-irradiated fuel tests, and the latter includes 6 standard fuel tests (6 SP(center dot)CP scoping tests), 7 power and cooling condition parameter tests (4 flow shrouded fuel tests, 1 bundle simulation test, 1 fully water-filled vessel test, 1 high pressure/high temperature loop test), 12 special fuel tests (3 stainless steel clad fuel tests, 3 improved PWR fuel tests, 6 improved BWR fuel tests), 3 severe fuel damage tests (1 high temperature flooding test, 1 flooding behavior observation test, 1 debris coolability test), 3 fast breeder reactor fuel tests (2 moderator material characteristic measurement tests, 1 fuel behavior observation test), and 2 miscellaneous tests (2 preliminary tests for pre-irradiated fuel tests). AN EXPERIMENTAL INVESTIGATION OF RADIOACTIVITY INDUCED BY IONS ASSOCIATED WITH THE OPERATION OF PULSED-POWER ACCELERATORS

S. K. Vosburg, C. L. Ruiz, G. W. Cooper (New Mexico Univ., Albuquerque.), and F. A. Schmidlapp (Ktech Corp., Albuquerque, NM.) Mar. 1993 91 p
(Contract DE-AC04-76DP-00789)
(DE93-011478; SAND-92-2075) Avail: CASI HC A05/MF A01

Energetic light ion beams are being studied in Sandia National Laboratories' Particle Beam Fusion Accelerator II (PBFA II) for the purpose of studying the physics of applied B-diodes with the hope that these beams can be applied to inertial confinement fusion. These beams induce nuclear reactions both in the diode itself and in the materials surrounding the diode. A series of experiments was conducted wherein samples of metals typically used in the diode/gas cell region of PBFA II were exposed to ion beams at energies expected to be achieved in PBFA II. The metals studied were aluminum alloys 2024 and 6061, brass, copper, Inconel alloys 625 and 718, Stainless Steel 304, tantalum, titanium, and tungsten. The ion beams studied consisted of protons at energies of 6, 12, and 19 MeV; deuterons at 6 MeV; Lithium-7 at energies of 10, 15, 20, and 30 MeV; Lithium-6 at 30 MeV; and Boron-10 and Boron-11 at 30 MeV. The induced activity of each sample was measured as a function of time with an ion chamber and was used to estimate the rate at which the initial short-lived activity of the sample decayed. In addition, the activity of each sample was periodically measured with a Geiger counter in contact with the irradiated surface of the sample, was normalized to the total amount of energy incident on the sample, and was used as a basis to compare the amount of activity generated per mega-joule of energy for each sample. Additionally, gamma-ray spectra of the activated samples were collected using a germanium detector, and these spectra were analyzed qualitatively to identify the long-lived radioisotopes present in the sample. AN RF DRIVEN H(-) SOURCE AND A LOW ENERGY BEAM INJECTION SYSTEM FOR RFQ OPERATION

K. N. Leung, D. A. Bachman, C. F. Chan, and D. S. McDonald 1992 4 p Presented at the International Conference on High Energy Accelerators, Hamburg, Germany, 20-24 Jul. 1992
(Contract DE-AC03-76SF-00098)
(DE93-010438; LBL-32593; CONF-920706-50) Avail: CASI HC A01/MF A01

An RF driven H(-) source has been developed at LBL for use in the Superconducting Super Collider (SSC). To date, an H(-) current of approximately 40 mA can be obtained from a 5.6-cm diam. aperture with the source operated at a pressure of about 12 m Torr and 50 kW of RF power. In order to match the accelerated H(-) beam into the SSC RFQ, a low-energy H(-) injection system has been designed. This injector produces an outgoing H(-) beam free of electron contamination, with small radius, large convergent angle, and small projectional emittance. DOE

DESIGN AND TEST OF A SUPERCONDUCTING RFQ FOR HEAVY IONS

I. Ben-Zvi (State Univ. of New York, Stony Brook.), A. Jain (State Univ. of New York, Stony Brook.), J. W. Noe (State Univ. of New York, Stony Brook.), P. Paul (State Univ. of New York, Stony Brook.), and H. Wang (State Univ. of New York, Stony Brook.) 1992 7 p Presented at the 6th International Conference on Electrostatic Accelerators and Associated Boosters, Padua, Italy, 1-4 Jun. 1992
(Contract DE-AC02-76CH-00016)
(DE93-010862; BNL-48571; CONF-920656-5) Avail: CASI HC A02/MF A01

A prototype SRFQ resonator optimized for a velocity of (beta)=0.03 and a charge to mass ratio (q/M) of 1/6 was designed, fabricated, and tested. This is a short RFQ structure (only 2(beta)(lambda) long) operating at 57.4MHz. The resonator is made of copper, and a 1.5 micron thick layer of electroplated Pb-2 at.% Sn is used as the superconductor. The electrical characteristics of the resonator derived from detailed 3-D numerical simulations using the MAFIA codes and also from measurements on the actual resonator are described. The multipactoring levels could be processed away with ease. Quality factor (Q) is greater than 1(10)(exp 8) is obtained for E(sub a) up to 1 MV/m. Other parameters relevant to superconducting operation are also presented. DOE

HIGH-CURRENT NEGATIVE-ION BEAM TRANSPORT

R. R. Stevens, Jr. 1993 11 p Presented at the 6th International Symposium on the Production and Neutralization of Negative Ions and Beams, Long Island, NY, 9-13 Nov. 1992
(Contract W-7405-eng-36)
(DE93-010732; LA-UR-93-1038; CONF-921145-6) Avail: CASI HC A03/MF A01

The requirements for transporting high-current, negative-ion beams are presented with particular emphasis on applications involving negative-hydrogen-ion beams. In addition to the usual matching and steering problems, particular attention must be paid to beam emittance growth in the transport system. Depending on the application, a number of approaches have been developed using both magnetic and electric lenses. I discuss the design considerations for transporting and matching these beams to radiofrequency quadrupole accelerators, and present a survey of the various types of beamlines now used for negative-ion beams. THREE-DIMENSIONAL SIMULATION ANALYSIS OF THE STANDING-WAVE FREE-ELECTRON LASER TWO-BEAM ACCELERATOR

C. Wang and A. Sessler Jan. 1993 5 p Presented at the OE/LASE International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract DE-AC03-76SF-00098)
(DE93-010461; LBL-32481; ESG-199; CONF-930159-26) Avail: CASI HC A01/MF A01

We have modified a two-dimensional relativistic klystron code, developed by Ryne and Yu, to simulate both the standing-wave free-electron laser two-beam accelerator and the relativistic klystron two-beam accelerator. In this paper, the code is used to study a standing-wave free-electron laser with three cavities. The effect of the radius of the electron beam on the RF output power (a three-dimensional effect) is examined. DOE

TRAB: A TRANSIENT ANALYSIS PROGRAM FOR BWR. PART 2: USER'S MANUAL

Hanna Raty and Markku Rajamaeki May 1991 155 p
(VTT-TIED-1232-Pt-2; ISBN-951-38-3875-7; ETN-93-93771) Copyright Avail: CASI HC A08/MF A02

A user manual with documentation of the structure, contents, and preparation of input, for the TRAB (Transient Analysis) code for BWR's (Boiling Water Reactors) is presented. TRAB models the phenomena in the interior of the BWR pressure vessel and in related subsystems. The code model of TRAB can be used separately for LWR (Light) modeling. For PWR (Pressurized) modeling the core model of TRAB is connected to circuit model SMABRE to form the SMATRA code. The structure of TRAB input is very flexible, featuring input groups and subgroups identified with keywords and given in any order as well as data items in free format, freely mixed with explanatory texts. The user interface of the code can be used for modeling within input; through normal input it is possible to create new submodels. These may be functional or tabulated dependencies of the code variables, different types of delays, or ordinary linear differential equations (control systems). ESA

RESEARCH AND EDUCATION BY SF CYCLOTRON FACILITY
Apr. 1992 51 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-753135; INS-T-507) Avail: CASI HC A04

This report represents the current activities in research and education using the cyclotron facility and related apparatus which are supported by Nuclear Physics Division and this is a continuation of INS-T-466 (1986, December). In this version, an iron-free beta-ray spectrometer and a cooler-synchrotron (TARN 2) are briefly described also in the first chapter. The second chapter explains experimental programs performed in the last 5 years. The third chapter gives the number of publications on researches performed in 1975-1991, and also gives twelve topics obtained from the cyclotron and the beta-ray spectrometer in recent 5 years. The last chapter provides the whole list of the works for Doctor and Master theses performed at the facility in the last 10 years. DOE

AIR OXIDATION BEHAVIOR OF FUEL FOR THE HIGH TEMPERATURE ENGINEERING TEST REACTOR (HTTR)
Hironobu Kikuchi, Kimio Hayashi, and Kousaku Fukuda Aug. 1992 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-753349; JAERI-M-92-114) Avail: CASI HC A03

The oxidation behavior of the HTTR fuel was studied with respect to the scenario of an air ingress accident which had been assessed in the HTTR safety analysis. The coated fuel particles were heated under a sufficient air flow in the temperature range of 900-1400 C for maximum duration of 600 h (at 1300 C). Failure fractions of the SiC coating layer after the heat treatments remained within the fraction at the fuel production. And the failure behavior of the SiC layer did not depend on such heating conditions as the temperature and the duration in the present experiment. It was confirmed by scanning electron microscopy (SEM), X-ray diffraction, and laser Raman spectroscopy that a thin oxide film was formed on the SiC layer by the heat treatments. DOE

MECHANICAL BEHAVIOUR OF A CLOSED COLLAR MODEL FOR AN 11.5 T DIPOLE
W. vanEmden, C. Daum, J. Geerinck, A. denOuden (Universiteit Twente, Enschede, Netherlands.), H. H. J. tenKate (Universiteit Twente, Enschede, Netherlands.), D. terAvest (Universiteit Twente, Enschede, Netherlands.), S. Wessel (HOLEC, Inc., Ridderkerk, Netherlands.), and R. Dubbeldam Mar. 1992 20 p
(NIKHEF-H/92-03; LHC-Note-181; ETN-93-93298) Avail: CASI HC A03/MF A01

A 10 cm long model of an 11.5 T Nb3Sn accelerator dipole magnet, with a closed ring shaped collar was constructed. A new collar design in which the prestress in the coil is achieved by shrink fitting a closed ring shaped collar around the coil package of each aperture is studied. Measurements of the collar deformation and the prestress at the poles are discussed. The finite element analysis of an 11.5 T Nb3Sn Large Hadron Collider dipole magnet equipped with closed collars around each aperture showed the applicability of this collar system. The shrinking process of the collars around the coils were repeated many times with the short dummy model and is expected to cause no problems in the assembly of a 1 m magnet. A systematic study of stresses and deformations inside the structure could be used to define the manufacturing tolerances of the various components. Studies of the effects of friction in the structural behavior were performed. For reasonable values of the friction coefficient between 0 and 0.6 major problems arise. From measurements in a short dummy model of the coil system it is concluded that measured and calculated deformations and stresses agree within limits imposed by manufacturing tolerances. The beam type strain gauge transducers are suitable for monitoring transverse stresses in the system provided a proper calibration procedure precedes their final mounting. ESA

STUDIES OF FLUCTUATION PROCESSES IN NUCLEAR COLLISIONS
S. Ayik Feb. 1993 18 p
(Contract DE-FG05-89ER-40530)
(DE93-011263; DOE/ER-40530/4) Avail: CASI HC A03/MF A01

Investigations of various aspects of heavy-ion collisions were carried out in the framework of the Boltzmann-Langevin Model (BLM). In a previous work, by projection of the BLM onto a collective space, a memory-dependent collective transport model was reduced. This model was applied to thermal fission to investigate the influence of the memory effects on the fission dynamics. Some results of the calculations are presented. In addition, a reduction of the relativistic BLM to a two-fluid model was carried out, and transport coefficients associated with fluid dynamical variables were derived. Then this model was applied to investigate equilibration and fluctuation properties in a counter-streaming nuclear fluid. DOE

PULSE CONTROL IN AN ACCELERATOR FOR HEAVY-ION FUSION
W. M. Sharp, J. J. Barnard, and S. S. Yu 1 Oct. 1992 5 p Presented at the 16th International LINAC Conference, Ottawa, Canada, 23-28 Aug. 1992
(Contract W-7405-eng-48)
(DE93-009527; UCRL-JC-110221; CONF-9208109-78) Avail: CASI HC A01/MF A01

In induction accelerators proposed for heavy-ion fusion, the ion beam is usually confined longitudinally by an axial electric field tailored to balance the space-charge field. Since generating such electric field 'ears' is costly and imprecise, it is important to know how frequently the ears must be applied and what errors in the waveform are tolerable. For practical parameters, cell breakdown is found to impose the principal limit on the spacing of the acceleration modules applying the ear field. Also, it is demonstrated that ear fields may be approximated in several ways by discrete field steps with little impairment of the longitudinal confinement. DOE

HIGH-ENERGY ELECTRON-POSITRON INTERACTIONS
S. S. Hertzbach and R. R. Kofler Mar. 1993 33 p
(Contract DE-AC02-85ER-40194)
(DE93-011611; DOE/ER-40194/6) Avail: CASI HC A03/MF A01

The purpose of the research was the study of electron-positron interactions at high energies using the Time Projection Chamber (TPC) at the Positron Electron Project (PEP) at SLAC. The TPC detector had an initial data gathering from 1982 until 1986 and accumulated a data sample with an integrated luminosity of -150 pb(exp -1) at an electron-positron energy of 29 GeV. The data runs in the 1988-1990 time period (yielding approximately pb(exp -1)) were abbreviated, due to the need of the laboratory to give highest priority to the new Stanford Linear Collider (SLC). The TPC collaboration decided in 1991 to discontinue data taking, but has continued the collaboration for the purpose of completing the analysis of the data. When UMass joined the SLD project, it was being designed as a new state-of-the-art detector for studying electron-positron interactions at energies in the vicinity of 91 GeV, the Z(sup 0) mass. The detector was completed and installed at the interaction point of the SLC in 1991, at which time an initial, 'engineering run' allowed the debugging of detector components and provided a data sample of approximately 1,000 events with hadronic Z(sup 0) decays. In 1992 the SLC provided beams of polarized electrons and the SLD collected a data sample in excess of 11,000 hadronic Z(sup 0) events produced by polarized electrons, allowing unique measurements of some of the parameters of the standard model. This project is continuing to take data in 1993 with increased polarization and higher luminosity. This report reviews the research work performed under the contract, and survey's the physics results. DOE

REQUIREMENTS FOR A SYSTEM TO ANALYZE HEP EVENTS USING DATABASE COMPUTING
E. May, D. Lifka, E. Lusk, L. E. Price, C. T. Day, S. Loken, J. F. MacFarlane, and A. Baden 1992 8 p Presented at the 12th IEEE Symposium on Mass Storage Systems, Monterey, CA, 25 Apr. 1993

(Contract W-31-109-eng-38)
(DE93-009960; ANL-HEP-CP-92-101; CONF-930461-3) Avail: CASI HC A02/MF A01

We describe the requirements for the design and prototyping of an object-oriented database designed to analyze data in high energy physics. Our goal is to satisfy the data processing and analysis needs of a generic high energy physics (HEP) experiment to be proposed for the Superconducting SuperCollider (SSC), and requires the collection and analysis of between 10 and 100 million sets of vectors (events), each approximately one megabyte in length. We sketch how this analysis would proceed using an object-oriented database which support the basic data types used in HEP. DOE

MULTIDIMENSIONAL INTERMITTENCY IN HADRONIC COLLISIONS
J. Pan and R. C. Hwa Jun. 1992 24 p
(Contracts DE-FG06-85ER-40224; DE-FG06-91ER-40637)
(DE93-010562; DOE/ER-40224/243; OITS-494) Avail: CASI HC A03/MF A01

The study of intermittency in high-energy hadronic collisions by the Monte Carlo code ECCO is extended to 3-dimensional phase space. Strong intermittency is found in agreement with the data. Fluctuation in the impact parameter is responsible for the intermittency in 1np(sub T), and the transverse-momentum conservation leads to negative intermittency slopes in the azimuthal angle (phi). The Ochs-Wosiek plots are linear in all dimensions having universal slopes. An exponent nu = 1.448 emerges to characterize multiparticle production in pp collisions. The properties of G moments are also examined, and the fractal dimensions determined. DOE

FLUCTUATIONS AND INTERMITTENCY IN HIGH ENERGY NUCLEUS-NUCLEUS COLLISIONS
B. Wosiek Feb. 1991 96 p
(DE93-608481; INP-1533/PH) Avail: CASI HC A05/MF A01 (US Sales Only)

Fluctuations of the particle densities in semi-central collisions of O-16, Si-28, and S-32 nuclei with heavy components of nuclear emulsion at different primary energies are studied. Various methods of data analysis have been used ranging from the examination of the structure in individual events to the study of the average factorial moments and conventional correlation functions. Emphasis is put on the analysis of the average factorial moments which appear to be the most efficient tool in searching for dynamical fluctuations. Unquestionable evidence for non-statistical fluctuations is found in O-16 and S-32 interactions with Ag/Br targets at 200 GeV/nucleon. Specifically, I observed larger deviations of individual pseudo-rapidity distributions from a smooth spectrum and more frequent occurrence of narrow spikes than expected from Monte Carlo simulations based on independent emission of secondary particles. Clear intermittency signals are found in pseudo-rapidity and azimuthal angle distributions. The intermittency effect is also observed in two dimensions, where it has turned out to be stronger and cleaner than in one-dimensional distributions. Multiplicity distributions in the restricted phase space domains are well described by the negative binomial formula and consequently it was found that factorial moments can be equivalently obtained from the parameters of the negative binomial fits. On the other hand, investigation of the two-particle correlation functions in pseudorapidity provides no supporting evidence for pronounced non-statistical correlations. The occurrence of large particle-density fluctuations is expected in the presence of phase transition in ultrarelativistic nuclear collisions. Even though the obtained results can not be unambigously interpreted as an indication for quark-gluon plasma formation, they clearly show that some collective effects are present in high energy nucleus-nucleus collisions. The result of discussing conversion of time sequential information (electric signals) into two-dimensional optical information, and optical computation using a Pockels readout optical modulator (PROM) is reported. The following is described: operation to polarize light beams by means of input electric signals using two ultrasonic beam polarizing elements and make two-dimensional patterns; operation to write information into the PROM using short wave length beams and read out the information using long wave length beams; and the principle of optical computation using a system with two PROM's and three polarizing elements arranged in front and rear of the system. An optical computation experimental equipment was used that comprises an optical system including the above elements, a writing light source, a reading out light source, and lenses, and a shutter and controls. The experiment verified that two-dimensional light patterns that correspond to time sequential information are written into the PROM, and the optical computation is executed with the readout beams that pass through the PROM. Additionally, the applicability of this optical computation to measuring and controlling systems is described. DOE

FIBER GRATING-BASED SENSING SYSTEM WITH INTERFEROMETRIC WAVELENGTH-SHIFT DETECTION Patent Application
Alan D. Kersey, inventor (to Navy) and T. A. Berkoff, inventor (to Navy) 4 Nov. 1992 32 p
(AD-D015697; US-Patent-Appl-SN-971117; Navy-Case-74106) Avail: CASI HC A03/MF A01

A typical fiber grating-based strain sensing system for sensing a measurand field according to the prior art comprises an optical source for providing broadband light to an array of serially coupled sensor elements. Each sensor element returns an optical signal having a narrow-band wavelength component, the wavelength depending by a known functional relation on the measurand field being sensed. The measurand field is a particular environmental condition or physical phenomenon under consideration. In other words, perturbation of that condition or phenomenon at element results in a change of the wavelength of optical signal. The array combines the individual signals, such as by wavelength-division or time-division multiplexing, to produce a composite return signal having a plurality of components, each uniquely corresponding to a signal from an individual sensor element. ULTRA-HIGH RESOLUTION WATER WINDOW X RAY MICROSCOPE OPTICS DESIGN AND ANALYSIS Final Report, 18 Mar. 1992 - 17 Jun. 1993
David L. Shealy and C. Wang 25 Jun. 1993 36 p
(NASA Order H-13006-D)
(NASA-CR-193225; NAS 1.26:193225) Avail: CASI HC A03/MF A01

This project has been focused on the design and analysis of an ultra-high resolution water window soft-x-ray microscope. These activities have been accomplished by completing two tasks contained in the statement of work of this contract. The new results from this work confirm: (1) that in order to achieve resolutions greater than three times the wavelength of the incident radiation, it will be necessary to use spherical mirror surfaces and to use graded multilayer coatings on the secondary in order to accommodate the large variations of the angle of incidence over the secondary when operating the microscope at numerical apertures of 0.35 or greater; (2) that surface contour errors will have a significant effect on the optical performance of the microscope and must be controlled to a peak-to-valley variation of 50-100 A and a frequency of 8 periods over the surface of a mirror; and (3) that tolerance analysis of the spherical Schwarzschild microscope has been shown that the water window operations will require 2-3 times tighter tolerances to achieve a similar performance of operations with 130 A radiation. These results have been included in a manuscript included in the appendix. Author (revised)

All adaptive optics systems incorporate devices designed to measure and compensate phase distortions that accumulate over the propagation path of an optical beam. Measurement of the wavefront is accomplished with the aid of a bright source, or beacon, which must be accurately positioned along the beampath. In some scenarios of interest no physical beacon exists; for instance, the propagation of a laser beam to an exoatmospheric object moving at velocity upsilon requires that the beacon lead the target by an angle 2 v/c. In the early 1980's it was proposed that laser backscatter in the atmosphere might provide a suitable alternative source in such cases. Although a synthetic beacon generated in this manner can be placed arbitrarily in angle, any range discrepancy between the target and the beacon can lead to a form of measurement error known as focal anisoplanatism. Lincoln Laboratory's SWAT (Short-Wavelength Adaptive Techniques) program was initiated in 1983 to provide experimental verification of the most promising synthetic beacon concepts and to quantify the magnitude of the associated focal anisoplanatic errors. The test plan for this program includes passive imaging experiments using single and binary stars, as well as active experiments in which a scoring beam will be projected to rocket and satellite targets. SWAT LABORATORY TEST RESULTS Project Report
Ronald R. Parenti and Daniel V. Murphy 10 Mar. 1993 46 p Revised
(Contract F19628-90-C-0002)
(AD-A262906; PR-SWP-6-Rev-1; ESC-TR-92-143-Rev-1) Avail: CASI HC A03/MF A01

The non-cooperative-target beam-control problem has been the subject of intense investigation since the synthetic-beacon concept was first introduced to the high-energy-laser community in 1982. While numerous analytical studies and computer simulations have been performed to evaluate the practical utility of this phase-measurement technique, prior to Lincoln Laboratory's SWAT (Short-Wavelength Adaptive Techniques) program, no experimental verification had been obtained. In the first phase of the SWAT investigation, completed in 1985, a high degree of correlation between differential-phase measurements from natural and artificial sources was demonstrated. The next phase of the SWAT program will be performed at the AMOS (Air Force Maui Optical Station) facility in Maui, where a 241-actuator adaptive-optics system and an array of six dye lasers will be integrated with the site's 60-cm beam director. Prior to shipment, the adaptive-optics subsystem was subjected to a thorough laboratory evaluation, which culminated in a series of compensation tests involving simulated beacon sources. The results of these measurements are in good agreement with theoretical predictions and provide strong evidence of the efficacy of the synthetic-beacon approach. DTIC

VISION-BASED CONTROL OF HOLONOMIC ROBOTS FOR 3-DIMENSIONAL RIGID-BODY POSITIONING USING CAMERA-SPACE MANIPULATION Ph.D. Thesis
Wenzong Chen 1993 164 p
Avail: Univ. Microfilms Order No. DA9308222

Camera-space manipulation was developed in this work for 3-dimensional 6-degree-of-freedom rigid-body positioning tasks with unknown work piece position and orientation. Using standard imaging devices and the very large GMF S-400 manipulator, highly precise manuever precision was achieved with negligible passive compliance. The maneuver succeeded consistently within a large range of work piece position and orientation provided the piece remained in the cameras' fields of view. The maneuver precision was further improved by accounting for the perspective effect in the camera-space locations of visually-detected cues painted on the objects to be positioned, using an iterative procedure that we devised in this work. The application of this procedure also increased the range of the work piece position and orientation within which the maneuver succeeded consistently. Also developed in this work was an iterative method for the estimation for grasp uncertainty in rigid-body positioning with camera-space manipulation. This added capability of camera-space manipulation allowed rigid-body positioning tasks to be accomplished with both unknown work piece position and orientation and unknown grasp. Dissert. Abstr.

OPTICAL COHERENT PHASE DIVERSITY SYSTEMS Ph.D. Thesis
Willibrordus Hubertu deKrom 1992 191 p
(ISBN-90-9004897-9; ETN-93-93580) Copyright Avail: CASI HC A09/MF A02

The calculation and specification of necessary system parameters and component tolerances for an optical coherent phase diversity receiver was studied with respect to the development of receivers for broadband communications. By means of mathematical models, phase diversity receivers of interest were analyzed in terms of the bit error rate as a function of the signal to noise ratio. The application of phase diversity techniques has several advantages which are explained. Special attention was paid to the influence and reduction of different system imperfections. Restriction to the following most promising digital modulation formats was made: Amplitude Shift Keying (ASK); Differential Phase Shift Keying (DPSK); Frequency Shift Keying (FSK); and Continuous Phase Frequency Shift Keying (CPFSK). Polarization maintaining pigtailed laser diodes have greatly increased the ease with which fiber-optic sensors for Faraday current measurements on large pulsed experiments can be deployed. 670, 830, and 1300 nm units are readily available. Such diode lasers can easily be mounted in an RF shielded box along with the simple electronics and batteries to power them. Our units measure 16.5 x 8 x 6 cm. and have a single external control; an on off switch. They use two 1.5 volt C cell batteries. By using an LT1073 chip in the electronics, the batteries are an energy source rather than a voltage source. These units can provide 100 mA drive to a LT015MD laser diode so that 1 mW of 830 nm light exits the fiber pigtail for up to 23 hours with no detectable droop in power. For the sensor element, twisted single mode low birefringence fibers are wrapped around the region of interest. The fiber pigtail is fused to the sensor section so changes in alignment are avoided. The light exiting the fiber sensor section is immediately analyzed by a compact, 3 x 3.5 x 5 cm, bulk optical unit which outputs quadrature optical signals into two multimode fibers leading to detectors in a screen room. The system is thus completely free of ground loops and is as immune to noise as the screen room. These sensors have the usual advantages claimed for them and the all dielectric feature was the original reason for their use on our experiments. The ease of deployment however is not usually cited. On our Pegasus 2 experiment, the need arose for a total current measurement at the main header of the capacitor banks. A single turn of optical fiber was easily strung in a 6.4 m diameter circle and attached to laser and analyzer in a few hours. DOE

SWAT SYSTEM PERFORMANCE PREDICTIONS Project Report
Ronald R. Parenti and Richard J. Sasiela 10 Mar. 1993 103 p Revised
(Contract F19628-90-C-0002)
(AD-A262857; PR-SWP-8-Rev-1; ESC-TR-92-144-Rev-1) Avail: CASI HC A06/MF A02

In the next phase of Lincoln Laboratory's SWAT (Short-Wavelength Adaptive Techniques) program, the performance of a 241-actuator adaptive-optics system will be measured using a variety of synthetic-beacon geometries. As an aid in this experimental investigation, a detailed set of theoretical predictions has also been assembled. The computational tools that have been applied in this study include a numerical approach in which Monte-Carlo ray-trace simulations of accumulated phase error are developed, and an analytical analysis of the expected system behavior. This report describes the basis of these two computational techniques and compares their estimates of overall system performance. Although their regions of applicability tend to be complementary rather than redundant, good agreement is usually obtained when both sets of results can be derived for the same engagement scenario. SPATIAL LIGHT MODULATORS (SLMs) SURFACE QUALITY Final Technical Report, 1 Jun. - 1 Sep. 1992
Tracy D. Hudson Mar. 1993 17 p
(AD-A263249; AD-E952004; AMSMI/TR-RD-WS-93-3) Avail: CASI HC A03/MF A01

The phase modulating properties of spatial light modulators (SLM's) were investigated for optical pattern recognition purposes for many years. An interferometric microscope was recently utilized to investigate the surface uniformity, and thus phase distortion, of several SLM's that are commercially available. These interferometric results are presented and verify that the optical uniformity of SLM's should be considered when phase modulating properties of the devices are to be applied in optical systems. BINOCULAR SPHERICAL DISPARITY: A STUDY IN REPRESENTATION FOR A FORWARD TRANSLATING CAMERA
D. J. Orser Jun. 1992 136 p
(PB93-184422; NISTIR-4865) Avail: CASI HC A07/MF A02

The problem of interpreting optical flow and binocular disparities for a forward translating camera is addressed. A solution is offered in the form of image remappings which convert the images to the analogous well understood case for a laterally translating camera. After reviewing this latter case, a binocular camera-retina imaging model utilizing spherical projection and foveal peripheral resolution is described for analyzing both binocular disparity and optical flow. The result provides the basis for analyzing both types of disparities within a single framework for the purpose of understanding how these 'orthogonal' sources of information can be exploited in a computational model. The process of image remapping, called 'normalization,' is then defined for four 1-D parameterizations of 3-D space: range, depth, looming and clearance. It is shown that normalization transforms optical flow into a form analogous to that for the laterally translating camera. In addition, it is shown how to obtain these same normalizations from standard planar projection images. A binocular wire frame scene simulator is used to experimentally verify the ideas. In addition a program for normalizing real iconic planar projection imagery is applied to several example images and the results demonstrated. NTIS

WHAT IS THE CENTER OF THE IMAGE?
Reg G. Willson and Steven A. Shafer Apr. 1993 27 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A263550; CMU-CS-93-122) Avail: CASI HC A03/MF A01

People need to calibrate camera systems in order to determine the relationship between the positions of features in object space and their corresponding positions in the image. Part of camera calibration is the determination of image center. But, what is the image center? Ideally, the image center is considered to be the point of intersection of the camera's optical axis with the camera's sensing plane. In fact there are many possible definitions of image center, and in real lenses most do not have the same coordinates. In addition, the image centers move as lens parameters are changed. In this paper, we examine why image centers are not necessarily the same for different image properties and why they vary with lens parameter's. We then provide a taxonomy of 16 different image centers and describe procedures for measuring them. Finally, we examine the calibration of image center for a variable parameter lens. Several techniques are applied to a precision automated zoom lens and experimental results are shown. We conclude that the accuracy of the image center can be an important factor in the accuracy of the overall camera calibration, and that the large variation in the position of the image center across different definitions and different lens settings makes the calibration problem much more complex than is conventionally believed. With proper modeling, by using correct definitions for all image centers in a system, we can improve the accuracy of our camera calibration. DTIC

APPLICATION OF SCHLIEREN OPTICAL TECHNIQUES FOR THE MEASUREMENT OF GAS TEMPERATURE AND TURBULENT DIFFUSIVITY IN A DIESEL ENGINE
Roberto P. Giangregorio, Yuanxian Zhu, and Rolf D. Reitz 5 Mar. 1993 17 p
(Contract DAAL03-86-K-0174)
(AD-A263810; ARO-24623.125-EG-UIR) Avail: CASI HC A03/MF A01

A new technique which is based on optoacoustic phenomena has been developed for measuring in-cylinder gas temperature and turbulent diffusivity. In the experiments, a high energy Nd:YAG pulsed laser beam was focused to cause local ionization of air at a point in the combustion chamber. This initiates a shock wave and creates a hot spot. The local temperature and turbulent diffusivity are determined by monitoring the shock propagation and the hot spot growth, respectively, with a Schlieren photography system. In order to assess the validity and accuracy of the measurements, the technique was also applied to a turbulent jet. The temperature measurements were found to be accurate to within 3 percent. Results from the turbulent jet measurements also showed that the growth rate of the hot spot diameter can be used to estimate the turbulent diffusivity. DTIC

MEASUREMENTS OF LIGHT SCATTERING BY SMALL PARTICLES AT AN ANGLE OF ZERO DEGREES Final Report, 1 Jul. - 30 Nov. 1992
Edward S. Fry 28 Jan. 1993 5 p
(Contract DAAL03-92-G-0296)
(AD-A263856; ARO-30495.3-GS) Avail: CASI HC A01/MF A01

We recently demonstrated an innovative new idea that permits light scattering measurements at an angle of 0 deg for the first time. The idea is based on the use of coherent beam coupling in a nonlinear, photorefractive crystal of BaTiO3 to separate the scattered light from the unscattered direct beam. The present problem is to extend these ideas to the following: (1) angular distribution measurements; (2) measurements of the phase as well as the amplitude (i.e. both real and imaginary parts) of the 0 deg scattering; and (3) determination of the effects of coherent scattering at 0 deg. We have successfully measured the angular distribution of forward light scattering from quartz fibers of radii from 15 mm to 30 mm. Data have been obtained in the angular range of 0 deg to 0.3 deg with an angular resolution of better than 0.01 deg. The results are in good agreement with theory. Finally, the existence of coherent scattering effects at zero degrees have been considered and analyzed theoretically. Experimental data were obtained that confirm these coherent scattering affects in suspensions of polystyrene spheres. DTIC

OPTOELECTRONIC TECHNOLOGY CONSORTIUM Quarterly Technical Report No. 2
Mary Hibbs-Brenner 31 Dec. 1992 9 p
(Contract MDA972-92-C-0071; ARPA Order 8351)
(AD-A263580) Avail: CASI HC A02/MF A01

The Optoelectronics Technology Consortium has been established to position U.S. industry as the world leader in optical interconnect technology by developing, fabricating, intergrating and demonstrating the producibility of optoelectronic components for high-density/high-data-rate processors and accelerating the insertion of this technology into military and commercial applications. This objective will be accomplished by a program focused in three areas. (1) Demonstrated performance: OETC will demonstrate an aggregate data transfer rate of 16 Gbit/s between single transmitter and receiver packages, as well as the expandability of this technology by combing four links in parallel to achieve a 64 Gbit/s link. (2) Accelerated development: By collaborating during precompetitive technology development stage, OTEC will advance the development of optical components and produce links for a multiboard processor testbed demonstration; and (3) Producibility: OETC's technology will achieve this performance by using components that are affordable, and reliable, with a line BER less than 10(exp -15) and MTTF greater than 10(exp 6) hours. APPLICATIONS OF THE PHOTOREFRACTIVE EFFECT AND DAMAGE INDUCED EFFECTS IN FIBERS Final Report, 1 Mar. 1990 - 31 Oct. 1992
Dana Z. Anderson 31 Oct. 1992 34 p
(Grant AF-AFOSR-0198-90)
(AD-A264339; AFOSR-93-0247TR) Avail: CASI HC A03/MF A01

The focus of this report is two-fold. One aspect concerns photoinduced effects in fibers, especially the processes of self-organized second-harmonic generation in fibers. For the most part we have developed the microscopic theory of defect formation in glass. The basic physics involved in second-harmonic generation in fibers has to led to a number of other possible experiments and applications. For example it is known that a photogenerated current cannot be produced by a single optical beam illuminating a centrosymmetric medium but it is now recognized that a current can be generated in a centrosymmetric medium by illumination with two harmonically related optical fields. However, we have concluded that as an application, self-organized second-harmonic generation in fibers does not appear to be a practical means of frequency doubling conventional lasers. Thus until a conceptual or practical breakthrough occurs, we have brought to a close the experimental and theoretical work on this subject. DTIC

In the first year of this grant, progress was made on two major series of experiments. In the first, the effect of noise, brightness, contrast, and geometrical artifacts on a detection task simulating enhanced night vision devices in a series of 10 experiments were examined. An article was submitted based on this study. In the second, the effects of noise, Fourier filtering, reduced acuity (by means of blocking), and combinations thereof in a discrimination task were explored. Ten experiments also were carried out in this series and were analyzed and a publication is being prepared. DTIC

POLARIZATION MODULATED ELLIPSOMETRY Final Report
James L. Lauer and Norbert Marxer Washington Sep. 1986 113 p
(Grant NAG3-222; RTOP 505-63-01)
(NASA-CR-4012; E-3173; NAS 1.26:4012) Avail: CASI HC A06/MF A02

For the investigation of the composition and thickness of thin nonuniform films on bearing and other tribological surfaces an automated ellipsometer was built, which is extremely sensitive to relative changes in thickness and composition of surface films. These changes can be seen by scanning across the surface with 20 micron lateral resolution. By measuring at different angles of incidence, one can determine the film thickness and identify the material of the film by its complex index of refraction. For the analysis of organic layers on top of several metallic layers, it was necessary to develop mathematical procedures to increase the absolute precision of the instrument. The ellipsometer is described in detail, and the precision is discussed. The actual performance of the ellipsometer was tested on three experiments. In the first one, the composition and thickness of patches of an oxide film inside a wear track were determined. In the third, the thickness of silicon oxide on top of a silicon substrate was found. Important features of this apparatus are (1) accurate settings of the polarization stages and the angle of incidence (both animated), (2) high precision in the determination of the ellipsometric parameters without calibration prior to an experiment, and (3) very accurate scanning modes with high spatial resolution. The instrumentation and the mathematical procedures were developed here for the first time. Author (revised)

METHOD AND APPARATUS FOR IMAGING AN OBJECT IN OR THROUGH A SCATTERING MEDIUM BY USING MULTIPLE-WAVE MIXING Patent Application
Mark Bashkansky, inventor (to Navy) and John F. Reintjes, inventor (to Navy) 30 Nov. 1992 24 p
(AD-D015707; US-Patent-Appl-SN-983334; Navy-Case-74287) Avail: CASI HC A03/MF A01

This patent application discloses a method and apparatus for imaging an object that is part of, embedded in, or view through a scattering medium. A broadband stochastic beam generator, such as a broadband laser, generates a broadband stochastic beam and a narrowband beam generator generates a narrowband beam. A non-linear mixing crystal receives the broadband stochastic beam and the narrowband beam and provides a signal light beam conjugate correlated with the broadband stochastic beam to scattering medium. A multiple-wave mixing call is disposed to receive the signal light beam from scattering medium. An adjustable delay path also illuminates the multiple-wave mixing cell with the broadband stochastic beam. A supplemental beam generator is also provided for also additionally illuminating the multiple-wave mixing cell with a supplemental beam having characteristics sufficient to satisfy phase matching with the material of the multiple-wave mixing cell. The multiple-wave mixing cell produces an image-bearing beam which contains an image of an object extracted from signal light beam emitted from the scattering medium. The apparatus can further include a detector to record the image of the object in the object in the image-bearing beam. DTIC

INFRARED IMAGING ARRAY INTEGRATED IN THREE DIMENSIONS DIRECTLY ON TOP OF SILICON CIRCUITS
M. Brooke, N. Jokerst, M. Allen, and S. DeWeerth May 1993 24 p
(AD-A264707) Avail: CASI HC A03/MF A01

We have demonstrated the first three dimensional integration of a high quality compound semiconductor infrared imaging detector array directly on top of a foundry-produced silicon neuromorphic image processing circuit. There is great potential for this new technology in neuromorphic image processing applications. This new ability to construct complex locally connected neuromorphic focal-plane processors with direct massively parallel connections to high quality compound semiconductor imaging arrays will lead to new levels of sophistication in focal-plane processing. During this research, thin film p-i-n and metal-semiconductor-metal (MSM) detectors were fabricated and tested. A four-by-four array of detectors was integrated onto a metallized silicon substrate and directly on top of an array of silicon circuits. The yield of each of these arrays was 100%, i.e., every detector was functional, and, in the integration onto silicon circuitry, every circuit underneath the detectors was also functional. DTIC

David M. Bloom Jan. 1993 131 p
(Contract F49620-92-J-0099)
(AD-A264635; AFOSR-93-0258TR) Avail: CASI HC A07/MF A02

The electro-optic sampling system developed under AFOSR contract no. F49620-85-0016 has been the workhorse for high speed measurements made in this lab. This report documents the continuing effort to improve this tool and highlights its most recent uses. In addition, we report the development of a time-lens, a new tool that gives us electronic control of the shape of optical pulses. The development of a time-lens has opened up a new field of research. It is a tool to electronically control the temporal characteristics of optical pulses just like glass lenses control the spatial characteristics. Our results to date include the creation of 7 ps pulses from a CW laser, active focusing (compression) of 55 ps pulses down to 2 ps, and demonstration of the time-reversal properties of time-lenses. A Ph.D. thesis detailing the Stanford time-lens and pulse compression experiments is included as an appendix. DTIC

We describe a program which endeavors to make significant progress towards the realization of very high density, fast, InP-based optoelectronic spatial light modulators (SLM's). The central concept of the devices is to eliminate as many contacts to the SLM as possible by supplying integral, local circuit power, and control via the connection of the active circuit to integrated photovoltaic (PV) cells. Power to the circuits is thereby supplied by a bright light source operating at a different wavelength than the optical data channel. The SLM will be fabricated in InP-based materials due to the ease of integration of photovoltaic cells (used in providing circuit power and control), with high bandwidth transceiver optoelectronic integrated circuits (OEIC's). Work includes materials and device fabrication, packaging and systems demonstrations. In addition to applications in optical interconnection and optical computing, such contactless circuit concepts can also be applied to many diverse systems such as for providing highly synchronous optical clock signals on VLSI chips, and for powering OEIC's placed at the end of remote probes where size, power, and environmental restrictions prohibit the placement of the power source adjacent to the active electronics. We are engaged in a broad program directed at investigating the fundamental limits confronting materials, devices, circuits, and systems which make use of the family of novel devices which are based on the optical powering concept. A new optical parallel arithmetic processing scheme using a nonholographic optoelectronic content-addressable memory (CAM) was proposed. The design of a four-bit CAM-based optical carry look-ahead adder was studied. Compared with existing optoelectronic binary addition approaches, this nonholographic CAM Scheme offers a number of practical advantages, such as faster processing speed and ease of optical implementation and alignment. For an addition of numbers longer than four bits, by incorporating the previous stage's carry, a number of four-bit CLA's can be cascaded. Experimental results were also demonstrated. One paper to the Optics Letters was published. DTIC

OPTICAL SYSTEM ANALYSIS FOR THE GROUND BASED EXVM Final Report
L. W. Hillman, R. A. Chipman, and M. H. Smith 30 Jun. 1993 88 p
(Contract NAS8-38609)
(NASA-CR-192588; NAS 1.26:192588) Avail: CASI HC A05/MF A01

The MSFC's Experimental Vector Magnetograph (EXVM) is an instrument that observes a 4.4 x 8.8 arcmin field of the sun. The transverse and longitudinal components of the surface magnetic field and the line-of-sight velocities of the photospheric gases can be determined from polarimetric and spectral analysis of the 525.02 nm absorption line of Fe 1. The EXVM has been breadboarded and tested in the laboratory. The optics of the EXVM were tested with a point-diffraction (Smartt) interferometer. The 12 inch Cassegrain telescope was found to have 0.20 waves RMS (at 525.02 nm) of aberration. The post-telescope relay optics were nearly diffraction limited on-axis and had about one wave of primary coma as the predominant aberration at full-field. From theoretical modulation transfer function (MTF) curves of known aberrations, it was concluded that the EXVM should attain a maximum spatial resolution of about 0.5 arcseconds. A resolution test target indicated maximum angular resolutions better than 0.6 arcsec on-axis and 0.7 arcsec at full-field-of-view. A 20 inch heliostat (sun-tracking mirror) was used to direct sunlight into the lab and into the EXVM. Solar images obtained were limited by atmospheric seeing effects. During brief moments of good seeing, angular resolutions of about 1 arcsecond were realized with the EXVM. Author (revised)

JT-60 UPGRADE VERTICAL STABILITY EXPERIMENTS AND ANALYSIS
D. A. Humphreys and Ryuji Yoshino May 1992 31 p
(DE93-753131; JAERI-M-92-069) Avail: CASI HC A03/MF A01

The JT-60 Upgrade tokamak (JT-60U), can produce plasmas with vertical elongation (kappa approximately = 1.6), and thus allows investigation of vertical instability phenomena. The present work describes investigation of the vertical stability characteristics of JT-60U plasmas through experimental results and simulation. Experiments described include feedback turnoff cases and high beta(sub p) unstable plasma cases. For purposes of simulation, the plasma is modeled as a rigid assembly of current-carrying axisymmetric loops. A nominal conductor model based on design geometry was modified to reproduce the results of a series of coil excitation experiments using a reduced order system identification approach. A two-coil model was used to fit the experimental coil excitation behavior, and the full order conductor model was modified to allow the dominant modes to reflect the low order dynamic response. The resulting plasma-conductor model is shown to reproduce the vertical stability behavior of JT-60U fairly well. Theoretical predictions of limits on the value of Shafranov (Lambda) achievable in JT-60U are made. DOE

EDGE PLASMA CONTROL BY RF ELECTRIC FIELD IN COMPACT HELICAL SYSTEM (CHS)
T. Shoji, A. Sagara, and N. Noda May 1992 19 p
(DE93-753242; PSC-18) Avail: CASI HC A03/MF A01

Reducing plasma heat flux on the material limiter and stabilizing fluctuations at the plasma boundary by the use of an RF ponderomotive potential barrier on the limiter (RF limiter) have been demonstrated in Compact Helical System (CHS) for ECH heated plasma. The RF current on a graphite limiter surface along magnetic field lines produces a ponderomotive potential barrier, which is large at the limiter edges. The high heat load on the limiter edges, which is measured using a infrared TV camera, has been shown to be reduced by an RF power of 1.4 kW at the frequency 10 MHz (omega(sub ci) less than omega much less than omega(sub ce)). Another remarkable effect of the ponderomotive potential barrier on the limiter that has been observed is the suppression of density fluctuations (less than 100 kHz) at the plasma boundary. DOE

OBSERVATION OF A BEAM ENERGY SHIFT CAUSED BY A PLASMA WAKEFIELD

A. Ogata, A. Enomoto, K. Nakajima, H. Nakanishi, Y. Suetsugu, T. Shoji, Y. Nishida, and N. Yugami Jun. 1992 15 p
(DE93-753243; PSC-20) Avail: CASI HC A03/MF A01

The energy shifts of linac electron beams caused by a plasma wakefield were measured in plasmas with a density on the order of 10(exp 12)/cc. The linac provided a sequence of several bunches which generated a wakefield in the plasma. The wakefield, in turn, caused an energy change in the bunches. Data processing took account of the finite bunch length, which was comparable or even longer than the plasma wavelength. It shows that the observed wakefield, if converted into the values at the bunch center, amounted to approx. 20 MeV/m in certain cases. The energy spectra were qualitatively consistent with the calculations. No buildup of the wakefield was obvious after the maximum bunch. DOE

N93-28535# Japan Atomic Energy Research Inst., Tokyo.
MEASUREMENTS OF BREAKAWAY REACTION BETWEEN BERYLLIUM AND WATER VAPOR FOR ITER BLANKET DESIGN
Hiroshi Yoshida, Mikio Enoeda, Kusuo Ashibe, and Kiyoshi Ono Jun. 1992 35 p
(DE93-753270; JAERI-M-92-083) Avail: CASI HC A03/MF A01

Beryllium will be utilized as the neutron multiplier in the ITER breeding blanket. As part of Japanese contribution of the water-cooled blanket design, preliminary study was performed to investigate beryllium breakaway reaction, which is one of safety issues of ITER under high temperature conditions. Thermogravimetric measurements in the temperature range 550 - 750 C were carried out under helium gas flow containing water vapor of 7.6 and 0.76 Torr. The test samples were prepared from commercially available hot-pressed and hot-rolled beryllium plates. Characterization of the surface reaction product was performed by macro and microscopic observations, and x-ray diffraction analysis. Linear and parabolic rate laws were found for the dominant reaction steps in the preceding period of the breakaway reaction. Microstructure of the surface reaction layer formed in all exposure conditions revealed brittle structure, which was composed of blister and microcracks. The rate equations were obtained for the preceding step of breakaway reaction. DOE

NEW REMOTE MAINTENANCE APPROACH FOR TPX
F. C. Davis, M. S. Walker, and T. G. Brown (Princeton Univ., NJ.) 1993 5 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-007857; CONF-930403-23) Avail: CASI HC A01/MF A01

The Tokamak Physics Experiment (TPX), to be located at Princeton Plasma Physics Laboratory, will be a steady-state, high-performance fusion machine. It will use hydrogen fuel during its original operation, deuterium-deuterium (D-D) fuel for an extended intermediate period of time and then a limited number of runs using deuterium-tritium (D-T) fuel. The D-D operations will generate neutron fluxes that will activate materials of the vacuum vessel. From that point on, the resulting ionizing radiation, which will continue to increase, particularly during D-T operation, will prevent personnel access into the vessel to perform either scheduled or unscheduled maintenance activities. All activities performed within the vacuum vessel must be accomplished using remote means. TPX has taken a new approach for remote maintenance of the components within the vacuum vessel. This document describes the system that is being developed. DOE

A FOKKER-PLANCK OPERATOR FOR THE EMISSION AND ABSORPTION OF ELECTRON PLASMA WAVES IN A MAGNETIZED PLASMA
A. A. Ware Mar. 1993 25 p
(Contract DE-FG05-80ET-53088)
(DE93-009579; DOE/ET-53088/590; IFSR-590) Avail: CASI HC A03/MF A01

For slab geometry the perturbation of the electrostatic wake of a superthermal test electron in a magnetized plasma (omega(sub ce) much greater than omega(sub pe)) due to moderate magnetic shear is determined. Allowing for the spherical symmetry of the surfaces of constant phase to the rear of the test electron, the 'resonant' field electrons causing the damping of the wave in a magnetic surface at a distance x from the test electron are those with parallel velocity upsilon'(parallel) = upsilon(parallel) cos(beta) / cos(beta + gamma). Here beta is the angle between the emitted ray and B(0), gamma is the angle between B(0) and B(x) and upsilon(parallel) is the velocity of the test electron. As a result the damping in the WKB approximation for the wave emission is a function of both the angle of emission and gamma. A Fokker-Planck equation is derived for the rate of change of the electron distribution function (f) due to the emission and absorption of the waves under these conditions. F is assumed approximately Maxwellian for upsilon(parallel) greater than upsilon(sub T). DOE

N93-28599# Texas Univ., Austin. Inst. for Fusion Studies.
SELF-CONSISTENT CHAOS IN THE BEAM-PLASMA INSTABILITY
J. L. Tennyson (Stanford Linear Accelerator Center, CA.), J. D. Meiss (Colorado Univ., Boulder.), and P. J. Morrison Feb. 1993 37 p
(Contract DE-FG05-80ET-53088)
(DE93-009581; DOE/ET-53088/587; IFSR-587) Avail: CASI HC A03/MF A01

The effect of self-consistency on Hamiltonian systems with a large number of degrees-of-freedom is investigated for the beam-plasma instability using the single-wave model of O'Neil, Winfrey, and Malmberg. The single-wave model is reviewed and then rederived within the Hamiltonian context, which leads naturally to canonical action-angle variables. Simulations are performed with a large (10(sup 4)) number of beam particles interacting with the single wave. It is observed that the system relaxes into a time asymptotic periodic state where only a few collective degrees are active; namely, a clump of trapped particles oscillating in a modulated wave, within a uniform chaotic sea with oscillating phase space boundaries. Thus self-consistency is seen to effectively reduce the number of degrees-of-freedom. A simple low degree-of-freedom model is derived that treats the clump as a single macroparticle, interacting with the wave and chaotic sea. The uniform chaotic sea is modeled by a fluid waterbag, where the waterbag boundaries correspond approximately to invariant tori. This low degree-of-freedom model is seen to compare well with the simulation. DOE

NONLINEAR COUPLING OF TEARING FLUCTUATIONS IN THE MADISON SYMMETRIC TORUS
J. S. Sarff, A. F. Almagri, M. Cekic, D. J. DenHartog, G. Fiksel, S. A. Hokin, H. Ji, S. C. Prager, W. Shen, and M. R. Stoneking et al Nov. 1992 24 p Presented at the Meeting of the Division of Plasma Physics of the American Physical Society, Seattle, WA, 16-20 Nov. 1992
(Contract DE-FG02-85ER-53198)
(DE93-010131; DOE/ER-53198/211; CONF-921103-9) Avail: CASI HC A03/MF A01

Three-wave, nonlinear, tearing mode coupling has been measured in the Madison Symmetric Torus (MST) reversed-field pinch (RFP) using bispectral analysis of edge magnetic fluctuations resolved in 'k-space.' The strength of nonlinear three-wave interactions satisfying the sum rules m(sub 1) + m(sub 2) = m(sub 3) and n(sub 1) + n(sub 2) = n(sub 3) is measured by the bicoherency. In the RFP, m = 1, n approximately 2R/a (6 for MST) internally resonant modes are linearly unstable and grow to large amplitude. Large values of bicoherency occur for two m = 1 modes coupled to an m = 2 mode and the coupling of intermediate toroidal modes, e.g., n = 6 and 7 coupled to n = 13. These experimental bispectral features agree with predicted bispectral features derived from MHD computation. However, in the experiment, enhanced coupling occurs in the 'crash' phase of a sawtooth oscillation concomitant with a broadened mode spectrum suggesting the onset of a nonlinear cascade. DOE

NONLINEAR DYNAMICS AND PLASMA TRANSPORT
T. M. Antonsen, Jr., J. F. Drake, J. M. Finn, P. N. Guzdar, A. B. Hassam, and R. Z. Sageev 1993 15 p
(Contract DE-FG05-89ER-53301)
(DE93-012238; DOE/ER-53301/2) Avail: CASI HC A03/MF A01

This progress report details work done on a program in nonlinear dynamical aspects of plasma turbulence and transport funded by DOE since 1989. This program has been in cooperation with laboratories in the USSR (now Russia and the Confederation of Independent States (CIS)). The purpose of this program is as follows: To promote the utilization of recent pathbreaking developments in nonlinear science in plasma turbulence and transport; and to promote cooperative scientific investigations between the U.S. and CIS in the related areas of nonlinear science and plasma turbulence and transport. In the work reported in our progress report, we have studied simple models which are motivated by observation on actual fusion devices. The models focus on the important physical processes without incorporating the complexity of the geometry of real devices. This allows for a deeper analysis and understanding of the system both analytically and numerically. DOE

N93-28836# General Atomic Co., San Diego, CA.
INERTIAL CONFINEMENT FUSION TARGET COMPONENT FABRICATION AND TECHNOLOGY DEVELOPMENT SUPPORT Report, 1 Jan. 1991 - 30 Sep. 1992
D. Steinman, ed. Mar. 1993 114 p
(Contract DE-AC03-91SF-18601)
(DE93-010836; GA-A-21203) Avail: CASI HC A06/MF A02

On December 31, 1990, the U.S. Department of Energy entered into a contract with General Atomics (GA) to be the Inertial Confinement Fusion (ICF) Target Component Fabrication and Technology Development Support contractor. This report documents the technical activities of the period January 1, 1991 through September 30, 1992. During this period, GA was assigned 15 tasks in support of the Inertial Confinement Fusion program and its laboratories. These tasks included Facilities Activation, Staff Development, and Capabilities Validation to establish facilities and equipment, and demonstrate capability to perform ICF target fabrication research, development, and production activities. The capabilities developed and demonstrated are those needed for fabrication and precise characterization of polymer shells and polymer coatings. We made progress toward production capability for glass shells, barrier layer coatings, and gas idling of shells. We fabricated over 1000 beam diagnostic foil targets for Sandia National Laboratory Albuquerque and provided full-time on-site engineering support for target fabrication and characterization. We initiated development of methods to fabricate polymer shells by a controlled mass microencapsulation technique, and performed chemical syntheses of several chlorine- and silicon-doped polymer materials for the University of Rochester's Laboratory for Laser Energetics (UR/LLE). We performed the conceptual design of a cryogenic target handling system for UR/LLE that will fill, transport, layer, and characterize targets filled with cryogenic deuterium or deuterium-tritium fuel, and insert these cryogenic targets into the OMEGA-Upgrade target chamber for laser implosion experiments. This report summarizes and documents the technical progress made on these tasks. DOE

N93-28910# Texas Univ., Austin. Inst. for Fusion Studies.
SELF-ORGANIZED PROFILE RELAXATION BY ION TEMPERATURE GRADIENT INSTABILITY IN TOROIDAL PLASMAS
Y. Kishimoto, T. Tajima, M. J. LeBrun, M. G. Gray, J. Y. Kim, and W. Horton Feb. 1993 13 p
(Contract DE-FG05-80ET-53088)
(DE93-009580; DOE/ET-53088/589; IFSR-589) Avail: CASI HC A03/MF A01

Toroidal effects on the ion-temperature gradient mode are found to dictate the temperature evolution and the subsequent relaxed profile realization according to our toroidal particle simulation. Both in the strongly unstable fluid regime as well as in the near-marginal kinetic regime we observe that the plasma maintains an exponential temperature profile and forces the heat flux to be radially independent. The self-organized critical relaxed state is sustained slightly above the marginal stability, where the weak wave growth balances the wave decorrelation. DOE

NONCONSERVATIVE AND REVERSE SPECTRAL TRANSFER IN HASEGAWA-MIMA TURBULENCE
P. W. Terry and D. E. Newman Jan. 1993 22 p
(Contract DE-FG02-89ER-53291)
(DE93-010132; DOE/ER-53291/215) Avail: CASI HC A03/MF A01

The dual cascade is generally represented as a conservative cascade of enstrophy to short wavelengths through an enstrophy similarity range and an inverse cascade of energy to long wavelengths through an energy similarity range. This picture, based on a proof due to Kraichnan (Phys. Fluids 10, 1417 (1967)), is found to be significantly modified for a spectra of finite extent. Dimensional arguments and direct measurement of spectral flow in Hasegawa-Mima turbulence indicate that for both the energy and enstrophy cascades, transfer of the conserved quantity is accompanied by a nonconservative transfer of the other quantity. The decrease of a given invariant (energy or enstrophy) in the nonconservative transfer in one similarity range is balanced by the increase of that quantity in the other similarity range, thus maintaining net invariance. The increase or decrease of a given invariant quantity in one similarity range depends on the injection scale and is consistent with that quantity being carried in a self-similar transfer of the other invariant quantity. This leads, in an inertial range of finite size, to some energy being carried to small scales and some enstrophy being carried to large scales. DOE

MOMENT APPROACH TO FAST ION NEOCLASSICAL TRANSPORT AND VISCOUS FORCES
Jian-Ping Wang, Masafumi Azumi, Keiji Tani (Japan Atomic Energy Research Inst., Ibaraki.), and J. D. Callen Jul. 1992 34 p
(DE93-753305; JAERI-M-92-107) Avail: CASI HC A03/MF A01

Fast ion drift kinetic equation is analytically solved in banana regime using a pitch-angle scattering eigenfunction expansion method. The analytical solution of this eigenfunction is made feasible by adopting Cordey's model where the flux-surface averaged pitch-angle (nu(sub parallel)/nu) is replaced by xi, the pitch-angle at the minimum magnetic field. Then, the flux-surface averaged parallel viscous and heat viscous forces, (B dot product del dot product Pi(sub parallel)) and (B dot product del dot product Theta(sub parallel)), are calculated from the drift-kinetic solution to provide the key closure moments which give rise to radial neoclassical transport and bootstrap current. In combination with the recently derived fast ion friction forces, a moment approach is schemed for fusion plasmas with significant fraction of fast ion component. A new orthogonal polynomial expansion method is presented for the fluid flow distortion from an isotropic distribution and applied to expressing the friction forces between fast ions and thermal ions. DOE

A STUDY ON RADIATION SHIELDING ANALYSIS FOR TOROIDAL FIELD COILS OF A TOKAMAK-TYPE FUSION REACTOR
Sergei Zimin (Japan Atomic Energy Research Inst., Ibaraki.) Aug. 1992 226 p
(DE93-753398; JAERI-M-92-120) Avail: CASI HC A11/MF A03

A study on the radiation shield for toroidal field (TF) coils of a tokamak type fusion device is reported. The study was performed to provide the design data base for the radiation shielding analysis for TF coils which can be commonly used for other systems, and to produce some universal recommendation about the neutron flux attenuation in the shield of a fusion reactor. Some simple estimation procedure instead of difficult and expensive neutron calculation can be carried out in this case on the basis of the fundamental knowledge on neutron behavior. The present studies are composed of the fundamentals required for shield estimation, the analysis of shield effectiveness, the analysis of the shielding performance of blankets, the analysis of radiation permeating through the inhomogeneous blanket and shield of a fusion reactor, and the analysis of the TF coil shield of the International Thermonuclear Experimental Reactor (ITER) on the basis of the results of the ITER conceptual design activities for three years. The methodological recommendation was developed for the ANISN and the DOT3 codes. DOE

ELECTRON CYCLOTRON HEATING AND CURRENT DRIVE IN TOROIDAL GEOMETRY
A. H. Kritz Mar. 1993 16 p
(Contract DE-FG02-92ER-54141)
(DE93-010400; DOE/ER-54141/1) Avail: CASI HC A03/MF A01

The Principal Investigator has continued to work on problems associated both with the deposition and with the emission of electron cyclotron heating power electron cyclotron heating in toroidal plasmas. In particular, the work has focused on the use of electron cyclotron heating to stabilize $q = 1$ and $q = 2$ instabilities in tokamaks and on the use of electron cyclotron emission as a plasma diagnostic. The research described in this report has been carried out in collaboration with scientists at Princeton, MIT and Livermore. The Principal Investigator is now employed at Lehigh University, and a small group effort on electron cyclotron heating in plasmas has begun to evolve at Lehigh involving undergraduate and graduate students. Work has also been done in support of the electron cyclotron heating and current drive program at the Center for Research in Plasma Physics in Lausanne, Switzerland. DOE

THE HYDRAULIC ANALYSIS OF CYLINDRICAL FLIBE JETS IN A HYLIFE-2 ICF REACTOR
X. M. Chen (California Univ., Berkeley.), V. E. Schrock (California Univ., Berkeley.), and P. F. Peterson (California Univ., Berkeley.) 10 Mar. 1992 14 p Presented at the 10th Topical Meeting on Technology of Fusion Energy, Boston, MA, 7-12 Jun. 1992
(Contract W-7405-eng-48)
(DE93-009234; UCRL-CR-109547; CONF-920607-20) Avail: CASI HC A03/MF A01

In HYLIFE, a conceptual design of inertial confinement fusion reactors, a liquid jet array is proposed to protect the reactor chamber from fusion radiation. During the pulse of fusion, the jets will sustain severe neutron and x-ray heating. Since the high energy neutrons can penetrate the material fairly well, they induce a nearly uniform and very large pressure rise within each jet. This energy is deposited within nanoseconds or much faster than the time scale for fluid dynamic relaxation. The analysis of the relaxation of the liquid jets in a HYLIFE reactor is important for understanding the configuration of the liquid blanket, which is directly related with the vapor and liquid impacts on the chamber wall. The correct estimation of these impacts will allow designers to optimize the cost and strength of the reactor. The calculations for the cylindrical lithium jets in the HYLIFE-I reactor were done previously by using a compressible flow mode and a soft sphere equation of state developed by Young. A similar equation of state model for Flibe, the HYLIFE-2 blanket material, was recently developed. This equation of state allows us to use the same compressible analysis code to calculate the pressure field in the Flibe jets and to estimate the upper bound of Flibe tension limit. With these results we can predict the possibility of the liquid breakup and the momentum distribution generated by relaxation and breakup. DOE

A SURVEY OF PROBLEMS IN DIVERTOR AND EDGE PLASMA THEORY
A. Boozer (College of William and Mary, Williamsburg, VA.), B. Braams, H. Weitzner, and R. Cohen (Lawrence Livermore National Lab., CA.) 22 Dec. 1992 47 p
(Contract DE-FG02-86ER-53223)
(DE93-007531; DOE/ER-53223/196; MF-125) Avail: CASI HC A03/MF A01

Theoretical physics problems related to divertor design are presented, organized by the region in which they occur. Some of the open questions in edge physics are presented from a theoretician's point of view. After a cursory sketch of the fluid models of the edge plasma and their numerical realization, the following topics are taken up: time-dependent problems, non-axisymmetric effects, anomalous transport in the scrape-off layer, edge kinetic theory, sheath effects and boundary conditions in divertors, electric field effects, atomic and molecular data issues, impurity transport in the divertor region, poloidally localized power dissipation (MARFE's and dense gas targets), helium ash removal, and neutral transport. A summary of selected problems of particular significance and a brief bibliography of survey articles and related conference proceedings are included. DOE

NUMERICAL MODELLING OF THE COLD PLASMA WITH TIME-DEPENDENT, MAGNETOHYDRODYNAMIC METHODS [MODELLIERUNG DES KALTEN PLASMAS MIT HILFE ZEITABHAENGIGER MAGNETOHYDRODYNAMISCHER METHODEN]
R. Schneider and C.-D. Munz May 1992 70 p In GERMAN
(KfK-5053; ETN-93-93463) Copyright Avail: CASI HC A04/MF A01

A simple, one dimensional two phase model of the cold plasma is investigated with the aid of numerical methods playing an important role in compressible hydrodynamics, such as the particle in cell method and the boundary fitted coordinates concept. These methods were developed for the numerical solution of nonlinear hyperbolic conservation laws and are well known in this field as high resolution upwind schemes. On the basis of these methods a new code is developed which solves numerically the time dependent, one dimensional system of model Vlasov and Maxwell equations of the cold plasma. Numerical results obtained with the code for ion transport, electron branching and stationary case show the quality and the properties of the applied methods. ESA

START BROADENED PROFILES WITH SELF-CONSISTENT RADIATION TRANSFER AND ATOMIC KINETICS IN PLASMAS PRODUCED BY HIGH INTENSITY LASERS
G. L. Olson, J. C. Comly, J. K. LaGattuta, and D. P. Kilcrease 1993 14 p Presented at the Radiative Properties of Hot Dense Matter Conference, Santa Barbara, CA, 2-6 Nov. 1992
(Contract W-7405-eng-36)
(DE93-008706; LA-UR-93-478; CONF-9211211-1) Avail: CASI HC A03/MF A01

Spectral line shapes and line strengths have long been used to diagnose plasma temperatures and densities. In dense plasmas, the additional broadening due to Stark effects give additional information about the plasma density. We present calculations that are self-consistent in that the radiation fields of the line transitions and the atomic kinetics are itegrated to convergence. Examples are given for simple plasmas with temperature gradients, density gradients, and velocity fields. Then, a more complex example of a laser produced plasma is presented. DOE

THEORY OF TOKAMAK EDGE TURBULENCE: DRIFT-THERMAL INSTABILITY-INDUCED TURBULENCE AND IONIZATION-DRIVEN DRIFT WAVE TURBULENCE Ph.D. Thesis
Andrew Simon Ware 1992 133 p
Avail: Univ. Microfilms Order No. DA9307205

Two models of tokamak edge turbulence are examined: drift-thermal instability-induced turbulence and ionization driven drift wave turbulence. A simple model for drift-thermal instability-induced turbulence is derived and studied both analytically and numerically. Both nonlocal, nonlinear analytical calculations and three-dimensional computations are used. Potential and temperature fluctuation levels and radial correlation lengths are calculated and compared to numerical results. The saturation mechanism and the role of a fluctuation-generated shear flow are elucidated. The numerical calculations are used to obtain spectra and correlation lengths. A detailed comparison of analytical and numerical results is given. The theory of ionization-driven drift wave turbulence is presented in the context of a quasi-local model. Linear analysis reveals that ionization effects can destabilize collisional drift waves and can possibly induce parallel shear flow instabilities, as well. Nonlinear analysis indicates that energy is transferred from large to small stable scales and converted to ion kinetic energy. Results indicate mode coupling effects are dominant. Large fluctuation levels, in excess of mixing length expectations, are predicted. The ionization source drives a purely inward particle flux, which can explain the anomalously rapid up-take of particles which occurs in response to gas puffing. Finally, the development of a local model of ionization driven drift wave turbulence is extended to include the effects of magnetic shear and poloidal source asymmetry, as well as poloidal mode coupling arising from both magnetic drifts and the source asymmetry. Numerical and analytic investigation confirms that ionization effects can destabilize collisional toroidal drift waves. However, the mode structure is determined primarily by the ion curvature and del(B) drifts and is not overly affected by the poloidal source asymmetry. In addition, the role poloidal asymmetries in both the source and turbulent particle diffusion play in the generation of sheared mean parallel flow is considered. Predictions of sonic parallel shear flow (v(sub parallel)(r) is approximately c(sub s)) induced by poloidally asymmetric diffusion are an unphysical result of the assumption of purely parallel flow (i.e. v(sub perpendicular) = 0) and the neglect of turbulent parallel momentum transport. Results indicate that the flow produced is subcritical to the parallel shear flow instability when diamagnetic effects are poorly considered. Dissert. Abstr.

COLLECTIVE TRANSPORT OF ALPHA PARTICLES DUE TO ALFVEN WAVE INSTABILITY
B. N. Breizman, H. L. Berk, and H. Ye Feb. 1993 32 p
(Contract DE-FG05-80ET-53088)
(DE93-009578; DOE/ET-53088/591; IFSR-591) Avail: CASI HC A03/MF A01

Recently a new point of view has developed for describing saturation of discrete modes excited by weak sources. The method applies to the evolution of energetic particles in the beam plasma instability as well as to the description of how (alpha) particles evolve when they destabilize Alfven waves under reactor conditions. Over a wide range of parameters the system produces pulsations, where there are relatively brief bursts of wave energy separated by longer intervals of quiescence. There are two types of pulsations; benign and explosive. In the benign phase, valid when particle motion is not stochastic, the distribution function is close to that predicted by classical transport theory, and the instability saturates when the wave trapping frequency equals the expected linear growth rate. If the field amplitude in a burst reaches the level where orbit stochasticity occurs, the quasilinear diffusion causes rapid transfer of particle energy to wave energy and rapid flattening of the particle distribution function. The bursting phase is followed by a relatively long quiescent time interval where the source provides the necessary free energy to regenerate the cycle. The critical issue is whether the instability develops to a high enough level to produce stochastic diffusion. In general this question can be assessed by using mapping methods to obtain criteria of overlapping of orbit resonance. DOE

COMPUTING FOR MAGNETIC FUSION ENERGY RESEARCH: AN UPDATED VISION
P. Henline, ed. 24 Feb. 1993 23 p
(DE93-010394; DOE/ER-0583T) Avail: CASI HC A03/MF A01

This Fusion Computing Council perspective is written to present the primary of the fusion computing community at the time of publication of the report necessarily as a summary of the information contained in the individual sections. These concerns reflect FCC discussions during final review of contributions from the various working groups and portray our latest information. This report itself should be considered as dynamic, requiring periodic updating in an attempt to track rapid evolution of the computer industry relevant to requirements for magnetic fusion research. The most significant common concern among the Fusion Computing Council working groups is networking capability. All groups see an increasing need for network services due to the use of workstations, distributed computing environments, increased use of graphic services, X-window usage, remote experimental collaborations, remote data access for specific projects and other collaborations. Other areas of concern include support for workstations, enhanced infrastructure to support collaborations, the User Service Centers, NERSC and future massively parallel computers, and FCC sponsored workshops. STRUCTURAL DESIGN OF CRYOSTAT AND PORT PENETRATION OF INTERNATIONAL THERMONUCLEAR EXPERIMENTAL REACTOR (ITER)
Masafumi Sawa, Naokazu Kanamori, Katsuhiro Shimizu, Yukio Nomura, Yoshinao Ohkawa, Kiyoshi Shibanuma, and Eisuke Tada Jul. 1992 110 p
(DE93-753267; JAERI-M-92-094) Avail: CASI HC A06/MF A02

Preliminary structural design of the ITER cryostat and port penetration based on concrete cryostat was conducted and the structural concept compatible with remote handling and nuclear shielding is proposed. The ITER cryostat was mainly composed of side wall, upper cover, upper port, horizontal port, vacuum port, and cooling pipe penetration. The upper cover is designed to be fully detachable structure by remote handling for assembling/disassembling the poloidal field coils. In addition, the upper cover provides the biological shield for personal access for the blanket maintenance operation. The upper port is designed to meet the requirements of cooling pipe penetration, blanket maintenance and biological shield. The layout of the cooling pipe is defined by simple thermal stress analysis. There are 16 horizontal ports arranged around the cryostat to provide the access of heating and current drive system, fuel injection, blanket test modules, vacuum pumps and remote handling manipulators. Each port should have the biological shield and bellows to prevent an excessive thermal stress due to thermal expansion. These bellows are non-circular cross-section and the reinforced structure to prevent buckling is proposed. A partial model of the seal mechanism applicable to large gate valves connected to the horizontal ports was fabricated and the basic performance under cyclic loading was investigated. As a whole, the design concept of the cryostat and port penetration was successfully developed and more detailed analysis and critical technology development will be conducted in the Engineering Design Phase. TRANSIENT TESTS ON AN MHD THRUSTER
E. S. Pierson (Purdue Univ., Hammond, IN.), J. Libera, and M. Petrick 1993 29 p Presented at the 7th Beer-Sheva International Seminar on Magnetohydrodynamics, Jerusalem, Israel, 14-18 Feb. 1993
(Contract W-31-109-eng-38)
(DE93-008656; ANL/ES/CP-78904; CONF-930216-1) Avail: CASI HC A03/MF A01

Three different types of transient tests were made: coast downs to zero voltage and current under open circuit and short circuit conditions, reverses where the applied voltage was reversed to the same or a different value, and jumps where the voltage applied to the thruster was increased without a change in polarity. Most except the coast downs were done both quickly (voltage changes as fast as possible) and slowly (6 s to complete the voltage change). A few slower (12 s) transients were done. Transient runs were made for water conductivities of 16.2 and 5.09 S/m. In all cases steady-state conditions were established and several seconds of data taken before initiating the transients. Data were measured every 0.75 to 1 .5 second over the time interval of interest. Particular attention was paid to looking for evidence of gas bubbles, and to the chance of the voltage profiles between the electrodes. The data are interpreted based on the behavior of the power supply and the thruster. DOE

POLOIDAL FIELD MEASUREMENTS DURING TRANSIENT PHENOMENA ON MTX: SAWTOOTH PERTURBATIONS AND THE EFFECT OF ECH ON DISRUPTIONS
B. W. Rice and E. B. Hooper Jan. 1993 28 p Presented at the US-Japan Workshop on Transient Phenomena in Toroidal Plasmas, San Diego, CA, 20-22 Jan. 1993
(Contract W-7405-eng-48)
(DE93-010516; UCRL-JC-112718; CONF-930198-1) Avail: CASI HC A03/MF A01

A fifteen channel far-infrared polarimeter has been used to measure poloidal field (B(sub p)) profiles during transient events on MTX. Here we present experimental results on two separate phenomena. First, strong

B(sub p) perturbations are observed to be correlated with the sawtooth crash. The on-axis safety factor q(sub 0) approximately 0.8, is approximately constant before and after the crash. Although the perturbed field profile during the crash is too complex to invert unambiguously, several observations concerning existing sawtooth models can be made. The low value of q(sub 0) combined with the large amplitude and complex radial structure of the B(sub p) perturbations, is more consistent with the stochastic or the double-layer reconnection sawtooth models rather than other standard models such as Kadomtsev reconnection or quasi-interchange. In addition, poloidal field measurements were made prior to disruptions on MTX, both with and without electron cyclotron heating (ECH). The disruption studied here, is related to the buildup of heavy-metal impurities in the core, which is particularly prevalent at lower densities. The impurity radiation leads to a collapse of the T(sub e), and J profiles followed by a disruption. The application of on-axis ECH during the T(sub e) collapse but prior to the disruption can repeak the T(sub e) and J profiles thus preventing the disruption. Since the core impurity radiation depends quite sensitively on T(sub e) heating significantly effects the power balance in the core, leading to stability for this type of disruption. DOE

EFFECTS OF NEUTRAL GAS COLLISIONS ON THE POWER TRANSMISSION FACTOR AT THE DIVERTOR SHEATH
A. H. Futch, D. N. Hill, R. A. Jong, G. D. Porter, G. F. Matthews (Joint European Torus Project, Abingdon, England.), and D. Buchenauer (Sandia National Labs., Albuquerque, NM.) 23 Mar. 1992 12 p Presented at the 10th International Conference on Plasma-Surface Interactions in Controlled Fusion Devices, Monterey, CA, 30 Mar. - 3 Apr. 1992
(Contracts W-7405-eng-48; DE-AC03-89ER-51114; DE-AC04-76DP-00789)
(DE93-009320; UCRL-JC-109999; CONF-920311-27) Avail: CASI HC A03/MF A01

We show that charge-exchange and other ion-neutral collisions can reduce the power transmission factor of the plasma sheath, thereby lowering the ion impact energy and target plate sputtering. The power transmission factor relates the heat flux reaching the divertor target to the surface: Delta= Q(sub surf)/n(sub e)T(sub e)C(sub s). Experimental data from the D3-D tokamak suggest that Delta could be as low as 2-3 near the region of peak divertor particle flux, instead of the 7-8 expected from usual sheath theory. Several effects combine to allow ion-neutral interactions to be important in the divertor plasma sheath. The shallow angle of incidence of the magnetic field (1-3 degrees in D3-D) leads to the spatial extension of the sheath from approximately (pi)i approximately = 1 mm normal to the plate to several centimeters along the field lines. Ionization reduces the sheath potential, and collisions reduce the ion impact energy. DOE

A NOVEL APPROACH FOR NEW RADIATION SOURCES BASED ON SOLID STATE PLASMA INSTABILITIES Final Report, Dec. 1989 - 1992
P. Bakshi and K. Kempa Feb. 1993 11 p
(Contract DAAL03-90-G-0015)
(AD-A263699; ARO-26682.12-PH) Avail: CASI HC A03/MF A01

A Novel Approach for New Radiation Sources based on current driven plasma instabilities (CDPI) in layered solid state systems was developed. The feasibility of generating CDPI in a variety of systems, and of conversion of the energy of the growing plasma waves to electromagnetic radiation is demonstrated. The most promising candidates for experimental verification and device applications within the class of uniform lower dimensional systems were identified. In addition, there are preliminary indications that modulated lower dimensional systems would significantly enhance these effects. Experimental efforts were stimulated to confirm the results of the investigations. DTIC

ELEMENTAL COMPOSITIONS OF HIGH-ENERGY IONS PRODUCED BY MAGNETOSONIC WAVES IN QUIESCENT PLASMAS
M. Toida, T. X. Zhang, and Y. Ohsawa May 1992 18 p
(DE93-753241; PSC-17) Avail: CASI HC A03/MF A01

The structure of a nonlinear magnetosonic wave in a multiple-ion-species plasma is analytically investigated, and the elemental composition of ions reflected by the magnetosonic wave is studied. Firstly, stationary solutions of magnetosonic waves propagating perpendicularly to a magnetic field in a plasma consisting of electrons and two-species ions are obtained from a fluid model. Secondly, on the basis of the solitary wave solution, conditions for ion reflection are discussed. Then, the fraction of high-energy ions produced by a magnetosonic wave is expressed in terms of the ion mass, charge, thermal speed, Alfven speed, and wave amplitude. It rapidly decreases with increasing mass. It is found that most of the light ions can be reflected in a multiple-ion-species plasma even for small-amplitude waves if the masses of the main component ions are sufficiently heavy. DOE

MODELING THE D3-D PLASMA BOUNDARY WITH THE LEDGE CODE
G. D. Porter, M. E. Rensink, T. D. Rognlien, R. A. Jong, and D. N. Hill Aug. 1992 6 p Presented at the 14th International Conference on Plasma and 19th European Physical Society (EPS) Conference on Controlled Fusion and Plasma Physics, Innsbruck, Austria, 29 Jun. - 3 Jul. 1992
(Contract W-7405-eng-48)
(DE93-009301; UCRL-JC-109538; CONF-920610-15) Avail: CASI HC A02/MF A01

The results of a determination of the radial transport coefficients in the boundary plasma of the DIII-D tokamak is reported. The boundary plasma is defined to be the plasma in the region immediately outside the last closed flux surface of a diverted plasma configuration. Values of the electron thermal diffusivity, chi(sub e), the particle diffusivity, D(sub perpendicular), and the radial convective velocity, v(sub perpendicular) are obtained by comparison between experimental data and a 2-D fluid model. The data are obtained from neutral beam heated ELMing H-mode discharges with 5.0 less than or equal to P(sub beam) less than or equal to 11.0 MW, and 1.0 less than or equal to I(sub P) less than or equal to 1.75 MA. The diffusion coefficients lie in the range 0.03 less than or equal to D(sub perpendicular) less than or equal to 0.25 sq m/s, and 0.2 less than or equal to chi(sub e) less than or equal to 0.5 sq m/s. The convective velocity is found to be zero for all data discussed. The 2-D fluid code and the data used for determination of the transport coefficients are described. The results of our analysis are described, and conclusions are presented. DOE

FUSION LASER OSCILLATOR AND PULSE-FORMING SYSTEM USING INTEGRATED OPTICS
R. B. Wilcox, W. Behrendt, D. F. Browning, D. R. Speck, and B. M. VanWonterghem Jan. 1993 13 p Presented at the International Symposium on Advanced Electronic and Optoelectronic Materials, Los Angeles, CA, 20-23 Jan. 1993
(Contract W-7405-eng-48)
(DE93-009286; UCRL-JC-111393; CONF-930135-1) Avail: CASI HC A03/MF A01

In order to demonstrate new technology for the proposed National Ignition Facility (NIF), we are currently building a 5-kilojoule laser called Beamlet. The oscillator and pulse shaping system for Beamlet represents a major technological improvement over previous designs. This is true of the laser systems being considered for a NIF in general, but the pulse-forming system is a particularly radical departure from the typical philosophy of master-oscillator design. Using integrated optics, fiber optics, and diode-pumped lasers instead of bulk optics and flashlamp-pumped lasers, this new master oscillator takes advantage of current technology to make a system with numerous advantages. The requirements for a NM for greater flexibility and reliability necessitate this new approach: the pulse-forming system for the Beamlet will demonstrate a subset of the capabilities required for a NIF. For the Beamlet we must produce a single 1-10 ns. shaped- and frequency-modulated pulse. The Beamlet needs only to generate square output pulses for technology demonstration purposes, but the input pulses must be shaped to compensate for gain saturation in the power amplifier. To prevent stimulated Brillouin scattering (SBS) from damaging the output optics, the output pulse must have some bandwidth, and thus the pulse-forming system phase modulates the input pulse. These requirements are very similar to those for the Nova master oscillator system, but Nova technology is not the best choice for the Beamlet. In developing an oscillator design for a fusion laser system, the system requirements are defined by the oscillator's place in the overall laser architecture. Both Nova and the Beamlet use a master oscillator-power amplifier (MOPA) architecture. In a MOPA-laser architecture, a low-power oscillator is followed by a high-gain, high-power amplifier. If the output signal is to have a high signal-to-noise ratio (SNR), the oscillator-signal power must be high above the amplifier noise power. DOE

THE PRODUCTION AND EVOLUTION OF PLASMA AND ASSOCIATED MAGNETIC FIELDS DURING HYPERVELOCITY IMPACTS: IMPLICATIONS FOR PLANETARY PALEOMAGNETISM Ph.D. Thesis
David Allen Crawford 1992 217 p
Avail: Univ. Microfilms Order No. DA9308794

Magnetic fields generated within plasma produced by hypervelocity meteoroid impacts were proposed to explain the remanent magnetism of some lunar samples as well as broad areas of the lunar surface. The origin of the lunar remanent fields may be due to crustal remanence of a core dynamo field occurring early in lunar history prior to extensive modification by impact or remanence of transient fields, particularly associated with impacts, occurring on a local scale throughout lunar history. The presence of an early core dynamo field would have strong consequences for the formation and early evolution of the Moon, yet to deconvolve the role that an internally generated core dynamo field may have had, it is necessary to understand the important role that impact-induced magnetization may have on the magnetic state of the lunar surface. The production and evolution of plasma and associated magnetic fields during hypervelocity impacts through an iterative experimental and theoretical approach is addressed. The configuration and duration of spontaneous impact-generated magnetic field observed in the laboratory are dependent on projectile and target composition and have a strong dependence on impact angle. Self-similar, one-dimensional solutions for the evolution of the magnetic field within impact-generated plasma demonstrate that peak magnetic field strength probably increases with increasing crater size at the same diameter-scaled distance. Magnetic fields produced by highly oblique (less than 15 deg -30 deg from horizontal) impacts are particularly enhanced. Impact-generated magnetic fields, extrapolated from experimental data, are likely to be large enough to account for the magnetization of certain relatively young (less than 3 Ma-1.5 Ga) lunar sample and may help account for the lunar magnetic record during the last approximately 3.6 billion years. More generally, crater-related paleomagnetic fields on solid surface bodies in the solar system may be general compositional indicators (e.g. asteroidal vs. cometary impacts) and may yield a diagnostic signature of impact angle where other clues (shape, eject a pattern) are absent or ambiguous. Dissert. Abstr.

BOOTSTRAP CURRENT PROFILES AND SCALING IN LARGE ASPECT RATIO TOKAMAKS
Noboru Fujisawa (Japan Atomic Energy Research Inst., Naka.) and Tomonori Takizuka (Japan Atomic Energy Research Inst., Naka.) May 1992 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-753158; JAERI-M-92-064) Avail: CASI HC A03

Recently, bootstrap currents, generated spontaneously in a tokamak plasma, have been observed in large tokamak devices. Those bootstrap currents are applied to designs of a next-generation experimental tokamak reactor like ITER and following tokamak power reactors. A simple expression for a bootstrap current of a tokamak with a large aspect ratio is proposed, which can easily evaluate the bootstrap current. Some empirical scalings for a bootstrap current with a finite aspect ratio have been proposed so far, and the applicability of them is briefly discussed. DOE

PLASMA/PARTICLE INTERACTION IN SUBSONIC ARGON/HELIUM THERMAL PLASMA JETS
W. D. Swank, J. R. Fincke, and D. C. Haggard 1993 6 p Presented at the National Thermal Spray Conference, Anaheim, CA, 7-11 Jun. 1993
(Contract DE-AC07-76ID-01570)
(DE93-010808; EGG-M-92454; CONF-9306130-1) Avail: CASI HC A02/MF A01

Understanding the behavior of a particle and the interactions between a particle and the plasma surrounding it is important to the development and optimization of the plasma spray coating process. This is an experimental study of the interaction between a subsonic thermal plasma jet and injected nickel-aluminum particles. The velocity, temperature and composition of the gas flow field is mapped using an enthalpy probe/mass spectrometer system. The particle flow field is examined by simultaneously measuring the in-flight size, velocity, and temperature of individual particles. The complex interaction between the gas and particle flow fields is examined by combining the two sets of data. Particle and gas temperatures and velocities are compared in the vicinity of a nominal substrate standoff distance and axially along the median particle trajectory. The temperature and velocity difference is shown to vary substantially depending on the particle's trajectory. By the time a particle on the median trajectory reaches the nominal substrate stand off of 63.5 mm it is transferring it's heat and momentum to the plasma gas. DOE

Work on ICRF interaction with the edge plasma is reported. ICRF generated convective cells have been established as an important mechanism for influencing edge transport and interaction with the H-mode, and for controlling profiles in the tokamak scrape-off-layer. Power dissipation by RF sheaths has been shown to be significant for some misaligned ICRF and IIBW antenna systems. Near-field antenna sheath work has been extended to the far-field case, important for experiments with low single pass absorption. Impurity modeling and Faraday screen design support has been provided for the ICRF community. In the area of core-ICRF physics, the kinetic theory of heating by applied ICRF waves has been extended to retain important geometrical effects relevant to modeling minority heated tokamak plasmas, thereby improving on the physics base that is standard in presently employed codes. Both the quasilinear theory of ion heating, and the plasma response function important in wave codes have been addressed. In separate studies, it has been shown that highly anisotropic minority heated plasmas can give rise to unstable field fluctuations in some situations. A completely separate series of studies have contributed to the understanding of tokamak confinement physics. Additionally, a diffraction formalism has been produced which will be used to access the focusability of lower hybrid, ECH, and gyrotron scattering antennas in dynamic plasma configurations. DOE

MEASUREMENT OF WORK FUNCTION OF A PLASMA GRID IN A CESIUM SEEDED NEGATIVE ION SOURCE
Yasuo Suzuki, Masaya Hanada, Yoshikazu Okumura, and Masanobu Tanaka Nov. 1992 22 p
(DE93-764153; JAERI-M-92-168) Avail: CASI HC A03/MF A01

Work function of a plasma grid in a cesium seeded negative ion source was measured by Las photo-emission technique. We have investigated the relation between the work function and the H(sup -) ion current as well as the temperature of the plasma grid. Changing the position of the Laser incidence, we found that a uniform cesium layer was formed over the plasma grid by continuous arc discharge. The work function was decreased with temperature rise of the plasma grid. The minimum work function was estimated to be 1.75 eV at 260 C. Dependence of the H(sup -) ion current on the work function was investigated in the JAERI Multi-Ampere H(sup -) ion source. As a result, it was confirmed that the H(sup -) ion current increased rapidly as the work function decreased. When the H(sup -) ion current was the maximum, the work function was found to be about 1.8 eV. These dependence agree with H(sup -) ion current rise induced by cesium seeding. DOE

PRELIMINARY DESIGN STUDY OF A STEADY STATE TOKAMAK DEVICE
Naoyuki Miya, Shinji Nakajima, and Kenkichi Ushigusa Sep. 1992 162 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-764162; JAERI-M-92-140) Avail: CASI HC A08

Preliminary design study has been made for a steady tokamak with the plasma current of 10MA, as the next to the JT-60U experimental programs. The goal of the research program is the integrated study of steady state, high-power physics and technology. Present candidate design is to use superconducting TF and PF magnet systems and long pulse operation of 100's-1000's of sec with non inductive current drive mainly by 500keV negative ion beam injection of 60MW. Low activation material such as titanium alloy is chosen for the water tank type vacuum vessel, which is also the nuclear shield for the superconducting coils. The present preliminary design study shows that the device can meet the existing JT-60U facility capability. DOE

OPERATION OF A 20-CHANNEL GRATING POLYCHROMATOR DIAGNOSTIC SYSTEM AND ITS APPLICATION TO SAWTOOTH OBSERVATIONS IN JT-60U
Shinichi Ishida, Nobuaki Isei, and Masayasu Sato Aug. 1992 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-764388; JAERI-M-92-111) Avail: CASI HC A03

In the JT-60U tokamak, the ECE measurements have been made by means of a twenty-channel grating polychromator diagnostic system (GPS) in which a newly developed detector system by the use of low-noise preamplifiers was installed. Operational performance of the GPS with respect to resolutions and noise level is described. The ECE measurements coupled with equilibrium analysis to calculate a local magnetic field strength show good internal-consistency between the equilibrium configuration and the sawtooth inversion locations. Based on the result, the dependence of the normalized inversion radius on the inverse safety factor and the observation of m = 1 mode oscillations are presented. A preliminary result from ECE reconstruction applied to a precursor oscillation represents the formation of a clear crescent m = 1 island, a hot spot and a narrow cold region. DOE

ION RING DISTRIBUTION PRODUCED BY A MAGNETOSONIC WAVE
M. Toida, T. X. Zhang, and Y. Ohsawa Jul. 1992 13 p
(DE93-754311; PSC-23) Avail: CASI HC A03/MF A01

Ion orbits reflected by a magnetosonic wave are theoretically analyzed, and the conditions for ion reflection are derived. In a low beta case, those reflected ions can form a ring distribution in the velocity space. The velocity and energy distribution functions of those particles are obtained. DOE

USU CENTER OF EXCELLENCE IN THEORY AND ANALYSIS OF THE GEO-PLASMA ENVIRONMENT Final Report, 1 Oct. 1989 - 30 Sep. 1992
Robert W. Schunk 17 Feb. 1993 33 p
(Grant AF-AFOSR-0026-90)
(AD-A264750; AFOSR-93-0204TR) Avail: CASI HC A03/MF A01

A team of ten Ph.D. scientists and several graduate students was assembled at USU to work in close collaboration with scientists at the Air Force Geophysics Laboratory on a number of problems that are relevant to Air Force systems, including OTH radars, communications, and orbiting space structures. The overall goal of the research was to obtain a better understanding of the basic chemical and physical processes operating in the geoplasma environment, including the ionosphere, thermosphere, and magnetosphere. Some of the specific tasks included the following: (1) studies of ionospheric structure and irregularities; (2) study the feasibility of developing better operational ionospheric models; (3) conduct model/data comparisons in order to validate the ionospheric models; (4) study plasma electrodynamics in the high latitude ionosphere; (5) study magnetosphere-ionosphere coupling problems; (6) continue the development of a thermospheric circulation model; (7) study plasmasphere refilling problems; (8) study OTH ray tracing problems at high latitudes; and (9) study certain spacecraft-environment interaction problems, including those related to high-voltage power sources, spacecraft outgassing, artificial plasma cloud expansion, and spacecraft charging at LEO altitudes. HIGH DENSITY PLASMA PRODUCTION IN A MULTICUSP PLASMA GENERATOR WITH RF ANTENNA
Yasuo Suzuki, Masaya Hanada, Yoshikazu Okumura, and Masanobu Tanaka Oct. 1992 22 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-764493; JAERI-M-92-156) Avail: CASI HC A03

A high density plasma was produced by radio-frequency in a multicusp plasma generator. The generator is a cylindrical chamber of 200 mm in inner diameter and 270 mm in length with 1-3 turn copper tube antenna. By injecting a 2 MHz, 20 kW RF into the multicusp plasma generator, hydrogen plasma of an ion saturation current density of 120 mA/sq cm and a hydrogen plasma of a density of 6.0(10)(exp 11)/cu cm was produced at a pressure of 0.6 Pa in the generator. The ion saturation current density was uniform over the central area of 100 mm in diameter. Coating the antenna with an insulator, we proved that the efficiency of the plasma production was improved. OPTIMIZATION FOR STEADY-STATE AND HYBRID OPERATIONS OF ITER BY USING SCALING MODELS OF DIVERTOR HEAT LOAD
Yoshiki Murakami, Kiyoshi Itami, Masayoshi Sugihara, and Hirobumi Fujieda Sep. 1992 54 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-764151; JAERI-M-92-145) Avail: CASI HC A04

Steady-state and hybrid mode operations of ITER are investigated by 0-D power balance calculations assuming no radiation and charge-exchange cooling in divertor region. Operation points are optimized with respect to divertor heat load which must be reduced to the level of ignition mode (approximately 5 MW/sq m). Dependence of the divertor heat load on the variety of the models, i.e., constant-(chi) model, Bohm-type-(chi) model, and JT-60U empirical scaling model, is also discussed. The divertor heat load increases linearly with the fusion power (P(sub FUS)) in all models. The possible highest fusion power greatly differs for each model with an allowable divertor heat load. The heat load evaluated by the constant-(chi) model is, for example, about 1.8 times larger than that by Bohm-type-(chi) model at P(sub FUS) = 750 MW. Effect of reduction of the helium accumulation, improvements of the confinement capability and the current-drive efficiency are also investigated aiming at lowering the divertor heat load. It is found that NBI power should be larger than about 60 MW to obtain a burn time longer than 2000 s. The optimized operation point, where the minimum divertor heat load is achieved, does not depend on the model and is the point with the minimum-P(sub FUS) and the maximum-P(sub NBI). When P(sub FUS) = 690 MW and P(sub NBI) = 110 MW, the divertor heat load can be reduced to the level of ignition mode without impurity seeding if H = 2.2 is achieved. Controllability of the current-profile is also discussed. DOE

(DE93-606271; IYaF-91-66) Avail: CASI HC A03/MF A01 (US Sales Only)

Energy spectra of a 1 MeV, 70 kA, 4(mu)s, 140 kJ relativistic electron beam (REB) on the U1-SPIN device are measured before and after passing through gas/plasma prefilled drift chamber using multifoil analyzer. The drift chamber is a 1-meter, 10 cm diameter stainless steel tube with 4T longitudinal magnetic field. The initial beam injected to the tube from the accelerator diode is monoenergetic. For high gas densities (approximately 10(exp 16)cm(sup -3)) the energy spectrum on the exit of the tube remains the same as it is the diode. If the gas/plasma density is less then 10(exp 15)cm(sup -3) the energy loss up to 20% is observed. At the initial gas density about 10(exp 13)cm(sup -3) appreciable fraction (approximately 10%) of the beam electrons with the energy more than initial one appears. Specific features of the diagnostic technique are discussed in detail. DOE

EXPERIMENTAL MHD STABILITY LIMIT IN THE GAS-DYNAMIC TRAP
P. A. Bagryanskij, A. A. Ivanov, and A. N. Karpushov et al 1991 14 p
(DE93-606218; IYaF-91-68) Avail: CASI HC A03/MF A01 (US Sales Only)

The results of extensive experimental investigations of a plasma magnetohydrodynamic (MHD) stability in gas-dynamic trap GDT, which were carried out over the past 3 years at Novosibirsk are summarized. The objective of the experiments reported was to give experimental evidence of plasma stability in GDT and compare the conditions under which it would be achieved, with the theoretical predictions. It was found that theoretical predictions generally agree with the measurements with only one notable exception, namely the limit in the mirror ratio for the plasma stability. This observation is discussed in detail. DOE

PLASMA DIFFUSION THROUGH MULTIDIPOLE MAGNETIC FIELDS
J. L. Ferreira Mar. 1992 26 p
(DE93-608548; INPE-5384; PRE-1750) Avail: CASI HC A03/MF A01 (US Sales Only)

The diffusion of a cold plasma through multidipole fields of a magnetic picket fence is presented. The ion diffusion and trapping is determined by electric potentials inside the multidipole fields. The electron diffusion is regulated by an anomalous transport process driven by low frequency fluctuations inside the magnetic sheath. Particles drifting with velocities above the ion acoustic speed generates high amplitude turbulent waves responsible for an anomalous diffusion process. DOE

ANALYSIS OF ELECTROTHERMAL INTERACTIONS IN POWER SEMICONDUCTOR MODULES Ph.D. Thesis [EIN BEITRAG SUR ANALYSE DER ELEKTROTHERMISCHEN WECHSELWIRKUNGEN IN LEISTUNGSHALBLEITERMODULEN]
Peter Zwanziger 1992 258 p In GERMAN
(ETN-93-93800) Avail: CASI HC A12/MF A03

The electrothermal coupling through combination of an electrical and a thermal model based on physically phenomenological concepts is described. The models are developed for bipolar power transistors and IGBT (Insulated Gate Bipolar Transistors) and take into account nonhomogeneities and temperature variations. Electrical components and characteristics of choppers realized with semiconductor devices were analyzed: a linear model was developed for describing switching processes, and switching dissipation in diode was calculated by periodic impulses of switcher. Influence of inductive potential drop, intermediate circuit tension, and return current on power balance were characterized. Charge carrier lifetime, conduction voltage of diodes and several transistors were calculated by varying blocking layer temperature and conduction voltages of a transistor with three level Darlington configuration and of an IGBT were calculated. A stationary model of the temperature distribution in substrate with semiconductor modules cooled on one side was developed and the temperature of coupled semiconductors was calculated with dissipation dependent, equivalent thermal resistances. The electrothermal simulation was applied to both bridge arms of a pulse width modulation converter with voltage feed. ESA

LUMINESCENCE STUDY OF ION-IMPLANTED AND MBE-GROWN Er-DOPED GaAs AND Al(x)Ga(1-x)As Ph.D. Thesis
Jose E. Colon Mar. 1993 275 p
(AD-A262602; AFIT/DS/ENP/93-01) Avail: CASI HC A12/MF A03

The excitation and de-excitation mechanisms of the 1.54 microns emissions, from ion implanted and MBE grown GaAs:Er and Al(x)Ga(1-x)As:Er, were studied through luminescence experiments. Experimental techniques included photoluminescence, time resolved photoluminescence, and selective excitation photoluminescence. The Er(3+) emissions were studied as a function of Er concentration, aluminum mole fraction, n- and p-type doping level, and annealing temperature. In addition oxygen co-doping studies were done in order to determine the role played by oxygen in the Er(3+) luminescence. DTIC

OPTICALLY CONTROLLED SOLID STATE OPENING SWITCHES Final Report, 1 Aug. 1988 - 31 May 1992
Chi H. Lee and M. J. Rhee 1992 234 p
(Grant AF-AFOSR-0246-88)
(AD-A262404; AFOSR-93-0197TR) Avail: CASI HC A11/MF A03

This is the final technical report for a research program to study optical controlled solid state opening switches. This program covers the period between August, 1988 and May, 1992 under the grant No. AFOSR-88-0246. The goal of the research is to study fundamental issues in a novel scheme to generate high power electrical pulsed power using optical controlled solid state opening switches. An optically controlled pulsed power system has been developed which is capable of delivering high power pulsed energy. This system employs a photoconductive semiconductor switch (PCSS) in an inductive energy storage pulsed power system (IESPPS). IESPPS offer advantage of small size with voltage and power step-up. However IESPPS imposes several stringent requirements on the switch. In fact, the switch must be nearly ideal with regard to fast opening time and low on-state resistance. Nevertheless, the PCSS performs quite well, yielding power gains of 50 with power output of nearly 100 KW. In this work, the pulse forming theories in the dual of the LC generator, the current charged transmission line (CCTL) and the dual of the Blumlein line DBL are studied for the first time. DTIC

POWDER X RAY DIFFRACTION PATTERNS OF ENERGETIC MATERIALS FOR USE AS REFERENCE STANDARDS
D. B. Sullenger (Miami Univ., Oxford, OH.), J. S. Cantrell (Miami Univ., Oxford, OH.), and T. A. Beiter (Miami Univ., Oxford, OH.) 18 Mar. 1993 128 p
(Contract DE-AC04-88DP-43495)
(DE93-009903; MLM-3774) Avail: CASI HC A07/MF A02

This report lists eighteen quality powder x-ray diffraction patterns produced at Mound for various explosives of recent and current interest. In each case the best possible experimental pattern, obtained from the substance in question via automated diffractometric step-scans, was compared with the corresponding pattern, calculated from the lattice and atomic positional parameters of the crystal structure, if known, and a reconciliation sought between the two was sought. In order to make these patterns more useful to various types of practitioners, previously published patterns for these substances have been included, together with a brief description of their crystallographies, some Chemical Abstracts reference information about them, and an evaluation of their quality via accepted powder diffraction criteria. Most of these patterns have been accepted by the International Center for Diffraction Data for inclusion in their Powder Data File; the others will be submitted in due course. DOE

THEORY OF NORMAL AND SUPERCONDUCTING PROPERTIES OF FULLERENE-BASED SOLIDS
M. L. Cohen Oct. 1992 23 p
(Contract DE-AC03-76SF-00098)
(DE93-007722; LBL-32955) Avail: CASI HC A03/MF A01

Recent experiments on the normal-state and superconducting properties of fullerene-based solids are used to constrain the proposal theories of the electronic nature of these materials. In general, models of superconductivity based on electron pairing induced by phonons are consistent with electronic band theory. The latter experiments also yield estimates of the parameters characterizing these type H superconductors. It is argued that, at this point, a 'standard model' of phonons interacting with itinerant electrons may be a good first approximation for explaining the properties of the metallic fullerenes. DOE

OPTICALLY TILED FLAT PANEL DISPLAYS. A FEASIBILITY STUDY Final Report
Bernard S. Fritz Nov. 1992 18 p
(Contract MDA972-92-M-0007)
(AD-A262737) Avail: CASI HC A03/MF A01

This report presents the results of a study examining the feasibility of micro-optic arrays to eliminate the seams between tiling modules making up a large flat panel display. The individual modules consist of commercially-available liquid crystal displays (LCD). We have found that tiling seams can be removed with micro-optic arrays but only by compromising other important display attributes, most notably display luminance and spectral bandwidth. The assumed module edge gap of 17.5 mm is the dominant parameter limiting performance, and this gap must be less than approx. 1-10 mm in order to have acceptable performance with existing backlights and LCD modules. DTIC

EXCITED STATES IN ELECTRONIC STRUCTURE CALCULATIONS
S. G. Louie Jul. 1992 10 p Presented at the 10th International Conference on Vacuum Ultraviolet Radiation Physics, Paris, France, 27-31 Jul. 1992
(Contract DE-AC03-76SF-00098)
(DE93-007704; LBL-33356; CONF-920735-5) Avail: CASI HC A02/MF A01

A first-principles quasiparticle approach to the electronic excitation energies in crystals and at surfaces is described. The quasiparticle energies are calculated within the GW approximation for comparison with photoemission and other spectroscopic experiments. Applications of the method to bulk semiconductors and the Si(111)2x1, Ge(111)2x1, and H/Si(111) surfaces are presented. In both cases, significant self-energy corrections arising from many-electron effects to the excitation energies are found. Using atomic positions from total energy minimization, the calculated excitation energies explain quantitatively the experimental spectra. This approach provides an ab initio means for analyzing and predicting results from spectroscopic probes. DOE

MICROSTRUCTURAL UNDERSTANDING AND CRITICAL CURRENT OPTIMIZATION OF ADVANCED HIGH FIELD SUPERCONDUCTORS
L. A. Bonney, T. C. Willis, and D. C. Larbalestier 1993 17 p
(Contract DE-FG02-86ER-52131)
(DE93-011046; DOE/ER-52131/13) Avail: CASI HC A03/MF A01

It is of great importance to improve critical current density, J(sub c) in A15 superconductors for high field magnet applications. Most current work to improve J(sub c) in A15 wires concentrates on increasing the overall J(sub c) by increasing the fraction of superconducting phase in the wire, by improving the uniformity of the superconductor cross section along the length of the wire, and by adjusting the strainstate of the A15 layer. The goal of the A15 work in this group was to investigate the intrinsic J(sub c) of the A15 layer itself. To do this, a better understanding of factors controlling the intrinsic J(sub c) of the Nb3Sn was pursued. DOE

ENHANCEMENTS OF THE CRITICAL CURRENTS OF YBaCuO SINGLE CRYSTALS BY NEUTRON (n) AND PROTON (p) IRRADIATION
B. M. Vlcek, M. C. Frischherz, H. K. Vishwanathan, U. Welp, G. W. Crabtree, and M. A. Kirk 1992 5 p Presented at the Applied Superconductivity Conference, Chicago, IL, 23-28 Aug. 1992
(Contract W-31-109-eng-38)
(DE93-007892; ANL/MSD/CP-78800; CONF-920802-51) Avail: CASI HC A01/MF A01

Results of magnetization hysteresis and T(sub c) measurements of neutron and proton irradiated YBaCuO single crystals are presented. The crystals used for comparison were irradiated to a fluence of 2 x 10(exp 17) n/sq cm (n,E is greater than 0.1 MeV) and 1 x 10(exp 16) p/sq cm (p,E = 3.5 MeV). The critical currents at 1T and 10K are enhanced by a factor of 5 for the neutron irradiated and a factor of 9 for the proton irradiated sample respectively. After irradiation the crystals were annealed at 100, 200, and 300 C for 8h each in air. Following each annealing step the critical temperature and the magnetization hysteresis at 10 and 70K was measured. Upon annealing, a decrease of the critical currents, which is more pronounced for the proton irradiated sample was observed. This decrease is related to the removal of point defects or their small clusters. Thus, their contribution to pinning can be studied. The critical temperature decreases after both types of irradiation by about 0.5K and is fully recovered after annealing. DOE

GROWTH, CHARACTERIZATION AND DEVICE DEVELOPMENT IN MONOCRYSTALLINE DIAMOND FILMS Quarterly Letter Report, 1 Jan. - 31 Mar. 1993
R. F. Davis, J. T. Glass, R. J. Nemanich, and R. J. Trew 31 Mar. 1993 24 p
(Contract N00014-90-J-1604)
(AD-A263204) Avail: CASI HC A03/MF A01

Silicon-germanium films have been grown by electron-beam deposition on naturally occurring p-type semiconducting diamond (OO1) substrates. As evidenced by low-energy electron diffraction and scanning tunneling microscopy, the SiGe layers were polycrystalline. Corresponding current-voltage (I-V) measurements conducted at room temperature demonstrated the formation of a low-barrier rectifying contact. Consistent with the observed low-barrier height, the I-V measurements recorded at 300 C exhibited ohmic-behavior. In addition, subsequent post-growth annealing of the SiGe contacts at 850 C in ultra-high vacuum showed an apparent degradation in the I-V characteristics. Microwave performance of p-type diamond MESFET's is under investigation. A simulation program is being developed to enable a realistic evaluation of diamond MESFETs for high temperature and RF power applications. The program currently accounts for incomplete activation and will eventually account for all physical phenomena believed to be significant, including thermal and breakdown effects. DTIC

NEUTRON SCATTERING STUDIES OF THE STRUCTURES AND LATTICE DYNAMICS OF THE ALKALI METALS
H. G. Smith, R. Berliner (Missouri Univ., Columbia.), and J. Trivisonno (John Carroll Univ., Cleveland, OH.) 1992 7 p Presented at the International Conference on Martensitic Transformations, Monterey, CA, 20-24 Jul. 1992
(Contract DE-AC05-84OR-21400)
(DE93-008272; CONF-920722-5) Avail: CASI HC A02/MF A01

The crystal structures, phonon behavior, and pre-martensitic behavior of Li, Na, K, Rb, and Cs as a function of temperature and pressure (Li, Na, Rb, and Cs) are reviewed. Li has been shown to partially transform to the 9R (Sm-type) structure in the vicinity of 75 K and then partially to fcc on annealing. Its (Tc) increases with applied pressure. Na, on the other hand, partially transforms to a mixture of 9R and nearly hexagonal R-polytypes, which approach hcp on annealing. Its (Tc) is rapidly suppressed by application of modest pressures. No martensitic or pre-martensitic phenomenon, or phonon anomaly, has been observed in K down to 5 K. Also, a search for CDW's in the vicinity of (110) has been inconclusive. Similar negative results have been obtained for Rb. DOE

QUANTUM LATTICE FLUCTUATIONS IN A 1-DIMENSIONAL CHARGE-DENSITY-WAVE MATERIAL: LUMINESCENCE AND RESONANCE RAMAN STUDIES OF AN MX SOLID
F. H. Long, S. P. Love, and B. I. Swanson 1993 7 p Presented at the OE/LASE 1993: International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract W-7405-eng-36)
(DE93-007362; LA-UR-93-0003; CONF-930159-10) Avail: CASI HC A02/MF A01

Luminescence spectra, both emission and excitation, and the excitation dependence of the resonance Raman (RR) spectra were measured for a 1-dimensional charge-density-wave solid, (Pt(L)2Cl2))(Pt(L)2)(ClO4))4; L = 1,2- diaminoethane. The luminescence experiments support the existence of tail states in the band gap region, which indicate the presence of disorder. In contrast, the RR measurements conclusively demonstrated that the effects of static structural disorder on the vibrational spectroscopy can be neglected. This apparently paradoxical result can be explained by considering the zero-point motion of the lattice. The experimental results are compared to recent theoretical models. DOE

FLUX LATTICE RELAXATION, NOISE, AND SYMMETRY-BREAKING IN FRUSTRATED JOSEPHSON JUNCTION ARRAYS
N. Gronbech-Jensen, A. R. Bishop, and P. S. Lomdahl 1993 16 p Presented at the Field Theory and Collective Phenomena, Perugia, Italy, May 1992
(Contract W-7405-eng-36)
(DE93-008713; LA-UR-93-460; CONF-9205310-1) Avail: CASI HC A03/MF A01

The purpose of the present report is to study: (1) Relaxation from an initially random flux state. We wish to exhibit the multiple length and time scales involved in this relaxation, and the influence of thermal fluctuations. This noisy relaxation is controlled by the dynamics of various mesoscopic 'defect' structures defined with respect to the underlying ground-state flux structure. The defects, their mesoscopic collective patterns, and their dynamics control a complex macroscopic response, but are themselves microscopically controlled by the competitions producing the ground-state flux completely. Such multiscale-responses have been observed in other competing interaction systems e.g., spin glasses, random field magnets, and weakly pinned charge-density waves, as well as noisy responses in high-temperature superconductors. Various 'creep' and 'stretched-exponential' regimes have been proposed, as well as phenomenological scaling theories attempting to relate spatial domain sizes with temporal scales. (2) Noisy (i.e.,multitime-scale) voltages responses, and their relation to multilength scales, in current driven JJA's in the presence of a uniform extended magnetic field which frustrates the flux order. ULTRAFAST OPTICAL STUDIES OF SURFACE REACTION PROCESSES AT SEMICONDUCTOR INTERFACES
R. J. D. Miller Mar. 1993 6 p
(Contract DE-FG02-91ER-14185)
(DE93-009049; DOE/ER-14185/2) Avail: CASI HC A02/MF A01

Rectifying properties of semiconductor liquid junctions make them a simple system for converting and storing optical energy. However, interfacial electron or hole carrier transfer and competing non-radiative (energy loss) channels are not well understood at surfaces. This research has explored the use of three optical techniques, Surface Space Charge Electrooptic Sampling, Surface Restricted Transient Grating Spectroscopy, and Femtosecond Optical Kerr Spectroscopy (OKE) to obtain time evolution of the surface spatial distribution of photogenerated charge carriers, photocarrier population dynamics at semiconductor interfaces, and solvent modes responsible for charge localization and separation. These studies have shown that carriers arrive at GaAs(100) surfaces on the hundred femtosecond time scale. Improvements in time resolution, using surface grating spectroscopy, have shown interfacial hole transfer is occurring on the picosecond time scale. The OKE approach to solvent dynamics has determined that the response of water to a field is multiexpontential with a major relaxation component of 100 femtoseconds. The observed interfacial hole transfer to Se(-2) acceptors is occurring on this same time scale. This observation illustrates charge transfer processes can occur in the strong electronic coupling limit and can be competitive with carrier thermalization. DOE

THE SYNTHESIS AND AB INITIO STRUCTURE DETERMINATION OF Zn4O(BO3)2: A MICROPOROUS ZINCOBORATE BUILT UP FROM FUSED 3-RING AND 5-RING SUB-UNITS Technical Report, 1 Jun. 1992 - 31 May 1993
William T. Harrison, Thurman E. Gier, and Galen D. Stucky 15 Feb. 1993 18 p
(Contract N00014-90-J-1159; NSF DMR-92-08511)
(AD-A262504; T-6) Avail: CASI HC A03/MF A01

The synthesis and structure of Zn4O(BO3)2, a new, neutral-framework, microporous zincoborate are reported. The crystal structure of Zn4O(BO3)2 has been solved ab initio from laboratory X-ray powder diffraction data, and consists of a network of vertex-sharing tetrahedral ZnO4 and triangular BO3 moieties enclosing interlinked, 'cigar'-shaped cages and a three-dimensional network of intersecting channels (minimum diameter approx. 3.5 A). The 'fused' 3-ring/5-ring connectivity of the Zn/B/O framework is novel. Crystal data: Zn4O(BO3)2, M sub r = 384.37, rhombohedral, space group R3c (No. 167), a = 9.9115(4) A, alpha = 48.602(1) deg, V = 502.61 A sup 3, Z = 3, R sub p = 10.9%, R sub wp = 14.2% for 4198 powder data (Cu K alpha radiation, lambda = 1.54178 A). UNIAXIALLY STRESSED Ge:Ga AND Ge:Be Ph.D. Thesis
O. D. Dubon, Jr. Dec. 1992 97 p
(Contract DE-AC03-76SF-00098)
(DE93-010426; LBL-33454) Avail: CASI HC A05/MF A02

The application of a large uniaxial stress to p-type Ge single crystals changes the character of both the valence band and the energy levels associated with the acceptors. Changes include the splitting of the fourfold degeneracy of the valence band top and the reduction of the ionization energy of shallow acceptors. In order to study the effect of uniaxial stress on transport properties of photoexcited holes, a variable temperature photo-Hall effect system was built in which stressed Ge:Ga and Ge:Be could be characterized. Results indicate that stress increases the lifetime and Hall mobility of photoexcited holes. These observations may help further the understanding of fundamental physical processes that affect the performance of stressed Ge photoconductors including the capture of holes by shallow acceptors. DOE

SURFACE DIFFUSION: ATOMISTICS AND SURFACE MORPHOLOGY (SUMMARY OF MRS SYMPOSIUM B PANEL DISCUSSION)
M. H. Grabow, bj145143, G. H. Gilmer (Bell Telephone Labs., Inc., Murray Hill, NJ.), P. J. Feibelman, and B. H. Cooper (Cornell Univ., Ithaca, NY.) 1993 10 p Presented at the Materials Research Society (MRS) Symposium, Boston, MA, 2-6 Dec. 1992
(Contract DE-AC04-76DP-00789)
(DE93-009862; SAND-93-0341C; CONF-921206-12) Avail: CASI HC A02/MF A01

The paper gives some of the highlights of a panel discussion on surface diffusion held November 30, 1992 at the Fall MRS Meeting in Boston, Massachusetts. Four invited speakers discussed computer modeling techniques and scanning tunneling microscopy experiments that have been used to provide new understanding of the atomistic processes that occur at surfaces. We present a summary of each of the invited talks, indicate other presentations on surface diffusion in this proceedings, and provide a transcript of the two discussion sessions. DOE

A SPECTRAL METHOD DETERMINATION OF THE FIRST CRITICAL RAYLEIGH NUMBER FOR A LOW-PRANDTL NUMBER CRYSTAL MELT IN A CYLINDRICAL CONTAINER
C. M. Dietz, Jr. and P. Diplas Jul. 1993 133 p
(Grant NAG1-1084)
(NASA-CR-193238; NAS 1.26:193238) Avail: CASI HC A07/MF A02

The onset of laminar axisymmetric Rayleigh-Benard convection is investigated for a low-Prandtl number liquid metal in a cylindrical container. All surfaces are considered to be solid and no-slip. Two separate cases are examined for the thermal boundary conditions at the side wall, one with conducting and the other with insulated surface. The governing Boussinesq system is first perturbed and then simplified by introducing a Stokes stream function. Subsequently, a Chebyshev Galerkin spectral model is employed to reduce the simplified system to a system of first-order nonlinear ordinary differential equations. A local stability analysis determines the two values of the first critical Rayleigh number, Ra(sub cl), for the insulated and conducting side walls. As expected, the conducting Ra(sub cl) value of 2882.5 obtained from the present approach exceeded the corresponding insulated Ra(sub cl) value of 2331.6. For the insulated case, an earlier study using a different numerical approach suggests that Ra(sub cl) = 2261.9, while an experimental study measured Ra(sub cl) = 2700. Author

STRUCTURE AND SWITCHING DYNAMICS IN FERROELECTRIC CRYSTAL AND LIQUID CRYSTAL THIN FILMS Final Report, Dec. 1989 - 1992; Progress Report 1 Jul. - 31 Dec. 1992
Noel A. Clark and James F. Scott Mar. 1993 15 p
(Contract DAAL03-90-G-0002)
(AD-A263664) Avail: CASI HC A03/MF A01

The structure and switching dynamics of ferroelectric solid state and liquid crystal thin films were investigated experimentally using x-ray scattering, dielectric measurements, and optical microspectroscopy. Crystalline piezoelectric ferroelectric films, formed by sol-gel and sputter deposition, were developed and analyzed for application as high speed nonvolatile memories. Ferroelectric liquid crystal devices were studied for application as fast electro-optic light valves in spatial light modulator applications. A novel thermo-optical effect in ferroelectric lead magnesium niobate suitable for use in pressure sensing applications was discovered. DTIC

HIGH-DOSE IMPLANTATIONS OF Al INTO Si(111) AND Si(100)
R. S. Daley and R. G. Musket 14 Dec. 1992 14 p Presented at the 8th International Conference on Ion Beam Modification of Materials, Heidelberg, Germany, 7-11 Sep. 1992
(Contract W-7405-eng-48)
(DE93-009552; UCRL-JC-110338; CONF-9209200-8) Avail: CASI HC A03/MF A01

High dose implants of Al (0.5(10)(exp 18) to 2.0(10)(exp 18)/sq cm) at 200 keV into silicon substrates at 375 C were performed in an attempt to form a pure, monocrystalline buried layer of Al in silicon, upon post-implant annealing. Nuclear reaction analysis (NRA) and Auger electron spectroscopy (AES) were used to determine the Al concentration and morphology as a function of depth. Results show a peak Al concentration of 83 at.% at a depth of approximately 350 run for the highest dose, and the morphology of the Al is of an interconnected network of 100 at.% Al. Failure to form a continuous elemental layer is explained by the as-implanted morphology resulting thermally induced precipitate coarsening rate at 375 C. Formation of large, stable, individual Al precipitates was thermodynamically favored for the implant conditions and effectively precluded coalescence into a continuous layer. DOE

INVESTIGATION OF ION BEAM MIXING OF IRON MARKER LAYERS IN ALUMINUM OXIDE BY RBS
E. A. Cooper, M. Nastasi, and K. E. Sickafus 1993 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. -

5 Dec. 1992
(Contract W-7405-eng-36)
(DE93-010727; LA-UR-93-985; CONF-921101-107) Avail: CASI HC A02/MF A01

Thin films made with a thin embedded marker layer of iron or iron oxide in amorphous alumina were ion mixed with 210 keV Ar over a temperature range of RT to 750 C in vacuum. The dose range was 5(10)(exp 15) - 7(10)(exp 16) ions/sq cm with an average dose rate of 4.5(10)(exp 12)ions/sq cm-sec. The resulting marker distributions were analyzed using RBS. Spreading of the iron RBS peak due to mixing into the alumina matrix was observed in the Fe2O3 marker samples and was clearly seen to be a function of temperature (greater than 400 C) and dose, whereas for the Fe marker sample, no such temperature dependence was observed. An activation energy for the thermally assisted ion mixing in the Fe2O3 marker sample was determined to be 0.69 eV in comparison to an activation energy of 1.77 eV for samples that underwent only a thermal treatment. DOE

IN-SITU X RAY STUDIES OF THE UNDERPOTENTIAL DEPOSITION OF COPPER ON PLATINUM (3)
Howell S. Yee and Hector D. Abruna 1992 51 p Sponsored in part by NSF, Offices of Naval and Army Research
(AD-A263361) Avail: CASI HC A04/MF A01

In-situ x-ray fluorescence detected surface EXAFS spectroscopy has been employed to elucidate the in-plane structure of copper underpotentially deposited on a clean and well ordered platinum (111) single crystal electrode. XANES and EXAFS analyses were made as function of applied potential (+O.2V, +O.1V, and O.OV) corresponding to coverages of approximately 0.5ML, 0.75ML, and 1ML, respectively. The charge derived from electrochemical measurements indicate that at the three potentials studied, the electrodeposited copper was not completely discharged. The XANES analysis revealed similarities between the electrodeposited copper and the Cu2O reference lending support to earlier findings of a partially discharged copper ad-layer. EXAFS results suggest two cluster phases at the most positive potential (+O.2V) studied and an epitaxial arrangement at the most negative potential (O.OV). DTIC

PROCESSING AND PROPERTY EVALUATION OF SILVER OR ALUMINUM MATRIX YBa2Cu3O(6+x) SUPERCONDUCTING MATERIALS
A. S. Rao Mar. 1993 56 p
(AD-A263382; CARDEROCKDIV-SSM-61-93/05) Avail: CASI HC A04/MF A01

In order to **understand the physical behavior at the atomistic level of the superconducting metal matrix composites,** both aluminum/YBa2CU3O(6+x) and silver/YBa2CU3O(6+). composites have been investigated. The results suggest that silver forms superconducting composites in the concentration range 10-72 wt. %. The aluminum based composites showed the superconducting property only for composites containing 60 wt.% aluminum and 40 wt. % YBa2CU3O(6+x) In addition, it was found that the superconducting behavior of the aluminum YBa2CU3O(6+x) composites is very sensitive to the sintering temperature and the duration of sintering. REAL TIME SELF-DIRECTED MBE FLUX CONTROL INCORPORATION IN SITU ELLIPSOMETRY, PHASE 1 Final Report, 27 May - 27 Nov. 1992
David Palaith and Jeffrey J. Heyob Nov. 1992 141 p
(Contract F33615-92-C-5942)
(AD-A263501; APL-UW-TR-9212; WL-TR-93-4039) Avail: CASI HC A07/MF A02

The objective of this program was to achieve real-time control of thin film properties during deposition by the molecular beam epitaxy (MBE) method. Satisfying this objective required development of techniques that would permit rapid and accurate control of the beam fluxes of the chemical constituents of the growing film. This objective of precise flux control was to be achieved by the following means: (1) using self-directed temperature and shutter control, and (2) employing ellipsometry for direct monitoring and feedback over alloy composition and film thickness. DTIC

QUANTUM DEVICES USING Si-BASED SUPERLATTICES AND STRUCTURES
Kang L. Wang and Gamani Karunasiri 4 Feb. 1993 26 p
(Contract DAAL03-89-K-0167)
(AD-A263700; ARO-26896.11-EL) Avail: CASI HC A03/MF A01

The purpose of the research was to perform scientific study and experimentation on potential new Si-based devices for future optical and electronic applications. The research areas included detectors, sources, new properties, and other quantum devices using Si molecular beam epitaxy (Si-MBE) based superlattices and superstructures. With the current ARO support, significant advances in the understanding of optical properties of intersubband transition of SiGe/Si multiple quantum wells, and the fabrication of multiple quantum well infrared detectors operating in the mid infrared range were made. Large many-body effects were observed in heavily doped Si and SiGe/Si quantum well structures. Normal incidence intersubband transitions were demonstrated for both n and p type SiGe/Si quantum well structures. For potential realization of Si-based light sources, the luminescence from monolayer superlattices and strained alloy layers was studied. In the area of quantum transport, a resonant tunneling transistor was demonstrated. DTIC

AMBIENT-ATMOSPHERE COMPATIBLE SUPERCONDUCTING FULLERENES
T. A. Miller 22 Feb. 1993 68 p
(Contract DASG60-92-C-0087)
(AD-A262025) Avail: CASI HC A04/MF A01

The goal of this phase 1 project was to evaluate different methods to produce ambient-atmosphere compatible superconducting fullerenes. Three approaches toward this goal were surveyed: (1) protective overlayers; (2) in-cage dopants; and (3) alternate dopants. A source of electrons for the conduction band derived from the lowest unoccupied molecular orbitals, other than reactive alkali metals, is desired. All three methods demonstrated interesting and tantalizing results. Potassium doped fullerene films were produced in our high vacuum (HV) deposition chamber. Difficulties in transporting potassium from the shipping container to the deposition chamber were solved by using a kerosene/isopropanol bath. Measuring electric resistivity proved to be an effective method of monitoring the doping process. Protective overlayers of doped fullerence films were formed with various combinations of electrical conductors and insulators. The electrically insulating layers could be tested immediately at MER, while the metallic layers required cryogenic measurements. DTIC

DEFECT STUDIES IN LOW-TEMPERATURE-GROWN GaAs Ph.D. Thesis
D. E. Bliss Nov. 1992 201 p
(Contract DE-AC03-76SF-00098)
(DE93-010405; LBL-33378) Avail: CASI HC A10/MF A03

High content of excess As is incorporated in GaAs grown by low-temperature molecular-beam-epitaxy (LTMBE). The excess As exists primarily as As antisite defects AsGa and a lesser extent of gallium vacancies V(sub Ga). The neutral AsGa-related defects were measured by infrared absorption at 1 micron. Gallium vacancies, V(sub Ga), was investigated by slow positron annihilation. Dependence of defect contents on doping was studied by Si and Be dopants. No free carriers are generated by n-type or p-type doping up to 10(exp 19)/cc Si or Be. Raman data indicate Be occupies Ga substitutional sites but Si atom is not substitutional. Si induces more As(sub Ga) in the layer. As As(sub Ga) increases, photoquenchable As(sub Ga) decreases. Fraction of photoquenchable defects correlates to defects within 3 nearest neighbor separations disrupting the metastability. Annealing reduces neutral As(sub Ga) content around 500 C, similar to irradiation damaged and plastically deformed Ga(sub As), as opposed to bulk grown GaAs in which As(sub Ga)-related defects are stable up to 1100 C. The lower temperature defect removal is due to V(sub Ga) enhanced diffusion of As(sub Ga) to As precipitates. The supersaturated V(sub Ga) and also decreases during annealing. Annealing kinetics for As(sub Ga)-related defects gives 2.0 +/- 0.3 eV and 1.5 +/- 0.3 eV migration enthalpies for the As(sub Ga) and V(sub Ga). This represents the difference between Ga and As atoms hopping into the vacancy. The non-photoquenchable As(sub Ga)-related defects anneal with an activation energy of 1.1 +/- 0.3 eV. Be acceptors can be activated by 800 C annealing. Temperature difference between defect annealing and Be activation formation of As(sub Ga)-Be(sub Ga) pairs. Si donors can only be partially activated. DOE

DESIGN AND PERFORMANCE EVALUATION OF A GAS CHROMATOGRAPH MICROMACHINED IN A SINGLE CRYSTAL SILICON SUBSTRATE Ph.D. Thesis

Rocky R. Reston Mar. 1993 365 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A262594; AFIT/DS/ENG/93M-01) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A miniature gas chromatograph (GC) using silicon micromachining techniques was designed and developed. The GC is composed of a miniature sample injector (10 micro-l sample loop); a 0.9 m long, rectangular-shaped (300 micrometers width and 10 micrometers height) capillary column coated with a 0.2 micrometer thick copper phthalocyanine (CuPc) stationary phase; and a dual-detector scheme incorporating a CuPc-coated chemiresistor and a 125 micrometer diameter thermal conductivity detector bead. Micromachining was employed to fabricate the sample injector interface, the GC column, and the dual-detector cavity. A processing technique was developed to sublime the CuPc stationary phase coating on the GC column walls. The miniature GC system was used to separate parts-per-million ammonia and nitrogen dioxide concentrations in less than 30 minutes (10 microliters sample injected at 40 psi). A secondary discovery was the heat of adsorption of nitrogen dioxide (0.38 eV) on a polycrystalline CuPc film (0.2 micrometer thick). This research demonstrated the utilization of a miniature GC to investigate the adsorptive properties of thin films. Also, the time-domain performance model of the miniature GC developed will facilitate the optimization of future miniature GC designs. DTIC

CHARACTERIZATION OF COPPER IODIDE THIN FILMS FABRICATED VIA LASER ASSISTED MOLECULAR BEAM EPITAXY

W. M. Weijekoon, M. Y. Lyktey, P. N. Prasd, and James F. Garvey 3 Apr. 1993 24 p
(Contract N00014-88-K-0483)
(AD-A262823; TR-42) Avail: CASI HC A03/MF A01

For the first time the technique laser assisted molecular beam epitaxy (LAMBE) has been used to fabricate a molecular film by reaction in a molecular beam. Molecular iodine vapor entrained into a stream of helium carrier gas was introduced via a supersonic expansion into the plasma plume of laser evaporated copper to produce copper iodide. Films were deposited on substrates that were situated about 3 cm downstream on the path of the molecular beam. The surface morphology of films depends greatly on the fluence of the incident laser beam and expansion conditions. Films grown at low laser powers show small surface inhomogeneities in their electron micrographs compared to the films that were grown at higher laser powers. Copper in the LAMBE films is found to be mainly in the Cu(+) state as characterized by electron spectroscopy for chemical analysis (ESCA). A comparison of the surface and structural properties of LAMBE films with that of a vacuum evaporated film suggests both films have similar lattice structures and compositions. It seems that LAMBE can be a powerful technique to deposit novel molecular and composite films for electronics and photonics. DTIC

ELECTRIC FIELD INDUCED PHENOMENA IN STM: TIP DEFORMATIONS AND Au(111)-SURFACE PHASE TRANSITIONS DURING TUNNELING SPECTROSCOPY EXPERIMENTS Technical Report, 30 Jun. 1992 - 31 Mar. 1993

Joachim H. Schott and Henry S. White 20 Mar. 1993 34 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1927)
(AD-A262208; TR-10) Avail: CASI HC A03

We report electric field induced phase transitions of Au(111) surfaces and electric field stress induced elongations of Pt-Ir and Au tips during current voltage measurements with an STM in air. Transitions between the reconstructed square root of 3 x 22 and the unreconstructed 1 x 1 phase of the Au(111) surface are attributed to changes in the electronic surface excess charge density induced by the electric field between tip and sample. Elongations of STM tips during tunneling spectroscopy give rise to a distinct nonlinear current-voltage response at tip-to-sample biases greater than approximately the absolute value of 0.5V. Similar behavior is observed during tunneling measurements on pyrolytic graphite and oxidized Ag surfaces. Extensive elongations can result in tip-sample point-contact and tip-fracture. Artificially low values of the apparent barrier height are shown to result from tip elongation. DTIC

ANELASTIC RELAXATIONS ASSOCIATED WITH LOCAL DISORDERING IN GRAIN BOUNDARIES

Bolin Cheng and Tingsui Ge 2 Apr. 1993 14 p Transl. into ENGLISH from Jinshu Xuebao (China), v. 26, no. 5, 1990 p 317-322
(AD-A263101; FASTC-ID(RS)T-0308-92) Avail: CASI HC A03/MF A01

Internal friction and micro-creep measurements were performed with high-purity Al bamboo-crystal specimens. The relaxation strength was found to decrease with the decrease of the temperature of measurement and became zero at about 0.4 T sub m, (T sub m being melting temperature). This reflects the occurrence of local disordering in the bamboo boundary region at this temperature. This result conforms to the picture of grain boundary disordering constructed by atomic simulation studies. DTIC

FERROELECTRIC LIQUID CRYSTAL OPTICAL INTERCONNECT SWITCHING SYSTEMS Final Report, 1 Jul. 1990 - 31 Dec. 1992

Joseph W. Goodman 26 Feb. 1993 7 p
(Contract DAAL03-89-K-0102)
(AD-A263751; ARO-26695.7-PH) Avail: CASI HC A02/MF A01

This grant explored the possible use of ferroelectric liquid crystals (FLC's) in the reamization of photonic switching fabrics. Problems addressed included device fabrication, switch architectures, and switch performance. Experimental versions of most architectures were constructed. The aim of the contract was to develop techniques for using ferroelectric liquid crystals (FLC's) for novel photonic switching architectures. Initial work was devoted to mastering the technology of making FLC polarization rotation shutters, which formed the basis for the switching architecture work to follow. Much of this work was performed using the facilities of Stanford's Center for Integrated Systems. We were able to build such shutters with respectable properties, including reasonable uniformity, insertion losses of the order X dB, and extinction ratios of the order of Y db. Switching speeds observed were on the order of ZZZ. Having mastered the basic shutter technology, we moved on to employing such shutters in novel architectures. DTIC

Martens (IBM Research Lab., San Jose, CA.) Dec. 1992 2 p Presented at the 17th Annual Society of Photo-Optical Instrumentation Engineers (SPIE) International Conference on Infrared and Millimeter Wave Sources, Pasadena, CA, 14-18 Dec. 1992
(Contract DE-AC03-76SF-00098)
(DE93-010430; LBL-33557; CONF-921217-6) Avail: CASI HC A01/MF A01

We have used a novel bolometric technique and a resonant technique to obtain accurate submillimeter and microwave residual loss data for epitaxial thin films of YBa2Cu3O7, Tl2Ca2Ba2Cu3O10 and Tl2CaBa2Cu2O8. For all films we obtain good agreement between the submillimeter and microwave data, with the residual losses in both the Y-Ba-Cu-O and Tl-Ca-Ba-Cu-O films scaling approximately as frequency squared below approximately 1 THz. We are able to fit the losses in the Y-Ba-Cu-O films to a two fluid and a weakly coupled grain model for the a-b plane conductivity, in good agreement with results from a Kramers-Kronig analysis of the loss data. PROCEEDINGS OF SYMPOSIUM F ON NEW ASPECTS ON THE GROWTH, CHARACTERIZATION AND APPLICATIONS OF CdTe AND RELATED Cd RICH ALLOYS 5, 1992
R. Triboulet, W. R. Wilcox, and O. Oda 1992 333 p Symposium held in Strasbourg, France, 2 Jun. 1992
(Contract DAJA45-92-M-0260)
(AD-A263541; R/D-6882-EE-02) Avail: CASI HC A15/MF A03

This four-day Symposium has provided the opportunity to take stock of the research devoted to CdTe and related Cd-rich alloys (roughly in the band gap energy range 1-2 eV) during the last decade, since the encyclopedic and famous work of De Nobel (1960), the Strasbourg conferences of 1972 and 1977, both dedicated to CdTe, and the excellent monograph of K. Zanio (1977). CdTe exhibits numerous attractive features. It has a band gap of 1.5 eV, just in the middle of the solar spectrum, making it an ideal material for photovoltaic conversion. It also has a high average atomic number of 50, very convenient for nuclear detection. A high electro-optic coefficient is another feature (5.5 for CdTe:V to compare with 1.2 for GaAs:Cr or 1.34 for InP:Fe) allowing high performance electro-optic modulators and photorefractive devices. It can present both types of conductivity (n and p), which makes diode technology and field effect transistors possible, and it has a semi-insulating state as well. DTIC

FUNDAMENTAL STUDIES OF THE MORPHOLOGY, CHEMISTRY, AND ELECTRICAL PROPERTIES OF METALS ON GaAs AND OTHER III-V SEMICONDUCTOR COMPOUNDS Final Report, 1 Oct. 1988 - 30 Sep. 1991
W. E. Spicer and I. Lindau 30 Sep. 1992 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1083; DARPA Order 56743)
(AD-A264417) Avail: CASI HC A03

A large effort has been placed to understand and develop passivation for the III-V surfaces. Although the major objective of these studies, to develop practical passivation for III-V devices other than heterojunctions (e.g. AlGaAs), is still unresolved (due to chemical instability of coatings in atmosphere) large progress in the understanding of many basic phenomena has been made. Our studies concentrated on two avenues. Firstly we explored the use S based solutions (Na2S, (NH4)2S etc.) which markedly reduce surface recombination at the GaAs(100) surface. Secondly we studied the Sb interlayers on both GaAs and InP surfaces as an intermediate reaction barrier for the passivating layer. DTIC

APPLICATIONS OF MESOSCOPIC PHYSICS
Shechao Feng 1993 9 p
(Contract DE-FG03-88ER-45378)
(DE93-012104; DOE/ER-45378/T4) Avail: CASI HC A02/MF A01

Research activities in the area of applications of mesoscopic physics to novel correlations and fluctuations of speckle patterns: imaging and tomography with multiply scattered classical waves are briefly summarized. The main thrust in fundamental research is in the general areas of mesoscopic effects in disordered semiconductors and metals and the related field of applications of mesoscopic physics to the subject matter of classical wave propagation through disordered scattering media. Specific topics are Fabry-Perot interferometer with disorder: correlations and light localization; electron-phonon inelastic scattering rate and the temperature scaling exponent in integer quantum Hall effect; and transmission and reflection correlations of second harmonic waves in nonlinear random media. Research in applied physics centered on far infrared photon-assisted transport through quantum point contact devices and photon migration distributions in multiple scattering media. DOE

PHOTOREFRACTIVE INTEGRATORS AND CORRELATORS Technical Report, Oct. 1990 - Sep. 1992
George A. Brost Dec. 1992 85 p
(DA Proj. LDF-P)
(AD-A264200; RL-TR-92-340) Avail: CASI HC A05/MF A01

The use of photorefractive crystals as optically addressed time integrating spatial light modulators in acousto-optic signal processing applications was examined. Nonstationary recording techniques of alternating electric fields and moving fringe patterns were investigated in detail. A finite difference technique was used to model grating formation characteristics. Photorefractive Bi12SiO20 and BaTiO3 crystals were tested experimentally in an adaptive acousto-optic processor. These results demonstrated the feasibility of using photorefractives for such applications. DTIC

DESIGN OF ACENTRIC MATERIALS: X RAY STRUCTURES OF GUANIDINIUM P-NITRO- AND P-HYDROXYBENZENESULFONATE Technical Report, 1 Jun. 1992 - 31 May 1993
V. A. Russell, M. C. Etter, and M. D. Ward 22 Apr. 1993 7 p
(Contract N00014-89-J-1301; DA Proj. 4135)
(AD-A264220; TR-24) Avail: CASI HC A02/MF A01

Guanidinium p-nitro- and p-hydroxybenzenesulfonate crystallize in noncentros (acentric) space groups and exhibit second-harmonic generation. The engineering of these structures was accomplished using hydrogen bonding and the tendency to pack in centrosymmetric structures overcome by screening of the dipolar forces between arylsulfonates by charged layers of guanidinium ions. DTIC

SENSITIVE DETECTION OF NEW SUPERCONDUCTORS CREATED AT ULTRA HIGH PRESSURES Final Report, 1 Aug. 1990 - 31 Jan. 1993
Sheldon Schultz 31 Jan. 1993 9 p
(Grant AF-AFOSR-0365-90)
(AD-A264340; AFOSR-93-0246TR) Avail: CASI HC A02/MF A01

In the original proposal we presented the evidence that by utilizing Low Field Modulated Microwave (LFMM) spectroscopy we could sensitively detect the onset of superconductivity in either films, pellets, or single crystals. The technique does not require leads, nor a percolation path, and is unperturbed by the presence of other non-superconducting phases. We suggested that by incorporating this technique in conjunction with the diamond anvil cell approach to high pressures, we could open up new opportunities for rapidly and sensitively studying the significant phase space corresponding to the pressure axis. The primary goal was to detect new normal metal to superconducting phase transitions, starting for example, with those copper compounds for which interesting transitory pressure effects had been reported many years prior to the discovery of the superconducting cuprates. THE 2-6 SEMICONDUCTOR SUPERLATTICES Final Report, 1 Dec. 1989 - 30 Nov. 1992
R. L. Gunshor and N. Otsuka 1 Dec. 1992 25 p
(Grant AF-AFOSR-0438-89)
(AD-A264343; AFOSR-03-0245TR) Avail: CASI HC A03/MF A01

The first operational semiconductor diode lasers were demonstrated in the summer of 1991 independently by two U.S. groups, one at 3M and the other a team effort shared by Purdue and Brown Universities. As a result of the close collaboration between MBE and TEM groups within the grant, the structures for lasing and LED (as well as display device) operation were realized with the lowest defect concentrations ever reported for 2-6 structures grown on GaAs by MBE. The reduction of the dislocation levels resulted from an iterative process where the growth could be modified in response to the TEM analysis. The AFOSR funded interface studies have led to our appreciation of the electrical and microstructural considerations obtaining at 2-6/3-5 heterovalent interfaces. As a result the Purdue/Brown group has had equal success in making laser diodes with substrates of both doping types. The Purdue/Brown collaboration has obtained CW operations at 77 K as well as pulsed operation at room temperature using a Zn(S,Se)-based device configuration emitting in the blue (490 nm at room temperature). ADVANCED MICROWAVE FREQUENCY SOURCES AND FILTERS BASED ON SUPERCONDUCTING PHOTONIC BAND GAP (PBG) STRUCTURES Final Report, 1 Jul. - 31 Dec. 1992
Duane Crum, Joseph Anderberg, and S. Schultz 16 Mar. 1993 16 p
(Contract F49620-92-C-0045)

(AD-A264404; Rept-92SBIRPBGFinal; AFOSR-93-0291TR) Avail: CASI HC A03/MF A01

The applicability of photonic band gap structures in high Q resonators has been studied. A review of numerical simulations, experiments, and system design studies are presented. These results confirmed the technical feasibility of utilizing, 2-D photonic band gap structures with high temperature superconducting end plates as high Q resonators for fabricating low phase noise oscillators. A particularly important result of the numerical simulations is that inverse structures (dielectric host with air holes) exhibited useful photonic band gap properties. Experiments performed at 10 GHz demonstrated two methods of modulating the defect mode frequency. A supplier of high temperature superconducting films, suitable for millimeter-wave photonic band gap resonators has agreed to collaborate with Tristan Technologies in a Phase 2 effort. Potential commercial and government applications for photonic band gap resonators with high temperature superconducting end plates have been identified. DTIC

A HIGH RESOLUTION 14-BIT ADC FOR GAMMASPHERE PROJECT
B. T. Turko, A. A. Arthur, J. E. Galvin, M. R. Maier, and G. J. Zizka Oct. 1992 5 p Presented at the IEEE Nuclear Science Symposium and Medical Imaging Conference, Orlando, FL, 26-31 Oct. 1992
(Contract DE-AC03-76SF-00098)
(DE93-010446; LBL-32246; CONF-921005-32) Avail: CASI HC A01/MF A01

A system of 110 high performance A/D converters, required for the Gammasphere Project at the Lawrence Berkeley Laboratory, is described. The ADC's are compact, linear plus/minus 0.006% integral, plus/minus 0.5% differential, with a conversion deadtime of 5.3 micro-s and channel profile flatness of 50% over a 13-bit range. The converter is based on a new low power (0.25 W), low cost, monolithic high speed sampling ADC, exibiting a very high stability and no missing codes over the entire 16-bit range. Differential linearity was achieved by applying the 'Gatti method', covering a 8-bit range. Measured data and methods of testing the ADC are also presented. DOE

SYNTHESIS AND CHARACTERIZATION OF MIXED 3-5 AND 2-6 SEMICONDUCTOR MONOMERS INCLUDED IN THE BORATE SODALITE ANALOGUE Technical Report, 1 Jun. 1992 - 31 May 1993
K. L. Moran, T. E. Gier, W. T. Harrison, G. D. Stucky, and H. Eckert 30 Apr. 1993 27 p
(Contract N00014-90-J-1159)
(AD-A264523) Avail: CASI HC A03/MF A01

The synthesis of the solid solution series Ga(x)Zn(8-x)(BO2)12P(x)Se(2-x) (x = 0, 0.5, 1, 2) is reported and the local and average long-range structures are discussed based on x-ray diffraction data, UV/visible spectroscopic measurements and a variety of field-dependent static and magic angle spinning and solid state NMR experiments. Inclusion of GaP within the borate sodalite analogue results in the formation of an isolated 31p-69,71 Ga dipolar spin pair that exhibits resolved J-coupling in the 31P MAS NMR spectra. Theoretical analysis reveals that there are four different intracage structures distributed in small domains throughout the crystallographically single phase materials and these are identified as (Zn4Se)(6+), (GaZn3P)(6+), (Zn4 P)(5+) and, by inference, (Ga2Zn2P)(7+). COMPLEX DIELECTRIC FUNCTION OF AMORPHOUS DIAMOND FILMS DEPOSITED BY PULSED EXCIMER (ArF) LASER ABLATION OF GRAPHITE
F. Xiong, Y. Y. Wang, and R. P. Chang May 1993 27 p
(Contract N00014-89-J-1848)
(AD-A264527; TR-13-ONR) Avail: CASI HC A03/MF A01

Amorphous diamond films have been synthesized by pulsed excimer (ArF) laser ablation of graphite at room temperature. Detailed studies of the energy-dependent complex dielectric function in the energy range up to 40 eV have been carried out by Kramers-Kronig dispersion analysis of transmission electron energy loss spectroscopy and spectroscopic ellipsometry. Distinct from those of graphitic amorphous carbon and diamond-like carbon, the optical constants of amorphous diamond films are closely related to that of crystalline diamond, but with a smooth band structure, a decrease in the magnitude strength, and band shift towards lower energies. The variation of dielectric function from crystalline diamond to amorphous diamond is analogue to those of crystalline and amorphous semiconductors such as Si and Ge. The extracted optical energy band gap reaches 2.6 eV, the highest value among the reported results of amorphous carbon films. The implication of dielectric function to the bond structure analysis of a-D films has also confirmed its diamond character. All of these provide further evidence of the existence of amorphous diamond. DTIC

COMPUTATIONAL ANALYSIS OF SLIP IN PETN
J. P. Ritchie 1992 13 p Presented at the 10th Detonation Symposium, Boston, MA, 12-16 Jul. 1993
(Contract W-7405-eng-36)
(DE92-040222; LA-UR-92-2773; CONF-930713-1) Avail: CASI HC A03/MF A01

Analysis of slip over two entire planes in crystalline PETN was performed. It showed that slip on 100 must always result in contacts of 1.2 (Angstrom) or less. In contrast, slip on 110 can occur without such close approaches. Molecular modeling of slip supposed to be stimulated by shocks was also performed. It was found that slip was more difficult (that is costly in energy) and led to greater molecular distortions in the sensitive direction than the insensitive direction. Extensive molecular deformation occurred during slip along either of the directions examined. This information has contributed to our knowledge of the molecular distortions occurring during slip, and may be useful in trying to unravel reactivity patterns. Additional investigations are being performed to examine slip along other directions. Also, dynamical calculations simulating the shock and the motions it induces are in progress. DOE

PHOTOINDUCED CHARGE SEPARATION IN Q1D HETEROJUNCTION MATERIALS: EVIDENCE FOR ELECTRON-HOLE PAIR SEPARATION IN MIXED-HALIDE MX SOLIDS
L. A. Worl, S. C. Huckett, B. I. Swanson, A. Saxena, and A. R. Bishop Mar. 1993 5 p
(AD-A264711) Avail: CASI HC A01/MF A01

Resonance Raman experiments on doped and photoexcited single crystals of mixed-halide MX complexes (M = Pt; X = Cl, Br) clearly indicate charge separation; electron polarons preferentially locate on PtBr segments while hole polarons are trapped within PtCl segments. This polaron selectivity, potentially very useful for device applications, is demonstrated theoretically using a discrete, 3/4-filled, two-band, tight-binding, extended Peierls-Hubbard model. Strong hybridization of the PtCl and PtBr electronic bands is the driving force for separation. DTIC

PHASE SEPARATION, ANTIFERROMAGNETISM, AND SUPERCONDUCTIVITY IN SUPERCONDUCTING-SUPEROXYGENATED La(2-x)Sr(x)CuO(4+(DELTA))
G. H. Kwei, J. A. Goldstone, A. C. Lawson (Los Alamos National Lab., NM.), J. E. Schirber, B. Morosin, E. L. Venturini, and J. A. Voigt 1993 17 p Presented at the Conference on Spectroscopies in Novel Superconductors, Santa Fe, NM, 17-19 Mar. 1993

(Contracts DE-AC04-76DP-00789; W-7405-eng-36)
(DE93-009852; SAND-93-0366C; CONF-930367-2) Avail: CASI HC A03/MF A01

La(2-x)Sr(x)CuO(4+(delta)) with x = 0.01, 0.025, 0.050, 0.10, and 0.16 and excess oxygen delta incorporated by high-pressure O(2) anneals is discussed. These compounds were examined using time-of-flight neutron diffraction data. Various models were fit by Rietveld least-squares refinement, with the maximum amount of delta being only of the order of 10 standard deviations. Delta is largest for x near 0, is zero for x = 0.10 and is intermediate for x = 0.16. Only the sample with x = 0.01 is found to phase separate distinctly into a nearly stoichiometric phase with delta approximately 0 and an oxygen-rich superconducting phase as the temperature is lowered. Coincidence of phase separation and Neel temperature strongly suggests that the phase separation is driven by free energy provided by long-range antiferromagnetic ordering in the nearly stoichiometric, weakly Sr-doped La(2-x)Sr(x)CuO4. The excess oxygen stoichiometry shows that at low values of x, hole doping is provided primarily by the excess oxygen, and is enhanced substantially by phase separation. At larger values of x, excess oxygen is no longer incorporated, and hole doping is provided by the substitution of Sr(+2) for La(+3). DOE

TWO NEW TITANIUM PYROARSENATES: ALPHA-TiAs2O7 AND BETA-TiAs2O7 Technical Report, 1 Jun. 1992 - 31 May 1993
William T. Harrison, Thurman E. Gier, and Galen D. Stucky 20 Apr. 1993 14 p Prepared in cooperation with Houston Univ.
(Contract N00014-90-J-1159)
(AD-A264632) Avail: CASI HC A03/MF A01

Two new titanium pyroarsenate phases, alpha-TiAS2O7 and beta-TiAS2O7, have been prepared by high temperature hydrothermal methods and characterized by single crystal x-ray diffraction techniques. Both structures are based on different three-dimensional networks of vertex-sharing TiO6 octahedra and AsO4 tetrahedra. The TiO6 groups show little distortion from regular octahedral geometry, and the arsenate anions are linked in pairs via As-O-As bonds to form pyroarsenate (As2O7) groups. Alpha-TiAS2O7 is isostructural with a polymorph of SiP2O7; beta-TiAS2O7 is a new structure. DTIC

DEVELOPMENT OF ULTRA-LOW NOISE, HIGH SENSITIVITY PLANAR METAL GRATING COUPLED 3-5 MULTIQUANTUM WELL INFRARED DETECTORS FOR FOCAL PLANE ARRAY STARING IR SENSOR SYSTEMS Quarterly Progress Report No. 7, 1 Feb. 1993 - 30 Apr. 1993
Sheng S. Li 1 May 1993 71 p
(Contract N00014-91-J-1976)
(AD-A264465) Avail: CASI HC A04/MF A01

To develop ultra-low dark current and high detectivity planar metal grating coupled bound-to-miniband (BTM) III-V quantum well infrared photodetectors (QWIP's) for 8 to 12 micron focal plane arrays (FPA's) staring IR sensor systems. To develop novel type-I and type II III-V QWIP's with multicolor, broad and narrow band spectral response in the 8 to 14 micron wavelength range. The material systems to be studied include GaAS/AlGaAs, AlAs/AlGaAs, InGaP/GaAs (by MOCVD) grown on GaAs substrates and InAlAs/InGaAs (MBE) grown on InP substrate. To conduct theoretical and experimental studies of the planar metal grating coupled structures for normal incidence illumination on QWIP's. Different metal grating coupled structures using 1-D (line) and 2-D (square mesh and dot) metal gratings will be studied in order to achieve high coupling quantum efficiency under normal frontside and backside illuminations on QWIP's. To perform theoretical and experimental studies of dark current, photocurrent, optical absorption, spectral responsivity, noise, and detectivity in different types of QWIP's developed under this program. DTIC

DIAMOND NUCLEATION OF SURFACES USING CARBON CLUSTERS
R. J. Meilunas and R. P. Chang May 1993 60 p
(Contract N00014-89-J-1848)
(AD-A264634; TR-12) Avail: CASI HC A04/MF A01

Thin solid films of C(60) and C(70) have been used as nucleation layers for the growth of diamond thin films on a variety of substrate surfaces including metal, insulator, and semiconductors. Compared to other forms of carbon, such as graphite, amorphous carbon, soot, etc., it is found that the nucleation density on C(70) is equivalent to that of diamond seeds themselves. On the other hand, diamond nucleation of C(60) is less favorable. We argue from our experiments that the reason for C(70) to have such favorable nucleating properties is its chemical stability and geometry. A working model is proposed to explain the nucleation of diamond on solid C(70) films. Application of this work extending to the growth of diamond on a wide range of substrates is also discussed. DTIC

ENHANCED PHOTOREFRACTIVE EFFECTS IN BARIUM TITANATE
George A. Brost Dec. 1992 51 p
(AD-A264724; RL-TR-92-314) Avail: CASI HC A04/MF A01

This report documents investigations of characteristics of secondary centers (shallow traps) in BaTiO3, and the possible utilization of these traps for enhanced photorefractive effects at infrared wavelengths. Secondary centers were characterized by photoinduced absorption and two-beam coupling experiments. Two species were identified, with concentrations of approximately 1.5 x 10(exp 17)/cc and 2 x 10(exp 16)/cc. The effect of secondary centers on the sublinear intensity dependence and temperature dependent photorefractive effects were also examined. No enhancements of photorefractive effects were also examined. No enhancements of photorefractive effects from induced population of secondary centers by external pumping were observed. DTIC

N93-30560# North Carolina State Univ., Raleigh. Dept. of Electrical Engineering.
ATOMIC LAYER EPITAXY OF SEMICONDUCTOR HETEROSTRUCTURES Final Report, 15 Sep. 1991 - 14 Sep. 1992
Salah Bedair Nov. 1992 43 p
(Grant AF-AFOSR-0422-91)
(AD-A264755; AFOSR-93-0244TR) Avail: CASI HC A03/MF A01

AlGaP and GaP films were deposited on the (100) Si substrates by Atomic Layer Epitaxy (ALE) in the temperature range between 450 and 600 C. Under optimum growth conditions, the growth of GaP and AlGaP was observed to proceed in a two-dimensional (2-D) fashion in the initial growth stages. These ALE-grown films have better surface morphology when compared with the corresponding MOCVD-grown films. With an AlGaP buffer layer grown on Si, the subsequent growth of GaAs on the AlGaP-coated Si substrates tends to proceed 2-D growth. This avoids island growth and the two-step growth process currently used. DTIC

1,2-DIMETHYL-1,2-DISILA-CLOSO-DODECABORANE(12), A SILICON ANALOG OF AN ORTHO-CARBORANE: SYNTHESIS; X RAY CRYSTAL STRUCTURE; NMR, VIBRATIONAL AND PHOTOELECTRON SPECTRA; BONDING
Dietmar Seyferth, Klaus D. Buechner, William S. Rees, Jr., Lars Wesemann, and William M. Davis 20 Apr. 1993 42 p
(Contract N00014-90-J-1590)
(AD-A264709; TR-40-ONR) Avail: CASI HC A03/MF A01

The reaction of (CH3)2Si(NMe2)2 with B1OH14 Yields a polymer, B1OH12 (dot) Me2NSi(CH3)2NMe2(sub n), whose pyrolysis in a stream of ammonia gives hexagonal boron nitride containing a little silicon nitride. In contrast, CH3(H)Si(NMe2)2 reacts with B1OH14 to give 1,2-dimethyl-1,2-disila-closo- dodecaborane(12) (DMSB), an air-sensitive solid, the structure of whose 1:1 benzene solvate was determined by X-ray diffraction. This compound crystallizes in the space group P ccn (56) with a = 10.081(1) A, b = 10.666(8) A, c = 16.130(5) A, V = 1734(2) cu A, and Z = 4. The final R is equal to 0.044 and RW = 0.058. The H-1, C-13, Si-29, and B-11 NMR spectra and mass spectrum of DMSB are reported. Its vibrational spectrum (Raman, 5-3600 /cm; IR, 200-3600 /cm) was measured and compared with that of ortho-carborane. A study of its He(1) photoelectron spectrum led to the conclusion that DMSB is the most electron-rich cluster of type XYB1OH1O with two adjacent main group element centers known. DTIC

PHOTOINDUCED ELECTRON-HOLE CHARGE SEPARATION, INTRINSIC SELF-DOPING AND NOVEL DEVICE APPLICATIONS OF Q1D HETEROJUNCTION MATERIALS: MIXED-HALIDE MX SOLIDS

A. Saxena, X. Z. Huang, J. T. Gammel, A. R. Bishop, and L. A. Worl
Mar. 1993 10 p
(AD-A264714) Avail: CASI HC A02/MF A01

We have extensively studied, both experimentally and theoretically, the following three mixed-halide systems: (1) PtCl(x)Br(1 - x); (2) PtCl(x)I(1 - x); and (3) PtBr(x)I(1 - x) for a variety of concentrations x. We have obtained direct spectroscopic evidence (vibrational modes) for charge separation from resonance raman (RR) experiments on doped and photoexcited single crystals of PtCl(x)Br(1 - x). In particular, electron polarons preferentially locate on the PtBr segment while hole polarons are trapped within PtCl segments. This polaron charge selectivity, which is potentially very useful for photovoltaic device applications, is demonstrated within theoretical calculations based on a discrete, 3/4-filled, two-band, tight-binding, extended Peierls-Hubbard model, showing strong hybridization of PtCl and PtBr electronic bands as the driving force for separation. In contrast to PtCl(x)Br(1 - x), we find that both the PtCl(x)I(1 - x) and the PtCl(x)Br(1 - x) systems exhibit qualitatively different behavior, such as intrinsic self doping. In other words, our simulations predict that electronic charge is spontaneously removed from the PtI segment and injected into the PtCl (or PtBr) segment, thus creating hole defects in PtI and electron defects (polarons/bipolarons) in PtCl (or PtBr). DTIC

RADIATION EFFECTS IN FCC METALS AND INTERMETALLIC COMPOUNDS: A MOLECULAR DYNAMICS COMPUTER SIMULATION STUDY

T. DiazdelaRubia, M. W. Guinan, and A. Caro (Paul Scherrer Inst., Villigen, Switzerland.) 16 Nov. 1992 35 p Presented at the Conference on Computer Simulations of Radiation Effects in Solids, Berlin, Germany, 23-28 Aug. 1992
(Contract W-7405-eng-48)
(DE93-009546; UCRL-JC-112059; CONF-9208146-2) Avail: CASI HC A03/MF A01

Recent results on atomic mixing, radiation-induced disordering, and defect production and clustering induced by displacement cascades in Cu, Ag, Cu3Au and Ni3Al are reviewed. Molecular dynamics computer simulation methods are employed with isotropic many body potentials and recoil energies near subcascade formation regime up the locally molten cascade core in the pure metals and intermetallics. Disordering of intermetallics takes place in the cascade core, but because of the short lifetime of the displacement cascade, chemical short range order is preserved in molten zone. Results reveal very large vacancy and interstitial type defect clusters at high recoil energy and cascade energy density. Vacancies agglomerate and collapse into Frank dislocation loops in quenching of the cascade molten core. Large interstitial clusters are directly produced in cascades and form prismatic dislocation loops. Fraction of defects in clusters for low temperature cascades increases with recoil energy and approaches approximately 70 and 60% for interstitials and vacancies, at recoil energies near threshold for subcascades. In the case of intermetallics the large energy required to produce and transport a superdislocation appears to inhibit interstitial prismatic loop punching and interstitials appear as isolated (100) dumbbells. ENERGY SPECTRA AND PHOTOELECTRON WORK FUNCTION FROM YBa2Cu3O7 HIGH-T(SUB c) SUPERCONDUCTOR [EHNERGETICHESKIE SPEKTRY I RABOTA VYKHODA FOTOEHIEKTRONOV IZ VTSP YBA2CU3O7]

I. M. Matora, A. A. Bogdzel, and V. V. Zhuravlev et al 1991 10 p In RUSSIAN
(DE93-606329; JINR-R-13-91-158) Avail: CASI HC A02/MF A01 (US Sales Only)

The results are presented of the experiments on the JINR newly built instrument for the photoelectron spectroscopy by the time-of-flight method. The energy resolution achieved was 0.2-0.05 eV. The electron work function (phi) from three samples of polycrystalline high-T(sub c) superconductor YBa2Cu3O7 were measured to be phi = 5.5 +/- 0.2 eV. Spectra of photoelectrons in dependence on time and energy are given. DOE

ELECTRONIC STATES IN QUANTUM WELLS WITH PERIODICALLY STRUCTURED INTERFACES

Sun Hong Aug. 1992 20 p
(DE93-606295; IC-92/191) Avail: CASI HC A03/MF A01 (US Sales Only)

The electronic energy subbands and minigaps in Lateral-Surface-Superlattices (LSSL's) produced by deposition of AlAs and GaAs fractional layers on (001) vicinal GaAs substrates were predicated by variational calculations. A coordinate transformation was introduced in the calculation which transforms the LSSL's with periodically structured interfaces to quantum wells with planar interfaces so that the boundary conditions of the electronic wave functions on the LSSL interfaces can be satisfied exactly. The calculations showed that our theory gives lower subband energies than those predicated by other variational calculations. The dependence of the energy minigaps between the first and second subbands on the LSSL structural parameters, such as the average widths of the LSSL's and the periods of their interface structures, was investigated. In the calculation, the barrier between GaAs and AlAs was assumed to be finite (=1.06eV) and infinite. The infinitely high potential barrier approximation (IHPBA) overestimates the energy minigap by 50% when the average width of the LSSL is 100A, and it reduces to 25% when the width is 200A. IHPBA does not work well when the average widths of the LSSL's are less than 200A. DOE

HARD PHOTON EMISSION FROM HIGH ENERGY ELECTRONS AND POSITRONS IN SINGLE CRYSTALS

V. N. Bajer, V. M. Katkov, and V. M. Strakhovenko 1991 31 p
(DE93-606328; IYaF-91-111) Avail: CASI HC A03/MF A01 (US Sales Only)

A radiation of electrons and positrons in single crystals in coherent bremsstrahlung (CBS) region was considered for the case when CBS has the most hard spectrum. Under this condition a particle moves near a crystalline plane (in fcc(d) crystal for axis (001) this is the plane (110)) and influence of the continuous plane potential should be taken into account. This potential gives additional contribution in soft part of the spectrum and affects on hard photon emission. Observation of this phenomena at high energy is discussed. DOE

SUPERCONDUCTING FILMS OF YBaCuO M.S. Thesis [FILMES SUPERCONDUTORES DO SISTEMA YBACUO]

A. L. Coelho 1991 59 p In PORTUGESE
(DE93-606831; INIS-BR-2987) Avail: CASI HC A04/MF A01 (US Sales Only)

Thick films of YBa2Cu3O(7-x) were prepared on alumina and YSZ (Yttria-stabilized zirconia) substrates by the screen printing technique. Several experimental conditions were studied, for instance: sintering time, temperature, thickness, and atmosphere annealed. The resulting films were characterized by x ray diffraction, AC electrical resistance, AC susceptibility, and scanning electron microscopy. The surface and cross-section were observed with an optical microscope. The x ray diffraction patterns were compared with a typical pattern and that has indicated the good quality of the samples. AC resistance and its temperature dependence were measured in the standard four-probe configuration. Films thickness was estimated in the scanning electron microscope. This technique was suitable for production of high T(sub c) superconducting films being a simple and inexpensive method. DOE

A. R. Alves 1991 104 p In PORTUGESE

(DE93-608739; INIS-BR-2992) Avail: CASI HC A06/MF A02 (US Sales Only)

The effects of magnetic fields applied parallel to the interface of an heterojunction n-AlGaAs/GaAs is studied. A qualitative analysis showed that this field modifies the Fermi surface of the two dimensional electron gas (2 DEG) confined on the heterojunction. It produces a strong asymmetry on the magnetoresistance of the 2 DEG relative to the two directions of the electric current. This interpretation is confirmed by a self-consistent numerical calculation involving a solution of the Schroedinger and Poisson equations. To verify this result, measurements with samples grown by Molecular Beam Epitaxy (MBE) under magnetic fields up to 13.0 T are performed and the results obtained confirm the asymmetry in the magnetoresistance. Also, a strong negative magnetoresistance attributed to the imperfections of the interface is seen. It can be used to evaluate the quality of the heterojunction interface. The details about the implantation of the photoluminescence measurement system are discussed. Spectra of an asymmetric quantum well and delta-doped GaAs:Si samples at 300 K and 55 K are shown. DOE

A TIGHT BINDING MODEL FOR THE ELECTRONIC STRUCTURE OF FCC AND SC C60

N. Tit and V. Kumar Jul. 1992 5 p

(DE93-606214; IC-92/168) Avail: CASI HC A01/MF A01 (US Sales Only)

Ab-initio calculations for K3C60 indicate that the general features of the energy bands within LDA remain nearly unchanged as compared to C60. In the electron-phonon pairing mechanism of superconductivity in these materials, the variation in T(sub c) has been attributed to changes in the lattice constant which affects N(E(sub F)). We have therefore, fitted the valence and conduction bands of the FCC C60, which were obtained by Troullier and Martins from an LDA plane wave basis calculations, with a tight binding model and studied the energy bands as a function of the lattice constant. As the overlap between orbitals on neighboring balls is small, the band width is found to decrease by about 30% in going from K3C60 to Rb2CsC60. The density of states, thus, obtained is used to estimate variation in T(sub c) from McMillian's formula. These results are in good agreement with experimental data. Calculations of the energy bands are also presented for the low temperature Pa3-bar structure. DOE

TENSILE STUDY OF SINGLE-CRYSTAL TERNARY L1(2) TRIALUMINIDE Al66Ti25Mn(SUB g) Final Report, 1 Sep. 1991 - 31 Jan. 1993

S. A. Brown and K. S. Kumar 2 Mar. 1993 43 p

(Contract F49620-91-C-0099)

(AD-A264297; MML-TR-93-01; AFOSR-93-0287TR) Avail: CASI HC A03/MF A01

Single crystal Al66Ti25Mn9 has been produced and tested in compression as well as uniaxial tension. Yield strengths in compression for orientations near (001) and (111) continuously decrease with increasing temperature in a manner similar to other single crystal L1(sub 2) trialuminides and also to polycrystals of these materials. Slip was determined to occur on the (111) octahedral planes using two-surface analysis. Critical resolved shear stress (CRSS) variation with temperature, calculated for the (111) zone axes (1'01) slip system, overlaps closely for both orientations. Dislocation analysis confirmed the Burgers vectors to be of the type a group of zone axes (110) at both 298 and 1073 K. A few uniaxial tension tests were conducted near zone axes (001) at 1073 K; the HIPed specimens contained a small amount of residual porosity and second phases, which resulted in elastic failure even at this high temperature. Efforts to produce additional crystals with even better microstructures for tension testing are underway. DTIC

ULTRAFAST, PASSIVE, BROAD-BAND, OPTICAL SHUTTER BASED ON NOVEL SEMICONDUCTOR/CONDUCTING POLYMER INTERFACES Final Report, 15 Jan. - 15 Dec. 1992

P. Chandrasekhar 18 Dec. 1992 9 p

(Contract F49620-92-C-0040)

(AD-A264098; AFOSR-93-0301TR) Avail: CASI HC A02/MF A01

The project is sought to implement new technology for a novel solid state optical shutter. The shutter was obtained by interfacing inorganic semiconductors to conducting polymers, which then switch on activation by a high intensity radiation source in the ultrafast regime. Se/P(DPA) interfaces were prepared and yielded switching efficiencies at 532 nm, calculated as Delta OD= OD(laser)-OD(rest), of between 0.3 and 0.6 at pulse energies as low as 0.1-1.0 mJ/pulse (7 mm beam). Tests with CdSe and AlSb yielded similar Delta OD values. Tests with single crystal CdSe did not yield promising results. The conclusion appears to be that much additional work is needed, especially on a scientific level probing the physical aspects of the phenomenon, before practical devices can become feasible. DTIC

GROWTH MODEL OF Au FILMS ON Ru(001)
E. Canessa and A. Calmetta Jun. 1992 13 p
(DE92-642126; IC-92/123) Avail: CASI HC A03/MF A01 (US Sales Only)

In an attempt to find generic features on the fractal growth of Au films deposited on Ru(001), a simple simulation model based on irreversible diffusion-limited aggregation (DLA) is discussed. Highly irregular two-dimensional dentritic islands of Au particles that gradually grow on a larger host lattice of Ru particles and have fractal dimension d(sub f) approximately 1.70 each, are generated via a multiple had-hoc version of the DLA algorithm for single aggregates. Annealing effects on the islands morphology are reproduced assuming different sticking probabilities at nearest-neighbor lattice sites of Au films on Ru(001). Using simulation data, islands growth are described in analogy to diffusion-limited, precipitate growth with soft impingement of precipities. This leads to analyze thin film island growth kinetics in such fractal systems and to predict a main peak in scattering intensity patterns due to interisland interference. DOE

ROLE OF OXYGEN VACANCIES IN ANODIC TiO2 THIN FILMS
N. Tit (Minnesota Univ., Minneapolis.) and J. W. Halley (Minnesota Univ., Minneapolis.) May 1992 15 p
(DE92-642137; IC-92/88) Avail: CASI HC A03/MF A01 (US Sales Only)

Defects play an important role in the electronic and optical properties of amorphous solids in general. Both experimental and theoretical investigations on the nature and origin of defect states in anodic rutile TiO2 thin films (of thickness 5nm to 20nm) were presented. There is experimental evidence that the observed gap state at 0.7eV below the edge of conduction-band is due to an oxygen vacancy. For this reason, oxygen vacancies are used in our model. A comparison of the calculated bulk-photoconductivity to photospectroscopy experiment reveals that the films have bulk-like transport properties. On the other hand a fit of the surface density of states to the scanning tunneling microscopy (STM) on the (001) surfaces has suggested a surface defect density of 5% of oxygen vacancies. To resolve this discrepancy, the dc-conductivity where localization effects are included was calculated. Our results show an impurity band formation at about p(sub c) = 9% of oxygen vacancies. It was concluded that the gap states seen in STM are localized and the oxygen vacancies are playing the role of trapping centers (deep levels) in the studied films. DOE

The semiclassical Einstein-Schroedinger equations describing the evolution of spacetime geometry and a massive scalar quantum field with arbitrary coupling to curvature are linearized around their de Sitter-Bunch-Davies solution. The renormalized energy momentum tensor expectation value is calculated in linear order for a spatially homogeneous deviation from the Sitter-Bunch-Davies system. The momentum integrations are executed analytically. The linearized backreaction problem is completely solved via Laplace transformation and the general solution is analyzed with respect to instabilities. There are only two potential instabilities: a constant mode which is just a pure gauge and an instability on the Planck time scale which lies outside of the scope of the study's semiclassical theory. TOPICS IN GENERAL RELATIVITY THEORY: GRAVITATIONAL-WAVE MEASUREMENTS OF BLACK-HOLE PARAMETERS; GRAVITATIONAL COLLAPSE OF A CYLINDRICAL BODY; AND CLASSICAL-PARTICLE EVOLUTION IN THE PRESENCE OF CLOSED, TIMELIKE CURVES Ph.D. Thesis
Fernando Echeverria 1993 95 p
Avail: Univ. Microfilms Order No. DA9307036

I study three different topics in general relativity. The first study investigates the accuracy with which the mass and angular momentum of a black hole can be determined by measurements of gravitational waves from the hole, using a gravitational-wave detector. The black hole is assumed to have been strongly perturbed and the detector measures the waves produced by its resulting vibration and ring-down. The uncertainties in the measured parameters arise from the noise present in the detector. It is found that the faster the hole rotates, the more accurate the measurements will be, with the uncertainty in the angular momentum decreasing rapidly with increasing rotation speed. The second study is an analysis of the gravitational collapse of an infinitely long, cylindrical dust shell, an idealization of more realistic, finite-length bodies. It is found that the collapse evolves into a naked singularity in finite time. Analytical expressions for the variables describing the collapse are found at late times, near the singularity. The collapse is also followed, with a numerical simulation, from the start until very close to the singularity. The singularity is found to be strong, in the sense that an observer riding on the shell will be infinitely stretched in one direction and infinitely compressed in another. The gravitational waves emitted from the collapse are also analyzed. The last study focuses on the consequences of the existence of closed time like curves in a worm hole space time. One might expect that such curves might cause a system with apparently well-posed initial conditions to have no self-consistent evolution. We study the case of a classical particle with a hard-sphere potential, focusing attention on initial conditions for which the evolution, if followed naively, is self-inconsistent: the ball travels to the past through the worm hole colliding with its younger self, preventing itself from entering the worm hole. We find, surprisingly, that for all such 'dangerous' initial conditions, there are an infinite number of self-consistent solutions. We also find that for many non-dangerous initial conditions, there also exist an infinity of possible evolutions. Author (revised)

PHOTODISSOCIATION OF HBr/LiF(001): A QUANTUM MECHANICAL MODEL
Tamar Seideman 1993 31 p
(Contract NCC2-737)
(NASA-CR-193119; NAS 1.26:193119) Avail: CASI HC A03/MF A01

The photodissociation dynamics of HBr adsorbed on a LiF(001) surface is studied using time-independent quantum mechanics. The photodissociation lineshape and the Br(P(sub 1/2)-2)/Br(P(sub 3/2)-2) yield ratio are computed and compared with the corresponding quantities for gas phase photodissociation. The angular distribution of the hydrogen photofragments following excitation of adsorbed HBr is computed and found to agree qualitatively with experimental data. The effect of polarization of the photon is illustrated and discussed. The field polarization is found to affect significantly the magnitude of the photodissociation signal but not the angular dependence of the photofragment distribution, in agreement with experiment and in accord with expectations for a strongly aligned adsorbed phase. Results for the single-particle density of states and the conductivity were obtained for both the attractive-and repulsive-U Hubbard models. At half-filling, the densities of states for both models are identical, but the gap for the attractive case arises from the formation of charge-density-wave and superconducting correlations, while for the repulsive-U Hubbard model the gap is the Mott-Hubbard gap and arises from the antiferromagnetic, Coulomb, correlations. Hubbard chains were studied by use of a generalization of Handscomb's quantum Monte Carlo scheme. Monte Carlo calculations of the two-particle vertex of the 2D repulsive-U Hubbard model were performed. Criteria for determining whether a system is insulating, metallic, or superconducting were investigated; it was found for lattice models (Hubbard, Holstein, etc.) that this is determined by the value of the current- function. Measurements leading to the calculation of the ideal-gas thermodynamic properties are reported for thianthrene and phenoxathiin. Experimental methods included combustion calorimetry, adiabatic heat-capacity calorimetry, vibrating-tube densitometry, comparative ebulliometry, inclined-piston gauge manometry, and differential-scanning calorimetry (d.s.c.). Critical properties were estimated for both materials based on the measurement results. Entropies, enthalpies, and Gibbs energies of formation were derived for the ideal gas for both compounds for selected temperatures between 298.15 K and 700 K. The property-measurement results reported here for thianthrene and phenoxathiin provide the first experimental gas-phase Gibbs energies of formation for tricyclic diheteroatom-containing molecules. Basic formulations, analyses, and numerical procedures are presented to investigate radiative heat interactions in diatomic and polyatomic gases under local and nonlocal thermodynamic equilibrium conditions. Essential governing equations are presented for both gray and nongray gases. Information is provided on absorption models, relaxation times, and transfer equations. Radiative flux equations are developed which are applicable under local and nonlocal thermodynamic equilibrium conditions. The problem is solved for fully developed laminar incompressible flows between two parallel plates under the boundary condition of a uniform surface heat flux. For specific applications, three diatomic and three polyatomic gases are considered. The results are obtained numerically by employing the method of variation of parameters. The results are compared under local and nonlocal thermodynamic equilibrium conditions at different temperature and pressure conditions. Both gray and nongray studies are conducted extensively for all molecular gases considered. The particular gases selected for this investigation are CO, NO, OH, CO2, H2O, and CH4. The temperature and pressure range considered are 300-2000 K and 0.1-10 atmosphere, respectively. In general, results demonstrate that the gray gas approximation overestimates the effect of radiative interaction for all conditions. The conditions of NLTE, however, result in underestimation of radiative interactions. The method developed for this study can be extended to solve complex problems of radiative heat transfer involving nonequilibrium phenomena. Author (revised)

BOREL SUM RULES FOR OCTET BARYONS IN NUCLEAR MEDIUM

Y. Kondo and O. Morimatsu Jun. 1992 13 p
(DE93-753245; INS-933) Avail: CASI HC A03/MF A01

Borel sum rules are examined for octet baryons in the nuclear medium. First, it is noticed that in the medium the dispersion relation is realized for the retarded correlation Pi(sup R)(omega, q(sup 2)) in the energy omega. Then, Pi(sup R)(omega, q(sup 2)) is split into even and odd parts of omega in order to apply the Borel transformation. The obtained Borel sum rules differ from those of previous works. The mass shifts of octet baryons are calculated in the leading order of the operator product expansion with linear density approximation for the condensates. It is found that both scalar and vector condensates of the quark field, (q-bar q) and (q(sup +)q), induce attraction to the octet baryons in the medium in contrast to the results of previous works. It is also found that absolute value of (delta)M(sub N) is greater than absolute value of (delta)M(sub Lambda) is greater than absolute value of (delta)M(sub Sigma) is approximately absolute value of (delta)M(sub Xi). The absolute values, however, turn out to be one order of magnitude larger than those empirically known if a Borel mass of around 1 GeV is used in the present approximation. DOE

THERMODYNAMIC PROPERTIES OF NATURAL GAS MIXTURES Annual Report, 1 Jan. 1989 - 31 Dec. 1989

J. C. Holste and K. R. Hall Nov. 1992 22 p
(Contract GRI-5087-260-1449; RF Proj. 5696)
(PB93-162816) Avail: CASI HC A03/MF A01

The objective of the project is to provide PVT and calorimetric data for fluids and fluid mixtures which are components of natural gas or synthetic gas. Data collected on a pycnometer and a Burnett are presented. These data range from 225-350 K and from 0-70 MPa and include densities and virial coefficients. The fluids covered are a ternary mixture of methane, ethane and carbon dioxide; a binary mixture of methane and ethane; and two constructed standard reference gasses representative of natural gas in the USA. The development and application of high accuracy thermodynamic data and models for the natural gas industry is important in a number of applications. As better in situ fluid sensing technology develops, greater need will arise for high quality thermodynamic data to allow real time monitoring of changes occurring to the fluid. The application of the data in the gas industry covers a broad range and includes natural gas custody transfer, gas production and processing, compressed natural gas vehicles to name a few. Comprehensive data sets of high quality thermodynamic data covering the ranges of pressure and temperature required to meet all of the gas industry's applications are very rare. NTIS

UNDERSTANDING CONFORMAL FIELD THEORY THROUGH PARAFERMIONS AND CHERN SIMONS THEORY Ph.D. Thesis

S. A. Hotes 19 Nov. 1992 56 p
(Contract DE-AC03-76SF-00098)
(DE93-010452; LBL-33186) Avail: CASI HC A04/MF A01

Conformal field theories comprise a vast class of exactly solvable two dimensional quantum field theories. Conformal theories with an enlarged symmetry group, the current algebra symmetry, are a key ingredient to possible string compactification models. The following work explores a Lagrangian approach to these theories. In the first part of this thesis, a large class of conformal theories, the so-called coset models, are derived semi-classically from a gauged version of the Wess-Zumino-Witten functional. A non-local field transformation to the parafermionic field description is employed in the quantization procedure. Classically, these parafermionic fields satisfy non-trivial Poisson brackets, providing insight into the fractional spin nature of the conformal theory. The W-algebra symmetry is shown to appear naturally in this approach. In the second part of this thesis, the connection between the fusion algebra structure of Wess-Zumino-Witten models and the quantization of the Chern-Simons action on the torus is made explicit. The modular properties of the conformal model are also derived in this context, giving a natural demonstration of the Verlinde conjecture. The effects of background gauge fields and monopoles are also discussed. DOE

THERMODYNAMIC AND STRUCTURAL PROPERTIES OF METALLIC GLASSES AND SUPERCOOLED LIQUIDS Ph.D. Thesis
Dewei Qi 1991 177 p
(ISBN-0-315-72443-9) Avail: Univ. Microfilms Order No. DANN72443

It is demonstrated, both theoretically and numerically, that the Gibbs-Bogoliubov (GB) thermodynamic variational calculations, developed originally for equilibrium systems, can be applied to a metastable thermodynamic system provided the structure of the chosen reference system has the same main features as the metastable system under consideration. It appears that the Einstein model, which properly contains the basic glass characteristics, can be used as a reference system for metallic glasses and that the hard sphere model, which properly includes the basic liquid properties, can be used as a reference system for supercooled metallic liquids. The results for the thermodynamic quantities, calculated for the glass states of Mg3Ca7 and Al and for the supercooled liquid states of Mg3Ca7, Ti66V34, In, and V are in a good agreement with those of computer and laboratory experiments. Also, the investigation of the GB variational calculations for the behavior of the heat capacity at constant pressure for supercooled liquid Rb suggests that supercooled liquids can be divided into two regions: the undercooled region and the hypercooled region, in which the structure of the liquids may differ. Next, in order to study the topological structure of supercooled liquids and glasses, molecular-dynamics simulations with a damped force method are performed to model the liquids and glasses in a sample of 150 Mg atoms and 350 Ca atoms. The techniques of pair analysis and steepest descent minimization with the conjugate gradient method are used to analyze the structural properties for the supercooled liquids and glasses. Not only are the usual Frank-Kasper polyhedra with coordination number 14-16 and Bernal 'hole' polyhedra with coordination number 10 detected, but also fourteen other kinds of defective icosahedra are identified. Especially, the number of the defective icosahedra defined by eight 1551 pairs, two 1661 pairs and two 1441 pairs is greater than that of Frank-Kasper or that of Bernal polyhedra, and is next to the number of icosahedra. On average, 61 percent of the atoms are in icosahedra and 32 percent atoms are in defective icosahedra at T = 100 K. The correlation between the energies and populations of the different kinds of pairs is explained. These results strongly support the physical picture of liquids and glasses being a disordered, entangled array of +72 deg and -72 deg disclination lines in an icosahedral medium. Further, it is proved that W(sub 6). is a standard gauge of icosahedral order for a variety of defective icosahedra. Dissert. Abstr.

QUANTUM FIELD THEORY IN SPACES WITH CLOSED TIME-LIKE CURVES
D. G. Boulware 1992 51 p
(Contract DE-FG06-91ER-40614)
(DE93-010564; DOE/ER-40614/19) Avail: CASI HC A04/MF A01

Gott spacetime has closed timelike curves, but no locally anomalous stress-energy. A complete orthonormal set of eigenfunctions of the wave operator is found in the special case of a spacetime in which the total deficit angle is 27(pi). A scalar quantum field theory is constructed using these eigenfunctions. The resultant interacting quantum field theory is not unitary because the field operators can create real, on-shell, particles in the acausal region. These particles propagate for finite proper time accumulating an arbitrary phase before being annihilated at the same spacetime point as that at which they were created. As a result, the effective potential within the acausal region is complex, and probability is not conserved. The stress tensor of the scalar field is evaluated in the neighborhood of the Cauchy horizon; in the case of a sufficiently small Compton wavelength of the field, the stress tensor is regular and cannot prevent the formation of the Cauchy horizon. QUANTUM GROUP AND SYMMETRY OF THE HEAT EQUATION
P. K. Jha (Delhi Univ., India.) and K. C. Tripathy Jul. 1992 9 p
(DE93-607560; IC-92/163) Avail: CASI HC A02/MF A01 (US Sales Only)

The symmetry associated with the heat equation is re-examined using Lie's method. Under suitable choice of the arbitrary parameters in the Lie field, it is shown that the system exhibits SL(2,R) symmetry. On inspection of the q-analog of the principal solution, broadening of the Gaussian-flow curve when q is varied from 1 to 0.002 is found. The q-analog of the general solution predicts the existence of additional degeneracy. DOE

GEOMETRICAL APPROACH TO THE DYNAMICS OF A RELATIVISTIC STRING IN THE D-DIMENSIONAL MINKOWSKI SPACE
B. M. Barbashov and N. R. Shvetz (Moscow State Univ., Russia.) 1991 15 p
(DE93-606071; JINR-E-2-91-7) Avail: CASI HC A03/MF A01 (US Sales Only)

A geometrical method is considered for solving the boundary-value problem in the theory of a relativistic string with point masses at the ends in the D-dimensional pseudo-Euclidean space. The string world-surface is restricted by two curves, the world trajectories of the point masses, and is described in terms of the quadratic differential forms and the torsion vectors. The case D = 4 is considered in detail where the equations of the boundaries of the string surface become the Frenet equations. The choice of the constant second and third curvatures of the world trajectories, the latter being equal to zero, determines the world sheet of a relativistic string to be a helicoid, when appropriate transformations of global coordinates are made. The same result has been obtained in a space with D less than 4, but this requires a further estimate of the torsion vectors at the boundaries. DOE

INTEGRALS OF MOTION ON THE GROUP OF INVARIANCE OF AN INTERVAL IN THREE-DIMENSIONAL SPACES [INTEGRALY DVIZHENIYA NA GRUPPE INVARIANTNOSTI INTERVALA TREKHMERNYKH PROSTRANSTV]
I. Lukac 1991 23 p In RUSSIAN
(DE93-606090; JINR-R-2-91-315) Avail: CASI HC A03/MF A01 (US Sales Only)

The six parametrical group of motion of three-dimensional spaces with arbitrary constant metric conserving the square of distance between two points (the group of invariance of an interval) is considered. The special attention is paid to the group of transformations of an arbitrary homogeneous three-dimensional quadric which is a subgroup of the group of invariance of an interval. The Riemann geometry of this group space is studied and its geometrical characteristics (metric, Riemann's and Ricci's tensors, curvature, etc.) are determined. The complete set of the integrals of motion on the group of invariance of an interval in three-dimensional spaces is found. The square of momentum, square of total angular momentum, helicity, and square of spin are induced in the set of observables. DOE

ELECTRIC MAGNETIC DUALITY IN STRING THEORY
A. Sen Jul. 1992 16 p
(DE93-606061; IC-92/171; TIFR-TH-92-41) Avail: CASI HC A03/MF A01 (US Sales Only)

The electric-magnetic duality transformation in four dimensional heterotic string theory discussed by Shapere, Trivedi, and Wilczek is shown to be an exact symmetry of the equations of motion of low energy effective field theory even after including the scalar and the vector fields, arising due to compactification, in the effective field theory. Using this duality transformation we construct rotating black hole solutions in the effective field theory carrying both electric and magnetic charges. The spectrum of extreme magnetically charged black holes turn out to be similar to that of electrically charged elementary string excitations lying on the leading Regge trajectory. We also discuss the possibility that the duality symmetry is an exact symmetry of the full string theory under which electrically charged elementary string excitations get exchanged with magnetically charged soliton like solutions. This proposal might be made concrete following the suggestion of Dabholkar et. al. that fundamental strings may be regarded as soliton like classical solutions in the effective field theory. DOE

THE GROUND STATE WAVEFUNCTIONS OF A CONFORMALLY INVARIANT SCALAR FIELD IN DIFFERENT SPACETIME BACKGROUND
Y. Anini Jul. 1992 17 p
(DE93-606063; IC-92/184) Avail: CASI HC A03/MF A01 (US Sales Only)

We carefully construct the ground state wavefunction of a conformally invariant scalar field as an Euclidean path integral over real field configurations that vanish at the past end point of Euclidean time. We consider two Euclidean spacetime backgrounds. The compact without boundary, i.e., a 4-sphere, and the asymptotically flat, i.e., a wormhole spacetime. Finally, we show that the analytic continuation of these states to the corresponding Lorentzian spacetime satisfy the time-dependent Schroedinger equation with proper choice of the pre-factor for the wavefunction. KNOT INVARIANTS AND CELLULAR AUTOMATA Final Technical Report, 1 Oct. 1990 - 30 Sep. 1991

David A. Meyer 4 May 1993 7 p

(Contract N00014-91-J-1512)

(AD-A264199) Avail: CASI HC A02/MF A01

The goal of this project was to build on an understanding of the connections between knot invariants, exactly solvable statistical mechanics models, and discrete dynamical systems toward an answer to the question of how early and robust thermodynamic behavior appears in lattice gas automata. Preliminary work focussed on developing an understanding of state models in knot theory and their relation to statistical mechanics models. Rather than considering the complicated and somewhat more difficult case of lattice gas hydrodynamics, the researcher began with a simpler model: a reversible cellular automaton in one dimension. This particular automaton has an additive conserved quantity which has been used to construct a one dimensional statistical mechanics model. He observes in simulations that the cellular automaton displays thermodynamic behavior which is well described by this one dimensional statistical mechanics model. In previous works it was shown that there is a naturally associated two dimensional statistical mechanics model as well, then examined the properties of this model, and suggested how these properties may relate to the behavior of the dynamical cellular automaton. INVARIANT STRUCTURES IN GAUGE THEORIES AND CONFINEMENT

L. V. Prokhorov (Leningrad State Univ., USSR.) and S. V. Shabanov 1991 20 p Submitted for publication

(DE92-644739; JINR-E-2-91-195) Avail: CASI HC A03/MF A01 (US Sales Only)

The problem of finding all gauge invariants is considered in connection with the problem of confinement. Polylocal gauge tensors are introduced and studied. It is shown (both in physical and pure geometrical approaches) that the path-ordered exponent is the only fundamental bilocal gauge tensor, which means that any irreducible polylocal gauge tensor is built of P-exponents and local tensors (matter fields). The simplest invariant structures in electrodynamics, chromodynamics, and a theory with the gauge group SU(2) are considered separately. DOE

REGULAR AND CHAOTIC MOTION OF TWO DIMENSIONAL ELECTRONS IN A STRONG MAGNETIC FIELD

Oded Bar-Lev and Shimon Levit May 1992 14 p

(DE93-604091; WIS-PH-92-45) Avail: CASI HC A03/MF A01 (US Sales Only)

For two dimensional system of electrons in a strong magnetic field, a standard approximation is the projection on a single Landau level. The resulting Hamiltonian is commonly treated semiclassically. An important element in applying the semiclassical approximation is the integrability of the corresponding classical system. We discuss the relevant integrability conditions and give a simple example of non-integrable system-two interacting electrons in the presence of two impurities-which exhibits a coexistence of regular and chaotic classical motions. Since the inverse of the magnetic field plays the role of the Planck constant in these problems, one has the opportunity to control the 'closeness' of chaotic physical systems to the classical limit. DOE

GENERAL METHOD FOR REDUCING THE TWO-BODY DIRAC EQUATION

A. P. Galeao and P. L. Ferreira 1992 27 p

(DE93-609833; IFT-P-004/92) Avail: CASI HC A03/MF A01 (US Sales Only)

A semirelativistic two-body Dirac equation with an enlarged set of phenomenological potentials, including Breit-type terms, is investigated for the general case of unequal masses. Solutions corresponding to definite total angular momentum and parity are shown to fall into two classes, each one being obtained by solving a system of four coupled first-order radial differential equations. The reduction of each of these systems to a pair of coupled Schroedinger-type equations is also discussed. DOE

A SQUEEZED STATE HOLOMORPHIC PHASE SPACE REPRESENTATION OF EQUATIONS OF MOTION

D. Galetti and J. S. Veiga Aug. 1992 21 p
(DE93-609835; IFT-P-031/92) Avail: CASI HC A03/MF A01 (US Sales Only)

A mapping scheme is presented which takes quantum operators associated to bosonic degrees of freedom into complex phase space integral kernel representatives. The procedure consists in using the Schroedinger equation sqeezed state as the starting point for the construction of the integral mapping kernel which, due to its inherent structure, is suited for the description of second quantized operators. Products and commutators of operators have their representatives explicitly written which reveal new details when compared to the usual q-p phase space description. The classical limit of the equations of motion for the canonical pair q-p is discussed in connection with the effect of sqeezing the quantum phase space cellular structure. DOE

RELATIVITY THEORY IN (2 + 2)-SPACE
V. N. Streltsov 1991 10 p
(DE92-644671; JINR-E-2-91-97) Avail: CASI HC A02/MF A01 (US Sales Only)

The formulation is discussed of relativity theory in noneuclidean space defined by the metric form d(tau)(sup 2) = dx(sup 1)dx(sup 2) + dx(sup 3)dx(sup 4). As is noted, in the particular case of (1+1) dimensions new variables x(sup 1) = t - z and x(sup 2) = t + z are quantities directly observed by the radar method which is used to define the concept of simultaneity and distance. The transition to them significantly simplifies (special) Lorentz transformations, the 'addition' theorem of velocities and so on. DOE

FORMULATION OF WAVE MECHANICS WITHOUT THE PLANCK CONSTANT h/2 PI
A. O. Barut Jul. 1992 4 p
(DE93-604083; IC-92/169) Avail: CASI HC A01/MF A01 (US Sales Only)

Quantum mechanics can be formulated without the parameters (h/2(pi)), m and e as a pure wave theory in terms of the frequencies alone. This is more directly related to experiments where one measures frequency differences rather than energies. Different quantum systems are then characterized by an intrinsic proper frequency omega(sub 0). DOE

N93-31003# International Centre for Theoretical Physics, Trieste (Italy).
THE GEOMETRY OF COMPLEX SPACE-TIMES WITH TORSION
G. Esposito May 1992 5 p
(DE92-641343; IC-92/80) Avail: CASI HC A01/MF A01 (US Sales Only)

The necessary and sufficient condition for the existence of alpha-surfaces in complex space-time manifolds with nonvanishing torsion is derived. For these manifolds, Lie brackets of vector fields with spinor Ricci identities contain explicitly the effects of torsion. This leads to an integrability condition for alpha-surfaces which does not involve just the self-dual Weyl spinor, as in complexified general relativity, but also the torsion spinor, in a nonlinear way, and its covariant derivative. A similar result also holds for four-dimensional, smooth real manifolds with a positive-definite metric. Interestingly, a particular solution of the integrability condition is given by right-flat and right-torsion-free space-times. DOE

THE 1992 TOWN MEETINGS: TOWARD A SHARED VISION
Apr. 1993 65 p
(NASA-NP-205; NAS 1.83:205) Avail: CASI HC A04/MF A01

With the goal of developing a shared vision for the future of NASA, the U.S. civil aeronautics and space agency conducted a series of town meetings across the country in Nov. and Dec. 1992. Specifically, NASA sought comment on the Agency's new vision statement and mission values, which were developed by the Agency's employees in an effort to redefine NASA's priorities and purpose for the 1990's and beyond. In practice, the meetings constituted a sort of nationwide brainstorming session on how to make aeronautics and space research more relevant to people's daily lives. Primary findings, NASA's action plan, town meeting proceedings, and conclusions are described. Derived from text

PROFILES OF MAJOR FEDERAL LITERACY PROGRAMS
N. Kober Jul. 1992 79 p
(PB93-163863) Avail: CASI HC A05/MF A01

The bulk of Federal funding for adult literacy, as well as the most significant Federal policy guidance, comes from a group of programs that have the following characteristics: have adult literacy or basic skills education as their sole purpose or as one of a limited number of primary purposes; explicitly authorize literacy or basic skills education as a primary means of achieving a related purpose, such as job training or American citizenship; or through Departmental directive, have taken on significant new literacy missions, such as the Head Start family literacy programs. The programs constitute the core of the Federal role in adult education. Together they provide a starting point for understanding the nature, themes, and breadth of the Federal contribution to adult literacy education. NTIS

PRODUCTIVITY MEASUREMENT IN SCIENCE AND TECHNOLOGY CONTRACTING Research Report, Aug. 1991 - Apr. 1992
Thomas W. Mahler, Jr. Apr. 1992 29 p
(AD-A262077; NDU-ICAF-92-S60) Avail: CASI HC A03/MF A01

This paper demonstrates the feasibility of using traditional productivity measurement techniques to analyze the productivity of Science and Technology (S and T) contracting offices. S and T contracting offices are usually associated with the research laboratories of the Armed Services. It is important that these offices operate efficiently because current national security strategy emphasizes research as the primary means of maintaining technological superiority. The author argues that simple, partial measures of productivity are the only practical tools for measuring the productivity of S and T contracting offices. The author develops a simple productivity measurement technique that is based-on similar techniques used in industry. The technique is then demonstrated using real world data from the Air Force's Wright Laboratory contracting office. DTIC

THE NASA SBIR PRODUCT CATALOG
J. A. Gilman (Futron Corp., Bethesda, MD.), J. B. Paige (Futron Corp., Bethesda, MD.), and F. Carl Schwenk (Futron Corp., Bethesda, MD.) Oct. 1992 99 p
(NASA-TM-108242; NAS 1.15:108242) Avail: CASI HC A05/MF A02

The purpose of this catalog is to assist small business firms in making the community aware of products emerging from their efforts in the Small Business Innovation Research (SBIR) program. It contains descriptions of some products that have advanced into Phase 3 and others that are identified as prospective products. Both lists of products in this catalog are based on information supplied by NASA SBIR contractors in responding to an invitation to be represented in this document. Generally, all products suggested by the small firms were included in order to meet the goals of information exchange for SBIR results. Of the 444 SBIR contractors NASA queried, 137 provided information on 219 products. The catalog presents the product information in the technology areas listed in the table of contents. Within each area, the products are listed in alphabetical order by product name and are given identifying numbers. Also included is an alphabetical listing of the companies that have products described. This listing cross-references the product list and provides information on the business activity of each firm. In addition, there are three indexes: one a list of firms by states, one that lists the products according to NASA Centers that managed the SBIR projects, and one that lists the products by the relevant Technical Topics utilized in NASA's annual program solicitation under which each SBIR project was selected.

NASA SBIR ABSTRACTS OF 1991 PHASE 1 PROJECTS
F. Carl Schwenk (Futron Corp., Bethesda, MD.), J. A. Gilman (Futron Corp., Bethesda, MD.), and J. B. Paige (Futron Corp., Bethesda, MD.) Sep. 1992 133 p
(NASA-TM-108240; SBIR-91-2; NAS 1.15:108240) Avail: CASI HC A07/MF A02

The objectives of 301 projects placed under contract by the Small Business Innovation Research (SBIR) program of the National Aeronautics and Space Administration (NASA) are described. These projects were selected competitively from among proposals submitted to NASA in response to the 1991 SBIR Program Solicitation. The basic document consists of edited, non-proprietary abstracts of the winning proposals submitted by small businesses. The abstracts are presented under the 15 technical topics within which Phase 1 proposals were solicited. Each project was assigned a sequential identifying number from 001 to 301, in order of its appearance in the body of the report. Appendixes to provide additional information about the SBIR program and permit cross-reference of the 1991 Phase 1 projects by company name, location by state, principal investigator, NASA Field Center responsible for management of each project, and NASA contract number are included. THE IDENTIFICATION OF EARLY WARNING SIGNALS PRIOR TO CONTRACTOR DEFAULT M.S. Thesis
Roch A. Switlik 17 Dec. 1992 101 p
(AD-A262828) Avail: CASI HC A06/MF A02

The purpose of this thesis was to investigate the contract administration process, during contract performance, prior to the point at which a termination for default (TFD) decision is made. The objective of this thesis was to determine if there are systemic indicators that may provide early warning signals to contract administrators, during performance of the contract, that the contractor may fail in complying with the contractual obligations, thus being TFD. This research was limited to Fixed-Price Supply-type contracts. The data for this research were obtained through literature research, telephone interviews, and survey questionnaires conducted with various Defense Logistics Agency organizations. This thesis concluded by providing a Performance Indicator Management Model, developed by the researcher, based upon the data obtained from this research. This model focuses on the major areas of contract performance, monitored by contract administrators and provides the most effective indicators, which provide advance warning of contractor difficulty that may lead to default. A PERSPECTIVE ON ACQUISITION OF NASA SPACE SYSTEMS Final Report, Oct. 1991 - Dec. 1992
J. R. Nelson, Karen W. Tyson, and Daniel M. Utech Dec. 1992 82 p
(AD-A263246; IDA-D-1224; IDA/HQ-92-42612) Avail: CASI HC A05/MF A01

The purpose of the work documented in this annotated briefing was for IDA to understand NASA's unique acquisition process (as opposed to DoD's), develop preliminary outcomes for space-related programs in terms of cost and schedule growth, and explore issues related to improving methods for estimating costs and schedules of space acquisition programs. IDA's initial findings concerning cost and schedule outcomes for NASA programs over the past thirty years show that manned programs generally show more cost growth then unmanned programs and high schedule growth is associated with high cost growth. Overall, NASA space programs have demonstrated enormous technical success; however, these successes take considerably more time and money than comparable DoD programs. DTIC

DEFENSE CONVERSION: REDIRECTING RESEARCH AND DEVELOPMENT
May 1993 244 p Original contains color illustrations
(OTA-ITE-552; ISBN-0-16-041779-1) Avail: CASI HC A11/MF A03; SOD HC

Defense conversion means finding productive civilian uses for the resources and people formerly devoted to the Nation's defense. Channeling the savings from reduced defense R&D to civilian R&D is, of course, only one option for using the peace dividend. There are many others, including deficit reduction. This Report examines opportunities to advance civilian technologies and improve U.S. industrial competitiveness internationally by redirecting research and development from defense to dual-use or civilian purposes. The Report has two parts. Part One analyzes how R&D institutions currently pursuing defense missions could be more responsive and useful to civilian technology development. Part Two of the Report examines how proposals for new national missions might replace defense in contributing to the country's repository of technology, high-value-added jobs, and gross domestic product. MANAGING OPERATIONAL INTELLIGENCE OVERLOAD: GUIDELINES FOR AVOIDING DECISION PARALYSIS Final Report, 15 Nov. 1992 - 2 Feb. 1993
Wendy L. Lichtenstein 18 Jun. 1993 32 p
(AD-A264184) Avail: CASI HC A03/MF A01

This paper presents guidelines to help the operational commander reduce the risk of intelligence overload which can cause delays in making decisions. A brief review of history shows that technological advancements have increased the reliability and usefulness of intelligence. But technology has not replaced the human factor in intelligence work and command. In fact, technology is not a panacea. Instead, developments may actually contribute to intelligence overload. Additionally, certain factors in today's military planning and execution environment increase the risk of overload. Therefore, practical, management-oriented guidelines are presented which highlight the human factor and emphasize command, not dependence on technology. DTIC

HOW TO COMPETE FOR NASA CONTRACTS
Aug. 1989 50 p Original contains color illustrations
(NASA-TM-109238; NAS 1.15:109238) Avail: CASI HC A03/MF A01; 1 functional color page

Various studies and NASA experience have found that business concerns can provide a vital and significant impetus to technological innovation, not only in the fields of space and aeronautics, but also in national technological growth. NASA personnel are determined to foster the development of small business capabilities in technical areas that will support future projects and establish a small business base for the development and production of flight hardware for future missions. The solicitation process for Federal contracts has grown quite complex over the years. Where possible, we continue to try to simplify and streamline procedures for obtaining and performing these contracts. This booklet is designed to help understand NASA solicitations, find the information needed in deciding whether to respond, and improve chances for success. The first section of this booklet will answer general questions concerning the various types of NASA solicitations. Your specific questions on how to prepare bids will be answered in the second section, which is followed by a third section on the unique features of construction contracting. A fourth section describes how to submit technical and cost proposals for the negotiated procurement process. Some tips or suggestions, called DO's and DONT's, are placed at the end of the second, third, and fourth sections. Then, in the fifth section, ways to seek business as a subcontractor are identified. PROCEEDINGS OF THE MEETING OF THE INTERGOVERNMENTAL US-RUSSIAN BUSINESS DEVELOPMENT COMMITTEE'S STANDARDS WORKING GROUP
S. I. Warshaw Apr. 1993 303 p Conference held in Gaithersburg, MD, 23-24 Mar. 1993
(PB93-179968; NISTIR-5166) Avail: CASI HC A14/MF A03

The 1992 U.S.-Russia Summit in Washington DC, marked the beginning of a new commercial relationship between the United States and Russia.

Additionally, the U.S. Secretary of Commerce and the Russian Minister of Foreign Economic Relations established an 'Intergovernmental U.S.-Russian Business Development Committee' to solve problems, promote trade development activities, and serve as the forum to assist in such trade related matters as standardization and conformity assessment matters. The Standards Working Group of the Committee held its first meeting in St. Petersburg, Russia, 8-9 Sep. 1992. The recommendations resulting from that first meeting are appended to the report. The second meeting of the Standards Working Group resulted in an exchange of information regarding the standards and conformity assessment practices of each country and an understanding of new standards related legislative initiatives within Russia. Of particular significance was the signing of a formal Memorandum of Understanding for cooperation on standards, certification, testing, and metrology matters between the United States (NIST) and Russia (GOSSTANDART). It was also the first public announcement of a new United States Department of Commerce initiative to provide financial support to Russians desiring to learn more about U.S. standardization practices within industrial and commercial enterprises. THE META MODEL HIERARCHY: A FRAMEWORK FOR INFORMATION SYSTEMS CONCEPTS AND TECHNIQUES

J. L. H. Oei, L. J. G. T. vanHemmen, E. D. Falkenberg, and S. Brinkkemper (Universiteit Twente, Enschede, Netherlands.) Jul. 1992 31 p Sponsored in part by Netherlands Organization for Scientific Research

(TR-92-17; ETN-93-93871) Avail: CASI HC A03/MF A01

The challenge of putting order into the chaos of modeling techniques on a formal basis is presented. The numerous information systems design methods and specification techniques being proposed can be compared on the basis of different criteria. A framework for ordering information systems modeling techniques based on meta models is proposed. This framework, called the meta model hierarchy, positions each technique according to an analysis of the distinctions between the basic concepts, and the set of constraints defined on these concepts. Relations between meta models are distinguished: partitioning, restriction, and degeneration. Each modeling technique is then positioned in the meta model hierarchy according to these order relations. The positioning of entity relationship modeling, NIAM, and Petri netsin the meta model hierarchy is discussed as an illustration of the use of the approach. ESA

A MODEL FOR PROCESSING THE SGML DOCUMENT IN VERSION ORIENTED HYPERTEXT SYSTEMS Ph.D. Thesis [ENTWURF EINES MODELLS DER VERARBEITUNG VON SGML-DOKUMENTEN IN VERSIONSORIENTIERTEN HYPERTEXT-SYSTEMEN DAS HYPERSGML-KONZEPT]

Hans-Walter Latz 1992 319 p In GERMAN

(ETN-93-93797) Avail: CASI HC A14/MF A03

The Hyper SGML concept, which combines the document model of hypertext and document architecture of SGML (Standard Generalized Markup Language) is presented. A general model for version conducting is discussed: the hypernet model allows the hypertext structure of HyperSGML documents to be defined and modules to be simultaneously used in several documents. Some characteristics of document processing with hypertext are given as examples: linear documents in macroliterary hypertext systems, coding of SGML documents and information losses by mixing, division, deletion, and compensation. The Hypertext Abstract Machine (HAM), a general data base system, and an interface in a distributed hypertext application which supplies basic objects such as modes, links, graphs, and attributes, is described. Some aspects of the unifying framework for version control in a computer aided design environment are depicted. ESA

PREPROCESSING REMOTELY-SENSED DATA FOR EFFICIENT ANALYSIS AND CLASSIFICATION

P. M. Kelly and J. M. White 1993 8 p Presented at the Automatic Object Recognition 3, Society of Photo-Optical Instrumentation Engineers (SPIE) OE/Aerospace Science 8 Sensing Meeting, Orlando, FL, 11-16 Apr. 1993
(Contract W-7405-eng-36)
(DE93-007367; LA-UR-93-301; CONF-930445-2) Avail: CASI HC A02/MF A01

Interpreting remotely-sensed data typically requires expensive, specialized computing machinery capable of storing and manipulating large amounts of data quickly. In this paper, we present a method for accurately analyzing and categorizing remotely-sensed data on much smaller, less expensive platforms. Data size is reduced in such a way an efficient, interactive method of data classification. DOE

SECURITY CLASSIFICATION OF INFORMATION
A. S. Quist Apr. 1993 214 p
(Contract DE-AC05-84OT-21400)
(DE93-012416; K/CG-1077/V2) Avail: CASI HC A10/MF A03

This document is the second of a planned four-volume work that comprehensively discusses the security classification of information. The main focus of volume 2 is on the principles for classification of information. Included herein are descriptions of the two major types of information that governments classify for national security reasons (subjective and objective information), guidance to use when determining whether information under consideration for classification is controlled by the government (a necessary requirement for classification to be effective), information disclosure risks and benefits (the benefits and costs of classification), standards to use when balancing information disclosure risks and benefits, guidance for assigning classification levels (Top Secret, Secret, or Confidential) to classified information, guidance for determining how long information should be classified (classification duration), classification of associations of information, classification of compilations of information, and principles for declassifying and downgrading information. Rules or principles of certain areas of our legal system (e.g., trade secret law) are sometimes mentioned to provide added support to some of those classification principles. DOE

A DISTRIBUTED OBJECT-ORIENTED DATABASE APPLICATION DESIGN M.S. Thesis
Hsin-Feng Wu Mar. 1993 217 p
(AD-A262591; AFIT/GCS/ENG/93M-06) Avail: CASI HC A10/MF A03

The purpose of this study is to analyze and develop a distributed object-oriented database management system (DOODBMS) application to support parallel software development of the Parallel Algorithms and Applications Group (PAAG) at AFIT. By following the software lifecycle of object-oriented paradigm, this thesis investigation is intended to generate requirements analysis, design, implementation, user interface design and implementation, and integration of the database application with the user interface. ITASCA, an existing DOODBMS platform, has been chosen to prototype the application for its distribution functionalities and object-oriented modeling power. The user interface of the database application is based on x-window OSF/Motif front-end system for its efficiency. Various operations of this distributed database include: retrieving information in the database, modifying data at the local site, looking up information of publications of libraries, etc. The user may access each local computer through graphical user interface without knowing the query language constructs of the DOODBMS platform. NASA/DOD AEROSPACE KNOWLEDGE DIFFUSION RESEARCH PROJECT. PAPER 28: THE TECHNICAL COMMUNICATION PRACTICES OF RUSSIAN AND US AEROSPACE ENGINEERS AND SCIENTISTS
Thomas E. Pinelli, Rebecca O. Barclay (Rensselaer Polytechnic Inst., Troy, NY.), Michael L. Keene (Tennessee Univ., Knoxville.), Madelyn Flammia (University of Central Florida, Orlando.), and John M. Kennedy (Indiana Univ., Bloomington.) 1993 11 p Repr. from IEEE Transactions on Professional Communication, v. 36, no. 2, Jun. 1993 p 95-104
(NASA-TM-108249; NAS 1.15:108249) Copyright Avail: CASI HC A03/MF A01

As part of Phase 4 of the NASA/DoD Aerospace Knowledge Diffusion Research Project, two studies were conducted that investigated the technical communication practices of Russian and U.S. aerospace engineers and scientists. Both studies had the same five objectives: first, to solicit the opinions of aerospace engineers and scientists regarding the importance of technical communication to their professions; second, to determine the use and production of technical communication by aerospace engineers and scientists; third, to seek their views about the appropriate content of the undergraduate course in technical communication; fourth, to determine aerospace engineers' and scientists' use of libraries, technical information centers, and on-line databases; and fifth, to determine the use and importance of computer and information technology to them. A self administered questionnaire was distributed to Russian aerospace engineers and scientists at the Central Aero-Hydrodynamic Institute (TsAGI) and to their U.S. counterparts at the NASA Ames Research Center and the NASA Langley Research Center. The completion rates for the Russian and U.S. surveys were 64 and 61 percent, respectively. Responses of the Russian and U.S. participants to selected questions are presented in this paper. Author

To further explore the concept of a collaboratory as it was first articulated and discussed in 1989 (Towards a National Collaboratory, 1989), the Computer Science and Telecommunications Board of the National Research Council convened a committee in December 1991 to study the need for and benefits of collaboration in scientific research, factors determining the effectiveness of collaboration, and the ability of information technology--specifically of electronically integrated collaboratories--to support and enhance interactive scientific research. In addressing these issues, the committee focused on three discrete areas of scientific investigation--oceanography, in which the difficulty and expense of gathering data and the interdependence of modelers and experimentalists provide motivation for greater collaboration (Chapter 2); space physics, which has of necessity used extensive computational technology in the analysis of data collected by cooperatively fielded space- and ground-based instruments (Chapter 3); and gene mapping and sequencing research that has led to construction of and reliance on massive databases (Chapter 4). Research in these fields is sponsored by a variety of agencies, including the National Science Foundation, the National Institutes of Health, the National Aeronautics and Space Administration, the (Defense) Advanced Research Projects Agency, the Office of Naval Research, and the Department of Energy. The committee's investigations suggested technical requirements and social and practical issues (Chapter 5) that must be considered and dealt with as part of the process of initiating a national collaboratory program (Chapter 6) in support of scientific research. NSSDC DATA LISTING
Richard Horowitz and Joseph H. King Apr. 1993 150 p
(NASA-TM-108264; NSSDC/WDC-A-R/S-93-18; NAS 1.15:108264) Avail: CASI HC A07/MF A02

This document identifies, in a highly summarized way, all the data held at the NSSDC. These data cover astrophysics and astronomy, solar and space physics, planetary and lunar, and Earth science disciplines. They are primarily, but not exclusively, from past and ongoing NASA spaceflight missions. We first identify all the data electronically available through NSSDC's principal online (magnetic disk-based) and nearline (robotics jukebox-based) systems, and then those data available on CDROM's. Finally, we identify all NSSDC-held data, the majority of which are still offline on magnetic tape, film, etc., but including the electronically accessible and CD-ROM resident data of earlier sections. These comprehensive identifications are in the form of two listings, one for the majority of NSSDC-held data sets resulting from individual instruments flown on individual spacecraft, and the other listing for the remainder of NSSDC-held data sets which do not adhere to this spacecraft/experiment/dataset hierarchy. The latter listing is presented in two parts, one for the numerous source catalogs of the NSSDC-operated Astronomical Data Center, and the other for the remainder. Access paths to all these data, and to further information about each, are also given in the related sections of this Data Listing. Note that this document is a companion to the electronically accessible information files (in particular, the NASA Master Directory) at NSSDC which also identify NSSDC-resident (and other) data. AN INVESTIGATION OF STEREOLITHOGRAPHY AS A MEANS OF PROTOTYPING FROM A CAD DATABASE
D. Hidson Jun. 1992 23 p
(AD-A263410; DREO-TN-92-25) Avail: CASI HC A03/MF A01

The Stereolithography (SLA) process was investigated to test its efficacy in producing three-dimensional parts from a Unigraphics CAD file. The method uses a photosensitive resin that is cured by means of a laser beam. The laser is directed to follow the CAD file and a model is built up with successive layers of resin between 0.127 and 0.508 mm (0.005 and 0.020 inch). Once the model is constructed, it is bathed in ultraviolet light for a postcuring process. It was found that the model undergoes various amounts of contraction and expansion, distorting its shape. A quantitative assessment of this is given. The process is very useful in producing a three-dimensional model from the CAD file, but the dimensional integrity is not sufficient for producing accurately dimensioned prototypes. DTIC

APPLIED INFORMATION SYSTEMS RESEARCH PROGRAM WORKSHOP
24 Jul. 1991 166 p Workshop held in Boulder, CO, 22-24 Jul. 1991
(NASA-TM-108773; NAS 1.15:108773) Avail: CASI HC A08

The first Applied Information Systems Research Program (AISRP) Workshop provided the impetus for several groups involved in information systems to review current activities. The objectives of the workshop included: (1) to provide an open forum for interaction and discussion of information systems; (2) to promote understanding by initiating a dialogue with the intended benefactors of the program, the scientific user community, and discuss options for improving their support; (3) create an advocacy in having science users and investigators of the program meet together and establish the basis for direction and growth; and (4) support the future of the program by building collaborations and interaction to encourage an investigator working group approach for conducting the program. For individual titles, see N93-29223 through N93-29241.

VIEWCACHE: AN INCREMENTAL DATABASE ACCESS METHOD FOR AUTONOMOUS INTEROPERABLE DATABASES
Nick Roussopoulos and Timoleon Sellis *In* NASA. Washington, Applied Information Systems Research Program Workshop 24 Jul. 1991 6 p (For primary document see N93-29222 11-82)
Avail: CASI HC A02

The objective is to illustrate the concept of incremental access to distributed databases. An experimental database management system, ADMS, which has been developed at the University of Maryland, in College Park, uses VIEWCACHE, a database access method based on incremental search. VIEWCACHE is a pointer-based access method that provides a uniform interface for accessing distributed databases and catalogues. The compactness of the pointer structures formed during cross-referencing with no actual data movement between database sizes. Once the search is complete, the set of collected pointers pointing to the desired data are dereferenced. CASI

IMPLEMENTING ERROR-VALUED SEMANTICS FOR DATAFLOW LANGUAGES ON IMPERATIVE MACHINES
P. J. Miller 27 Aug. 1992 21 p Presented at the Working Conference on Architectures and Compilation Techniques for Fine and Medium Grain Parallelism, Orlando, FL, 20-22 Jan. 1993
(Contract W-7405-eng-48)
(DE93-009319; UCRL-JC-111550; CONF-930129-2) Avail: CASI HC A03/MF A01

Exception handling as presented by Goodenough and Liskov is based on the semantics of control flow. Dataflow languages, on the other hand, use value-oriented semantics to handle errors. Error values created by one operation flow to other operations. A naive implementation of these test-and-propagate semantics can be very slow. Here, we present a code space partitioning model for implementing error values on imperative architectures. Computation begins in a fast, error free partition. If errors do occur, then the computation moves to a slower, safer, test-and-propagate partition. The technique combines the speed of the error-detect model with the safety of the test-and-propagate model. If no errors occur, then the computation completes as fast as it would in error-detect only code. A prototype compiler for TMSAL (a powerful subset of SISAL) programs demonstrates the usefulness of the technique. DOE

SELECTION AND TRANSMISSION OF INFORMATION. ISSUE 22: REPUBLIC INTERDEPARTMENTAL COLLECTION (SELECTED ARTICLES)
18 Mar. 1993 31 p Transl. into ENGLISH from Otbor i Peredacha Informatsii (Russia), no. 22, 22-33, 105 1969 p 1, 22-22, 105
(AD-A262825; FASTC-ID(RS)T-0962-92) Avail: CASI HC A03/MF A01

Analysis is given of representation of correlation functions of random processes and the processes themselves in the form of linear combinations of specific determined functions of time with random coefficients: general spectral, canonical, and orthogonal. It is shown that in contrast to the case of the commutative converters, analyzed in the terms of theory of C*-algebras and their Gelfand isomorphism, in the case of noncommutative converters, it is necessary to use operators of transformation of coordinates, composition of Volterra, and A-composition. The concept of T-representability, which generalizes the concept of harmonizability, is introduced. The examples examined are harmonic modulated oscillation/vibration, the periodically correlated processes, and sampling theorems. The problems of the linear theory of signal are solved within the framework of the covariance theory random process, which are represented in the form of the linear combination of the determined functions of time with the random coefficients. INFORMATION TECHNOLOGY: A FORCE FOR ORGANIZATIONAL CHANGE
William R. Bowen Apr. 1992 30 p
(AD-A261986; NDU-ICAF-92-S10) Avail: CASI HC A03/MF A01

Information Technology is changing the face of the world as we know it. Business use of technologies like Decision Support Systems and Electronic Data Interchange allow organizations to re-engineer their processes to eliminate unnecessary layers of management. New emerging technologies under the umbrella of Artificial Intelligence are helping us to replace the human being with computer technology that simulates expert advice or learns as it matures. To take advantage of these new technologies requires new organization structures and new ways of approaching problem solving. These new technologies are explored and related to organizational change. COLLECTION-ORIENTED MATCH: SCALING UP THE DATA IN PRODUCTION SYSTEMS
Anurag Acharya and Milind Tambe Dec. 1992 38 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A262755; CMU/CS-92-218) Avail: CASI HC A03/MF A01

Match algorithms that are capable of handling large amounts of data, without giving up expressiveness are a key requirement for successful integration of relational database systems and powerful rule-based systems. Algorithms that have been used for database rule systems have usually been unable to support large and complex rule sets, while the algorithms that have been used for rule-based expert systems do not scale well with increasing amounts of data. Furthermore, these algorithms do not provide support for collection (or set) oriented production languages. A basic shift in the nature of match algorithms: from tuple-oriented to collection-oriented is proposed. A collection-oriented match algorithm matches each condition in a production with a collection of tuples and generates collection-oriented instantiations, i.e., instantiations that have collection of tuples corresponding to each condition in the production. This approach shows great promise for efficiently matching expressive productions against large amounts of data. In addition, it provides direct support for collection-oriented production languages. Increasing reliance on and investment in information technology and electronic networking systems presupposes that computing and information technology will play a major role in the diffusion of aerospace knowledge. Little is known, however, about actual information technology needs, uses, and problems within the aerospace knowledge diffusion process. The authors state that the potential contributions of information technology to increased productivity and competitiveness will be diminished unless empirically derived knowledge regarding the information-seeking behavior of the members of the social system - those who are producing, transferring, and using scientific and technical information - is incorporated into a new technology policy framework. Research into the use of information technology and electronic networks by U.S. aerospace engineers and scientists, collected as part of a research project designed to study aerospace knowledge diffusion, is presented in support of this assertion. NASA/DOD AEROSPACE KNOWLEDGE DIFFUSION RESEARCH PROJECT. PAPER 31: THE INFORMATION-SEEKING BEHAVIOR OF ENGINEERS

Thomas E. Pinelli, Ann P. Bishop (Illinois Univ., Urbana-Champaign.), Rebecca O. Barclay (Rensselaer Polytechnic Inst., Troy, NY.), and John M. Kennedy (Indiana Univ., Bloomington.) 1993 36 p Repr. from the Encyclopedia of Library and Information Science, v. 52, suppl. 15, 1993 p 167-201
(NASA-TM-109224; NAS 1.15:109224) Avail: CASI HC A03/MF A01

Engineers are an extraordinarily diverse group of professionals, but an attribute common to all engineers is their use of information. Engineering can be conceptualized as an information processing system that must deal with work-related uncertainty through patterns of technical communications. Throughout the process, data, information, and tacit knowledge are being acquired, produced, transferred, and utilized. While acknowledging that other models exist, we have chosen to view the information-seeking behavior of engineers within a conceptual framework of the engineer as an information processor. This article uses the chosen framework to discuss information-seeking behavior of engineers, reviewing selected literature and empirical studies from library and information science, management, communications, and sociology. The article concludes by proposing a research agenda designed to extend our current, limited knowledge of the way engineers process information. Derived from text

DESIGN OF A PIXEL CELL OPTIMIZED FOR A DATA PUSH ARCHITECTURE READOUT

E. L. Atlas, S. Shapiro (Stanford Univ., CA.), and D. Cords (Stanford Univ., CA.) Dec. 1992 14 p
(Contract DE-AC03-76SF-00515)
(DE93-011016; SLAC-TN-92-2) Avail: CASI HC A03/MF A01

A pixel cell has been designed which has been optimized for a data push architecture readout. It retains the features of preceding designs which allow time stamping, analog signal processing, XY address recording, ghost elimination and sparse data transmission. It eliminates a number of problems inherent in previous designs by use of sampled data techniques, destructive readout sampled data techniques, and current mode output drivers. This document examines the motivation for this new pixel and covers the theory of operation of the various blocks. A discussion of the tradeoffs affecting speed, power, device size, and radiation stability is included as well. DOE

THE FUTURE ROLE OF THE DIRECTOR OF INFORMATION MANAGEMENT (DOIM) ORGANIZATION WITHIN THE DOD CORPORATE INFORMATION MANAGEMENT INITIATIVE Study Project

Archie M. Franks 15 Apr. 1993 41 p
(AD-A264118) Avail: CASI HC A03/MF A01

The Director of Information Management (DOIM) organization has the mission, with its duties and responsibilities, to satisfy installation users information management requirements. The DOIM's ability to carry out the automation or information management systems portion of that mission is being diminished by ongoing DOD initiatives and other factors (i.e., budget reductions, DOD drawdown, and antiquated infrastructure). Initiatives such as Corporate Information Management (CIM), Defense Business Operations Fund (DBOF), and Defense Management Report Decisions (DMRD) are aimed at improving service quality and organizational effectiveness and efficiency. They share common features like 'business process improvement'; yet may implement unique actions like personnel reductions or eliminations. Each impacts in some way on the DOIM's ability to accomplish its Information Mission Area (IMA) mission, along with above identified factors that operate within the information management environment. This study examines the DOIM organization within the framework of the CIM initiative, looking at the major factors which decrease organizational effectiveness. It attempts to find opportunities where the DOIM organization can eliminate duplication of effort and focus on an accomplishable mission, within today's constrained resource levels. DTIC

GODDARD CONFERENCE ON MASS STORAGE SYSTEMS AND TECHNOLOGIES, VOLUME 1

Ben Kobler, ed. and P. C. Hariharan, ed. (ST Systems Corp., Lanham, MD.) 1993 333 p Conference held in Greenbelt, MD, 22-24 Sep. 1992
(NASA-CP-3198; NAS 1.55:3198) Avail: CASI HC A15/MF A03

Copies of nearly all of the technical papers and viewgraphs presented at the Goddard Conference on Mass Storage Systems and Technologies held in Sep. 1992 are included. The conference served as an informational exchange forum for topics primarily relating to the ingestion and management of massive amounts of data and the attendant problems (data ingestion rates now approach the order of terabytes per day). Discussion topics include the IEEE Mass Storage System Reference Model, data archiving standards, high-performance storage devices, magnetic and magneto-optic storage systems, magnetic and optical recording technologies, high-performance helical scan recording systems, and low end helical scan tape drives. Additional topics addressed the evolution of the identifiable unit for processing purposes as data ingestion rates increase dramatically, and the present state of the art in mass storage technology. For individual titles, see N93-30450 through N93-30480.

MASS STORAGE SYSTEM REFERENCE MODEL, VERSION 4
Sam Coleman, ed. and Steve Miller, ed. (SRI International Corp., La Jolla, CA.) *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 1-72 (For primary document see N93-30449 11-82)
Avail: CASI HC A04/MF A03

The high-level abstractions that underlie modern storage systems are identified. The information to generate the model was collected from major practitioners who have built and operated large storage facilities, and represents a distillation of the wisdom they have acquired over the years. The model provides a common terminology and set of concepts to allow existing systems to be examined and new systems to be discussed and built. It is intended that the model and the interfaces identified from it will allow and encourage vendors to develop mutually-compatible storage components that can be combined to form integrated storage systems and services. The reference model presents an abstract view of the concepts and organization of storage systems. From this abstraction will come the identification of the interfaces and modules that will be used in IEEE storage system standards. The model is not yet suitable as a standard; it does not contain implementation decisions, such as how abstract objects should be broken up into software modules or how software modules should be mapped to hosts; it does not give policy specifications, such as when files should be migrated; does not describe how the abstract objects should be used or connected; and does not refer to specific hardware components. In particular, it does not fully specify the interfaces. Author (revised)

OPTICAL MEDIA STANDARDS FOR INDUSTRY
Kenneth J. Hallam *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 73-76 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

Optical storage is a new and growing area of technology that can serve to meet some of the mass storage needs of the computer industry. Optical storage is characterized by information being stored and retrieved by means of diode lasers. When most people refer to optical storage, they mean rotating disk media, but there are 1 or 2 products that use lasers to read and write to tape. Optical media also usually means removable media. Because of its removability, there is a recognized need for standardization, both of the media and of the recording method. Industry standards can come about in one or more different ways. An industry supported body can sanction and publish a formal standard. A company may ship enough of a product that it so dominates an application or industry that it acquires 'standard' status without an official sanction. Such de facto standards are almost always copied by other companies with varying degrees of success. A governmental body can issue a rule or law that requires conformance to a standard. The standard may have been created by the government, or adopted from among many proposed by industry. These are often known as de jure standards. Standards are either open or proprietary. If approved by a government or sanctioning body, the standard is open. A de facto standard may be either open or proprietary. Optical media is too new to have de facto standards accepted by the marketplace yet. The proliferation of non-compatible media types in the last 5 years of optical market development have convinced many of the need for recognized media standards. Author (revised)

TECHNOLOGY FOR NATIONAL ASSET STORAGE SYSTEMS
Robert A. Coyne, Harry Hulen, and Richard Watson (Lawrence Livermore National Lab., CA.) *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 77-86 (For primary document see N93-30449 11-82)
Avail: CASI HC A02/MF A03

An industry-led collaborative project, called the National Storage Laboratory, was organized to investigate technology for storage systems that will be the future repositories for our national information assets. Industry participants are IBM Federal Systems Company, Ampex Recording Systems Corporation, General Atomics DISCOS Division, IBM ADSTAR, Maximum Strategy Corporation, Network Systems Corporation, and Zitel Corporation. Industry members of the collaborative project are funding their own participation. Lawrence Livermore National Laboratory through its National Energy Research Supercomputer Center (NERSC) will participate in the project as the operational site and the provider of applications. The expected result is an evaluation of a high performance storage architecture assembled from commercially available hardware and software, with some software enhancements to meet the project's goals. It is anticipated that the integrated testbed system will represent a significant advance in the technology for distributed storage systems capable of handling gigabyte class files at gigabit-per-second data rates. The National Storage Laboratory was officially launched on 27 May 1992. Author (revised)

THE VISIBLE HUMAN PROJECT OF THE NATIONAL LIBRARY OF MEDICINE: REMOTE ACCESS AND DISTRIBUTION OF A MULTI-GIGABYTE DATA SET
Michael J. Ackerman *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 87-88 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

As part of the 1986 Long-Range Plan for the National Library of Medicine (NLM), the Planning Panel on Medical Education wrote that NLM should '...thoroughly and systematically investigate the technical requirements for and feasibility of instituting a biomedical images library.' The panel noted the increasing use of images in clinical practice and biomedical research. An image library would complement NLM's existing bibliographic and factual database services and would ideally be available through the same computer networks as are these current NLM services. Early in 1989, NLM's Board of Regents convened an ad hoc planning panel to explore possible roles for the NLM in the area of electronic image libraries. In its report to the Board of Regents, the NLM Planning Panel on Electronic Image Libraries recommended that 'NLM should undertake a first project building a digital image library of volumetric data representing a complete, normal adult male and female. This Visible Human Project will include digitized photographic images for cryosectioning, digital images derived from computerized tomography, and digital magnetic resonance images of cadavers.' The technologies needed to support digital high resolution image libraries, including rapid development; and that NLM encourage investigator-initiated research into methods for representing and linking spatial and textual information, structural informatics. The first part of the Visible Human Project is the acquisition of cross-sectional CT and MRI digital images and cross-sectional cryosectional photographic images of a representative male and female cadaver at an average of one millimeter intervals. The corresponding cross-sections in each of the three modalities are to be registerable with one another. Author (revised)

DATA MANAGEMENT IN NOAA
William M. Callicott *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 89-98 (For primary document see N93-30449 11-82)
Avail: CASI HC A02/MF A03

The NOAA archives contain 150 terabytes of data in digital form, most of which are the high volume GOES satellite image data. There are 630 data bases containing 2,350 environmental variables. There are 375 million film records and 90 million paper records in addition to the digital data base. The current data accession rate is 10 percent per year and the number of users are increasing at a 10 percent annual rate. NOAA publishes 5,000 publications and distributes over one million copies to almost 41,000 paying customers. Each year, over six million records are key entered from manuscript documents and about 13,000 computer tapes and 40,000 satellite hardcopy images are entered into the archive. Early digital data were stored on punched cards and open reel computer tapes. In the late seventies, an advanced helical scan technology (AMPEX TBM) was implemented. Now, punched cards have disappeared, the TBM system was abandoned, most data stored on open reel tapes have been migrated to 3480 cartridges, many specialized data sets were distributed on CD ROM's, special archives are being copied to 12 inch optical WORM disks, 5 1/4 inch magneto-optical disks were employed for workstation applications, and 8 mm EXABYTE tapes are planned for major data collection programs. The rapid expansion of new data sets, some of which constitute large volumes of data, coupled with the need for vastly improved access

mechanisms, portability, and improved longevity are factors which will influence NOAA's future systems approaches for data management.

INTERIM REPORT ON LANDSAT NATIONAL ARCHIVE ACTIVITIES Abstract Only
John E. Boyd *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 99 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

The Department of the Interior (DOI) has the responsibility to preserve and to distribute most Landsat Thematic Mapper (TM) and Multispectral Scanner (MSS) data that have been acquired by the five Landsat satellites operational since July 1972. Data that are still covered by exclusive marketing rights, which were granted by the U.S. Government to the commercial Landsat operator, cannot be distributed by the DOI. As the designated national archive for Landsat data, the U.S. Geological Survey's EROS Data Center (EDC) has initiated two new programs to protect and make available any of the 625,000 MSS scenes currently archived and the 200,000 TM scenes to be archived at EDC by 1995. A specially configured system has begun converting Landsat MSS data from obsolete high density tapes (HDT's) to more dense digital cassette tapes. After transcription, continuous satellite swaths are (1) divided into standard scenes defined by a world reference system, (2) geographically located by latitude and longitude, and (3) assessed for overall quality. Digital browse images are created by subsampling the full-resolution swaths. Conversion of the TM HDT's will begin in the fourth quarter of 1992 and will be conducted concurrently with MSS conversion. Although the TM archive is three times larger than the entire MSS archive, conversion of data from both sensor systems and consolidation of the entire Landsat archive at EDC will be completed by the end of 1994. Some MSS HDT's have deteriorated, primarily as a result of hydrolysis of the pigment binder. Based on a small sample of the 11 terabytes of post-1978 MSS data and the 41 terabytes of TM data to be converted, it appears that to date, less than 2 percent of the data have been lost. The data loss occurs within small portions of some scenes; few scenes are lost entirely. Approximately 10,000 pre-1979 MSS HDT's have deteriorated to such an extent, as a result of hydrolysis, that the data cannot be recovered without special treatment of the tapes. An independent consulting division of a major tape manufacturer has analyzed affected tapes and is confident that restorative procedures can be applied to the HDT's to permit one pass to reproduce the data on another recording media. A system to distribute minimally processed Landsat data will be procured in 1992 and will be operational by mid-1994. Any TM or MSS data in the national archive that are not restricted by exclusive marketing rights will be reproduced directly from the archive media onto user specified computer-compatible media. TM data will be produced either at a raw level (radiometrically and geometrically uncorrected) or at an intermediate level (radiometrically corrected and geometrically indexed). MSS data will be produced to an intermediate level or to a fully corrected level (radiometrically corrected and geometrically transformed to an Oblique Mercator projection). The system will be capable of providing ordered scenes within 48 hours of receipt of order. Author (revised)

MR-CDF: MANAGING MULTI-RESOLUTION SCIENTIFIC DATA
Kenneth Salem (Maryland Univ., College Park.) *In its* Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 101-111 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

MR-CDF is a system for managing multi-resolution scientific data sets. It is an extension of the popular CDF (Common Data Format) system. MR-CDF provides a simple functional interface to client programs for storage and retrieval of data. Data is stored so that low resolution versions of the data can be provided quickly. Higher resolutions are also available, but not as quickly. By managing data with MR-CDF, an application can be relieved of the low-level details of data management, and can easily trade data resolution for improved access time. Author

HIGH-PERFORMANCE MASS STORAGE SYSTEM FOR WORKSTATIONS
T. Chiang, Y. Tang, L. Gupta, and S. Cooperman *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 113-117 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

Reduced Instruction Set Computer (RISC) workstations and Personnel Computers (PC) are very popular tools for office automation, command and control, scientific analysis, database management, and many other applications. However, when using Input/Output (I/O) intensive applications, the RISC workstations and PC's are often overburdened with the tasks of collecting, staging, storing, and distributing data. Also, by using standard high-performance peripherals and storage devices, the I/O function can still be a common bottleneck process. Therefore, the high-performance mass storage system, developed by Loral AeroSys' Independent Research and Development (IR&D) engineers, can offload a RISC workstation of I/O related functions and provide high-performance I/O functions and external interfaces. The high-performance mass storage system has the capabilities to ingest high-speed real-time data, perform signal or image processing, and stage, archive, and distribute the data. This mass storage system uses a hierarchical storage structure, thus reducing the total data storage cost, while maintaining high-I/O performance. The high-performance mass storage system is a network of low-cost parallel processors and storage devices. The nodes in the network have special I/O functions such as: SCSI controller, Ethernet controller, gateway controller, RS232 controller, IEEE488 controller, and digital/analog converter. The nodes are interconnected through high-speed direct memory access links to form a network. The topology of the network is easily reconfigurable to maximize system throughput for various applications. This high-performance mass storage system takes advantage of a 'busless' architecture for maximum expandability. The mass storage system consists of magnetic disks, a WORM optical disk jukebox, and an 8mm helical scan tape to form a hierarchical storage structure. Commonly used files are kept in the magnetic disk for fast retrieval. The optical disks are used as archive media, and the tapes are used as backup media. The storage system is managed by the IEEE mass storage reference model-based UniTree software package. UniTree software will keep track of all files in the system, will automatically migrate the lesser used files to archive media, and will stage the files when needed by the system. The user can access the files without knowledge of their physical location. The high-performance mass storage system developed by Loral AeroSys will significantly boost the system I/O performance and reduce the overall data storage cost. This storage system provides a highly flexible and cost-effective architecture for a variety of applications (e.g., realtime data acquisition with a signal and image processing requirement, long-term data archiving and distribution, and image analysis and enhancement). GE NETWORKED MASS STORAGE SOLUTIONS SUPPORTING IEEE NETWORK MASS STORAGE MODEL
Donald Herzog *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 119-121 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

The General Electric Government Communications Systems Department (GE/GCSD) has developed a near real time digital data storage and retrieval system that extends the capabilities currently available in today's marketplace. This system called DuraStore uses commercially available rotary tape drive technology with ANSI/IEEE standards for automated magnetic tape based data storage. It uses a nonproprietary approach to satisfy a wide range of data rates and storage capabilities requirements and is compliant with the IEEE Network Storage Model. Rotary tape drives, standard interfaces, application specific hardware/software, networked automated tape libraries, library administrator, write protection, volume/physical media linkages, and maximum resource utilization are addressed. Derived from text

HIGH-SPEED DATA DUPLICATION/DATA DISTRIBUTION: AN ADJUNCT TO THE MASS STORAGE EQUATION
Kevin Howard *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 123-133 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

The term 'mass storage' invokes the image of large on-site disk and tape farms which contain huge quantities of low- to medium-access data. Although the cost of such bulk storage is recognized, the cost of the bulk distribution of this data rarely is given much attention. Mass data distribution becomes an even more acute problem if the bulk data is part of a national or international system. If the bulk data distribution is to travel from one large data center to another large data center then fiber-optic cables or the use of satellite channels is feasible. However, if the distribution must be disseminated from a central site to a number of much smaller, and, perhaps varying sites, then cost prohibits the use of fiber-optic cable or satellite communication. Given these cost constraints much of the bulk distribution of data will continue to be disseminated via inexpensive magnetic tape using the various next day postal service options. For non-transmitted bulk data, our working hypotheses are that the desired duplication efficiency of the total bulk data should be established before selecting any particular data duplication system; and, that the data duplication algorithm should be determined before any bulk data duplication method is selected.

THE FUNDAMENTALS AND FUTURES OF REMOVABLE MASS STORAGE ALTERNATIVES
Linda Kempster *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 135-141 (For primary document see N93-30449 11-82)
Avail: CASI HC A02/MF A03

This article reflects my view of how the storage products have been introduced into the marketplace, where they came from, and where others will continue to come from in the future. My corporate goal is to be a resource for those searching for removable solutions to mass storage problems. My introduction to optical storage occurred a few months before signing a non-disclosure agreement with FileNet on 8 Aug. 1983. By 87 or 88, as the optical craze was getting more popular, I started looking for similar or complementary storage technologies. I am still looking and my research is constantly turning up new entrants into this field. Due to the scope of the coverage in this field, this article does not dwell on any single technology. The goal is to provide information that is not compiled in any other single source and focus on facts that are not commonly known. I have provided a few baseline assumptions to ensure the mathematical calculations remain consistent: (1) hard-copy 8.5 in x 11 in documents which are scanned at 200 dots per inch (dpi) and compressed at a ratio of 10:1 result in a document image which requires an average of 50 Kilobytes (KB) of storage; (2) an average ASCII page requires 2 KB of storage; (3) an average file cabinet drawer can hold 2500 pieces of paper; (4) one GB of storage can hold an average of 20,000 document images (a reel of 6250 tape holds 180 Megabytes (MB)). THE NT DIGITAL MICRO TAPE RECORDER c35
Toshikazu Sasaki, John Alstad, and Mike Younker *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 143-157 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

The description of an audio recorder may at first glance seem out of place in a conference which has been dedicated to the discussion of the technology and requirements of mass data storage. However, there are several advanced features of the NT system which will be of interest to the mass storage technologist. Moreover, there are a sufficient number of data storage formats in current use which have evolved from their audio counterparts to recommend a close attention to major innovative introductions of audio storage formats. While the existing analog micro-cassette recorder has been (and will continue to be) adequate for various uses, there are significant benefits to be gained through the application of digital technology. The elimination of background tape hiss and the availability of two relatively wide band channels (for stereo recording), for example, would greatly enhance listenability and speech intelligibility. And with the use of advanced high-density recording and LSI circuit technologies, a digital micro recorder can realize unprecedented compactness with excellent energy efficiency. This is what was accomplished with the NT-1 Digital Micro Recorder. Its remarkably compact size contributes to its portability. The high-density NT format enables up to two hours of low-noise digital stereo recording on a cassette the size of a postage stamp. Its highly energy-efficient mechanical and electrical design results in low power consumption; the unit can be operated up to 7 hours (for continuous recording) on a single AA alkaline battery. Advanced user conveniences include a multifunction LCD readout. The unit's compactness and energy-efficiency, in particular, are attributes that cannot be matched by existing analog and digital audio formats. The size, performance, and features of the NT format are of benefit primarily to those who desire improved portability and audio quality in a personal memo product. The NT Recorder is the result of over ten years of intensive, multi-disciplinary research and development. What follows is a discussion of the technologies that have made the NT possible: (1) NT format mechanics, (2) NT media, (3) NT circuitry and board. Author (revised)

RAID 7 DISK ARRAY c61
Lloyd Stout *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 159-161 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

Each RAID level reflects a different design architecture. Associated with each is a backdrop of imposed limitations, as well as possibilities which may be exploited within the architectural constraints of that level. There are three unique features that differentiate RAID 7 from all other levels. RAID 7 is asynchronous with respect to usage of I/O data paths. Each I/O drive (includes all data and one parity drives) as well as each host interface (there may be multiple host interfaces) has independent control and data paths. This means that each can be accessed completely, independently, of the other. This is facilitated by a separate device cache for each device/interface as well. RAID 7 is asynchronous with respect to device hierarchy and data bus utilization. Each drive and each interface is connected to a high speed data bus controlled by the embedded operating system to make independent transfers to and from central cache. RAID 7 is asynchronous with respect to the operation of an embedded real time process oriented operating system. This means that exclusive and independent of the host, or multiple host paths, the embedded OS manages all I/O transfers asynchronously across the data and parity drives. A key factor to consider is that of the RAID 7's ability to anticipate and match host I/O usage patterns. This yields the following benefits over RAID's built around micro-code based architectures. RAID 7 appears to the host as a normally connected Big Fast Disk (BFD). RAID 7 appears, from the perspective of the individual disk devices, to minimize the total number of accesses and optimize read/write transfer requests. RAID 7 smoothly integrates the random demands of independent users with the principles of spatial and temporal locality. This optimizes small, large, and time sequenced I/O requests which results in users having an I/O performance which approaches performance to that of main memory. Author (revised)

TUTORIAL: PERFORMANCE AND RELIABILITY IN REDUNDANT DISK ARRAYS c61
Garth A. Gibson *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 163-202 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

A disk array is a collection of physically small magnetic disks that is packaged as a single unit but operates in parallel. Disk arrays capitalize on the availability of small-diameter disks from a price-competitive market to provide the cost, volume, and capacity of current disk systems but many times their performance. Unfortunately, relative to current disk systems, the larger number of components in disk arrays leads to higher rates of failure. To tolerate failures, redundant disk arrays devote a fraction of their capacity to an encoding of their information. This redundant information enables the contents of a failed disk to be recovered from the contents of non-failed disks. The simplest and least expensive encoding for this redundancy, known as N+1 parity is highlighted. In addition to compensating for the higher failure rates of disk arrays, redundancy allows highly reliable secondary storage systems to be built much more cost-effectively than is now achieved in conventional duplicated disks. Disk arrays that combine redundancy with the parallelism of many small-diameter disks are often called Redundant Arrays of Inexpensive Disks (RAID). This combination promises improvements to both the performance and the reliability of secondary storage. For example, IBM's premier disk product, the IBM 3390, is compared to a redundant disk array constructed of 84 IBM 0661 3 1/2-inch disks. The redundant disk array has comparable or superior values for each of the metrics given and appears likely to cost less. In the first section of this tutorial, I explain how disk arrays exploit the emergence of high performance, small magnetic disks to provide cost-effective disk parallelism that combats the access and transfer gap problems. The flexibility of disk-array configurations benefits manufacturer and consumer alike. In contrast, I describe in this tutorial's second half how parallelism, achieved through increasing numbers of components, causes overall failure rates to rise. Redundant disk arrays overcome this threat to data reliability by ensuring that data remains available during and after component failures. Author (revised)

STRIPED TERTIARY STORAGE ARRAYS
Ann L. Drapeau *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 203-213 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

Data stripping is a technique for increasing the throughput and reducing the response time of large access to a storage system. In striped magnetic or optical disk arrays, a single file is striped or interleaved across several disks; in a striped tape system, files are interleaved across tape cartridges. Because a striped file can be accessed by several disk drives or tape recorders in parallel, the sustained bandwidth to the file is greater than in non-striped systems, where access to the file are restricted to a single device. It is argued that applying striping to tertiary storage systems will provide needed performance and reliability benefits. The performance benefits of striping for applications using large tertiary storage systems is discussed. It will introduce commonly available tape drives and libraries, and discuss their performance limitations, especially focusing on the long latency of tape accesses. This section will also describe an event-driven tertiary storage array simulator that is being used to understand the best ways of configuring these storage arrays. The reliability problems of magnetic tape devices are discussed, and plans for modeling the overall reliability of striped tertiary storage arrays to identify the amount of error correction required are described. Finally, work being done by other members of the Sequoia group to address latency of accesses, optimizing tertiary storage arrays that perform mostly writes, and compression is discussed. The government faces a crisis in data storage, analysis, archive, and communication. The sheer quantity of data being poured into the government systems on a daily basis is overwhelming systems ability to capture, analyze, disseminate, and store critical information. Future systems requirements are even more formidable: with single government platforms having data rate of over 1 Gbit/sec, greater than Terabyte/day storage requirements, and with expected data archive lifetimes of over 10 years. The charter of the National Media Laboratory (NML) is to focus the resources of industry, government, and academia on government needs in the evaluation, development, and field support of advanced recording systems. EVALUATION OF D-1 TAPE AND CASSETTE CHARACTERISTICS: MOISTURE CONTENT OF SONY AND AMPEX D-1 TAPES WHEN DELIVERED **c35**
Gary Ashton *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 217-238 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

Commercial D-1 cassette tapes and their associated recorders were designed to operate in broadcast studios and record in accordance with the International Radio Consultative Committee (CCIR) 607 digital video standards. The D-1 recorder resulted in the Society of Motion Picture and Television Engineers (SMPTE) standards 224 to 228 and is the first digital video recorder to be standardized for the broadcast industry. The D-1 cassette and associated media are currently marketed for broadcast use. The recorder was redesigned for data applications and is in the early stages of being evaluated. The digital data formats used are specified in MIL-STD-2179 and the American National Standards Institute (ANSI) X3.175-190 standard. In early 1990, the National Media Laboratory (NML) was asked to study the effects of time, temperature, and relative humidity on commercial D-1 cassettes. The environmental range to be studied was the one selected for the Advanced Tactical Air Reconnaissance System (ATARS) program. Several discussions between NML personnel, ATARS representatives, recorder contractors, and other interested parties were held to decide upon the experimental plan to be implemented. Review meetings were held periodically during the course of the experiment. The experiments were designed to determine the dimensional stability of the media and cassette since this is one of the major limiting factors of helical recorders when the media or recorders are subjected to non-broadcasting environments. Measurements were also made to characterize each sample of cassettes to give preliminary information on which purchase specifications could be developed. The actual tests performed on the cassettes and media before and after aging fall into the general categories listed. Author (revised)

GRAND CHALLENGES IN MASS STORAGE: A SYSTEMS INTEGRATORS PERSPECTIVE
Richard R. Lee and Daniel G. Mintz (Culver, W. J. Consulting, Inc., Vienna, VA.) *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 239-243 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

Within today's much ballyhooed supercomputing environment, with its CFLOPS of CPU power, and Gigabit networks, there exists a major roadblock to computing success; that of Mass Storage. The solution to this mass storage problem is considered to be one of the 'Grand Challenges' facing the computer industry today, as well as long into the future. It has become obvious to us, as well as many others in the industry, that there is no clear single solution in sight. The Systems Integrator today is faced with a myriad of quandaries in approaching this challenge. He must first be innovative in approach, second choose hardware solutions that are volumetric efficient; high in signal bandwidth; available from multiple sources; competitively priced, and have forward growth extendibility. In addition he must also comply with a variety of mandated, and often conflicting software standards (GOSIP, POSIX, IEEE, MSRM 4.0, and others), and finally he must deliver a systems solution with the 'most bang for the buck' in terms of cost vs. performance factors. These quandaries challenge the Systems Integrator to 'push the envelope' in terms of his or her ingenuity and innovation on an almost daily basis. This dynamic is explored further, and an attempt to acquaint the audience with rational approaches to this 'Grand Challenge' is made. Author (revised)

The magnetic tape recorder has played an essential role in the capture and storage of instrumentation data for more than thirty years. During this time, data recording technology has steadily progressed to meet user demands for more channels, wider bandwidths, and longer recording durations. When acquisition and processing moved from analog to digital techniques, so recorder design followed suit. Milestones marking the evolution of the data recorder through these various stages - multi-track analog, high density longitudinal digital, and more recently rotary digital - have often represented important breakthroughs in the handling of ever-greater quantities of data. Throughout this period there has been a very clear line of demarcation between data storage methods in the 'instrumentation world' on the one hand and the 'computer peripheral world' on the other. This is despite the fact that instrumentation data, whether analog or digital at the point of acquisition, is now likely to be processed on a digital computer at some stage. Regardless of whether the processing device is a small personal computer, a workstation, or the largest supercomputer, system integrators have traditionally been faced with the same basic problem - how to interface what is essentially a manually controlled, continuously running device (the tape recorder) into the fast start/stop computer environment without resorting to an excessive amount of complex custom interfacing and performance compromise. The increasing availability of affordable high power processing equipment throughout the scientific world is forcing recorder manufacturers to make their latest and perhaps most important breakthrough - the computer-friendly data recorder. The operating characteristics of such recorders are discussed and the resultant impact on both data acquisition and data analysis elements of system configuration are considered. Author (revised)

As the demand for high data rate (up to 1 Gb/s), high density (down to 1 sq micron/bit) tape recorder increases, the main investigation trend is an improvement of the well known helical scan concept. The drawbacks of this technology are also well known; sophisticated mechanics, head to tape contact, and wear problems. In our fixed head approach, the recorder mechanics is made much more simple, but the complexity is turned towards the integrated magnetic components, which have to record and reproduce hundreds of tracks in parallel. Our multiplexed write inductive head and magneto-optical readout head will be described, and the global system performances evaluated. Author (revised)

In order to provide transparent access to data in network computing environments, high performance storage systems are getting smarter as well as faster. Magnetic tape instrumentation recorders contain an increasing amount of intelligence in the form of software and firmware that manages the processes of capturing input signals and data, putting them on media and then reproducing or playing them back. Such intelligence makes them better recorders, ideally suited for applications requiring the high-speed capture and playback of large streams of signals or data. In order to make recorders better storage systems, intelligence is also being added to provide appropriate computer and network interfaces along with services that enable them to interoperate with host computers or network client and server entities. Thus, recorders are evolving into high-performance storage systems that become an integral part of a shared information system. Data tape has embarked on a program with the Caltech sponsored Concurrent Supercomputer Consortium to develop a smart mass storage system. Working within the framework of the emerging IEEE Mass Storage System Reference Model, a high-performance storage system that works with the STX File Server to provide storage services for the Intel Touchstone Delta Supercomputer is being built. Our objective is to provide the required high storage capacity and transfer rate to support grand challenge applications, such as global climate modeling. Author (revised)

MASS OPTICAL STORAGE-TAPE (MOST)
William S. Oakley *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 257-264 (For primary document see N93-30449 11-82)
Avail: CASI HC A02/MF A03

In today's large mainframe and supercomputer environment there exists a continuous demand for increased performance in digital storage systems. The user need for near-line storage capacity is currently doubling every four years. In addition to higher capacity, a desire exists for higher data transfer rates, and longer term database archivability, at lower, and lower cost. Each component of this quartet of demands appears to be insatiable. Magnetic tape technology presently dominates the digital mass storage markets, but the continuous growth of requirements is drawing attention to the limitations of the technology as an archival mass storage medium. The lowest cost option currently available for long term data storage is to use magnetic tape, although it is not well suited to meeting the need for many tens of years of reliable storage. Today, the majority of magnetic tape mass storage systems are based on the IBM 3480/3490 (or compatible) tape drives. These drives offer only moderate transfer rates and relatively small increments of storage, both of which create a logistics problem due to the large numbers of cartridges necessary in a typical system and the time taken to transfer data. Both higher cartridge capacity and data transfer rates are available in some helical scan magnetic tape systems; however, these command a substantially higher price, exacerbating the cost problem, and are not compatible with most installed systems or tape databases. ICI OPTICAL DATA STORAGE TAPE: AN ARCHIVAL MASS STORAGE MEDIA
Andrew J. Ruddick *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 265-273 (For primary document see N93-30449 11-82)
Avail: CASI HC A02/MF A03

At the 1991 Conference on Mass Storage Systems and Technologies, ICI Imagedata presented a paper which introduced ICI Optical Data Storage Tape. This paper placed specific emphasis on the media characteristics and initial data was presented which illustrated the archival stability of the media. More exhaustive analysis that was carried out on the chemical stability of the media is covered. Equally important, it also addresses archive management issues associated with, for example, the benefits of reduced rewind requirements to accommodate tape relaxation effects that result from careful tribology control in ICI Optical Tape media. ICI Optical Tape media was designed to meet the most demanding requirements of archival mass storage. It is envisaged that the volumetric data capacity, long term stability and low maintenance characteristics demonstrated will have major benefits in increasing reliability and reducing the costs associated with archival storage of large data volumes. FLEXIBLE STORAGE MEDIUM FOR WRITE-ONCE OPTICAL TAPE
Andrew J. G. Strandjord, Steven P. Webb, Donald J. Perettie, and Robert A. Cipriano *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 275-284 (For primary document see N93-30449 11-82)
Avail: CASI HC A02/MF A03

A write-once data storage media was developed which is suitable for optical tape applications. The media is manufactured using a continuous film process to deposit a ternary alloy of tin, bismuth, and copper. This laser sensitive layer is sputter deposited onto commercial plastic web as a single-layer thin film. A second layer is sequentially deposited on top of the alloy to enhance the media performance and act as an abrasion resistant hard overcoat. The media was observed to have laser write sensitivities of less than 2.0 njoules/bit, carrier-to-noise levels of greater than 50dB's, modulation depths of approximately 100 percent, read-margins of greater than 35, uniform grain sizes of less than 200 Angstroms, and a media lifetime that exceeds 10 years. Prototype tape media was produced for use in the CREO drive system. The active and overcoat materials are first sputter deposited onto three mil PET film in a single pass through the vacuum coating system, and then converted down into multiple reels of 35mm x 880m tape. One mil PET film was also coated in this manner and then slit and packaged into 3480 tape cartridges. Author (revised)

ELECTRON TRAPPING DATA STORAGE SYSTEM AND APPLICATIONS Abstract Only
Daniel Brower, Allen Earman, and M. H. Chaffin *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 285 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

The advent of digital information storage and retrieval has led to explosive growth in data transmission techniques, data compression alternatives, and the need for high capacity random access data storage. Advances in data storage technologies are limiting the utilization of digitally based systems. New storage technologies will be required which can provide higher data capacities and faster transfer rates in a more compact format. Magnetic disk/tape and current optical data storage technologies do not provide these higher performance requirements for all digital data applications. A new technology developed at the Optex Corporation out-performs all other existing data storage technologies. The Electron Trapping Optical Memory (ETOM) media is capable of storing as much as 14 gigabytes of uncompressed data on a single, double-sided 54 inch disk with a data transfer rate of up to 12 megabits per second. The disk is removable, compact, lightweight, environmentally stable, and robust. Since the Write/Read/Erase (W/R/E) processes are carried out 100 percent photonically, no heating of the recording media is required. Therefore, the storage media suffers no deleterious effects from repeated Write/Read/Erase cycling. Author (revised)

MEASUREMENTS OVER DISTRIBUTED HIGH PERFORMANCE COMPUTING AND STORAGE SYSTEMS
Elizabeth Williams and Tom Myers (Department of Defense, Fort Meade, MD.) *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 295-297 (For primary document see N93-30449 11-82)
Avail: CASI HC A01/MF A03

Requirements are carefully described in descriptions of systems to be acquired but often there is no requirement to provide measurements and performance monitoring to ensure that requirements are met over the long term after acceptance. A set of measurements for various UNIX-based systems will be available at the 1992 Goddard Conference on Mass Storage Systems and Technologies. The authors invite others to contribute to the set of measurements. The framework for presenting the measurements of supercomputers, workstations, file servers, mass storage systems, and the networks that interconnect them are given. Production control and database systems are also included. Though other applications and third party software systems are not addressed, it is important to measure them as well. The capability to integrate measurements from all these components from different vendors, and from the third party software systems was recognized and there are efforts to standardize a framework to do this. The measurement activity falls into the domain of management standards. Standards work is ongoing for Open Systems Interconnection (OSI) systems management; AT&T, Digital, and Hewlett-Packard are developing management systems based on this architecture even though it is not finished. Another effort is in the UNIX International Performance Management Working Group. In addition, there are the Open Systems Foundation's Distributed Management Environment and the Object Management Group. A paper comparing the OSI systems management model and the Object Management Group model has been written. The IBM world has had a capability for measurement for various IBM systems since the 1970's and different vendors were able to develop tools for analyzing and viewing these measurements. Since IBM was the only vendor, the user groups were able to lobby IBM for the kinds of measurements needed. In the UNIX world of multiple vendors, a common set of measurements will not be as easy to get.

ANALYSIS OF CACHE FOR STREAMING TAPE DRIVE **c35**
V. Chinnaswamy *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 299-310 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

A tape subsystem consists of a controller and a tape drive. Tapes are used for backup, data interchange, and software distribution. The backup operation is addressed. During a backup operation, data is read from disk, processed in CPU, and then sent to tape. The processing speeds of a disk subsystem, CPU, and a tape subsystem are likely to be different. A powerful CPU can read data from a fast disk, process it, and supply the data to the tape subsystem at a faster rate than the tape subsystem can handle. On the other hand, a slow disk drive and a slow CPU may not be able to supply data fast enough to keep a tape drive busy all the time. The backup process may supply data to tape drive in bursts. Each burst may be followed by an idle period. Depending on the nature of the file distribution in the disk, the input stream to the tape subsystem may vary significantly during backup. To compensate for these differences and optimize the utilization of a tape subsystem, a cache or buffer is introduced in the tape controller. Most of the tape drives today are streaming tape drives. A streaming tape drive goes into reposition when there is no data from the controller. Once the drive goes into reposition, the controller can receive data, but it cannot supply data to the tape drive until the drive completes its reposition. A controller can also receive data from the host and send data to the tape drive at the same time. The relationship of cache size, host transfer rate, drive transfer rate, reposition, and ramp up times for optimal performance of the tape subsystem are investigated. Formulas developed will also show the advantages of cache watermarks to increase the streaming time of the tape drive, maximum loss due to insufficient cache, tradeoffs between cache and reposition times and the effectiveness of cache on a streaming tape drive due to idle times or interruptions due in host transfers. Several mathematical formulas are developed to predict the performance of the tape drive. Some examples are given illustrating the usefulness of these formulas. Finally, a summary and some conclusions are provided. Author (revised)

OPTIMIZING DIGITAL 8MM DRIVE PERFORMANCE **c35**
Gerry Schadegg *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1,

1993 p 317-328 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

The experience of attaching over 350,000 digital 8mm drives to 85-plus system platforms has uncovered many factors which can reduce cartridge capacity or drive throughput, reduce reliability, affect cartridge archivability and actually shorten drive life. Some are unique to an installation. Others result from how the system is set up to talk to the drive. Many stem from how applications use the drive, the work load that's present, the kind of media used and, very important, the kind of cleaning program in place. Digital 8mm drives record data at densities that rival those of disk technology. Even with technology this advanced, they are extremely robust and, given proper usage, care and media, should reward the user with a long productive life. The 8mm drive will give its best performance using high-quality 'data grade' media. Even though it costs more, good 'data grade' media can sustain the reliability and rigorous needs of a data storage environment and, with proper care, give users an archival life of 30 years or more. Various factors, taken individually, may not necessarily produce performance or reliability problems. Taken in combination, their effects can compound, resulting in rapid reductions in a drive's serviceable life, cartridge capacity, or drive performance. The key to managing media is determining the importance one places upon their recorded data and, subsequently, setting media usage guidelines that can deliver data reliability. Various options one can implement to optimize digital 8mm drive performance are explored. Author (revised)

USING TRANSPARENT INFORMED PREFETCHING (TIP) TO REDUCE FILE READ LATENCY **c60**
R. H. Patterson, G. A. Gibson, and M. Satyanarayanan *In* NASA. Goddard Space Flight Center, Goddard Conference on Mass Storage Systems and Technologies, Volume 1, 1993 p 329-342 (For primary document see N93-30449 11-82)
Avail: CASI HC A03/MF A03

As processor performance gains continue to outstrip Input/Output gains, I/O performance is becoming critical to overall system performance. File read latency is the most significant bottleneck for high performance I/O. Other aspects of I/O performance benefit from recent advances in disk bandwidth and throughput resulting from disk arrays, and in write performance derived from buffered write behind and the Log-structured File System. The access gap problem limiting improvements in read latency is exacerbated by distributed file systems operating over networks with diverse bandwidth. Focus is on extending the power of caching and prefetching to reduce file read latencies by exploiting hints from high-levels of a system. Such Transparent Informed Prefetching, TIP, and its benefits are described. It is argued that hints that disclose high level knowledge are a means for transferring optimization information across, without violating, module boundaries. How TIP can be used to convert the high throughput of new technologies such as disk arrays and log-structured file systems into low latency for applications is discussed. Our preliminary experiments show reductions in wall - clock execution time of 13 percent and 20 percent for a multiple module compilation tool (make) accessing data on a local disk and remote Coda file server, respectively, and a reduction of 30 percent for a text search (grep) remotely accessing many small files. PROPOSAL FOR A NUMERICAL ARRAY LIBRARY
26 Feb. 1993 15 p Presented at the American National Standards Institute X3 Information Processing Systems Meeting, Portland, OR, 11 Mar. 1993
(Contract DE-AC04-76DP-00789)
(DE93-010678; SAND-93-0670C; CONF-9303100-2) Avail: CASI HC A03/MF A01

One of the most widely recognized inadequacies of C is its low-level treatment of arrays. Arrays are not first-class objects in C; an array name in an expression almost always decays into a pointer to the underlying type. This is unfortunate, especially since an increasing number of high-performance computers are optimized for calculations involving arrays of numbers. On such machines, double left square bracket-right square bracket may be regarded as an intrinsic data type comparable to double or int and quite distinct from double. This weakness of C is acknowledged in the ARM, where it is suggested that the inadequacies of the C array can be overcome in C++ by wrapping it in a class that supplies dynamic memory management bounds checking, operator syntax, and other useful features. Such 'smart arrays' can in fact supply the same functionality as the first-class arrays found in other high-level, general-purpose programming languages. Unfortunately, they are typically expensive in both time and memory and make poor use of advanced floating-point architectures. The reasons for these difficulties are discussed in X3JI6/92-0076//WG21/N0153, 'Optimization of Expressions Involving Array Classes'. Is there a better solution? The most obvious solution is to make arrays first-class objects and add the functionality mentioned in the previous paragraph. However, this would destroy C compatibility and significantly alter the C++ language. Major conflicts with existing practice would seem inevitable. I propose instead that a numerical array class be adopted as part of the C++ standard library. This class will have the functionality appropriate for the intrinsic arrays found on most high-performance computers, and the compilers written for these computers will be free to implement it as a built-in class. On other platforms, this class may be defined normally, and will provide users with basic array functionality without imposing an excessive burden on the implementor. DOE

The 1991 'Neural Information Processing Systems-Natural and Synthetic' (NIPS) was held in Denver, CO, from 2-5 Dec. 1991. Since its inception in 1987, the NIPS conference has attracted researchers from many disciplines who are applying their expertise to problems in the field of neural networks. The conference and the following two day workshop have become a forum for presenting the latest research results and for leading researchers to gather and exchange ideas. The 1991 conference maintained the high level of excitement of its predecessors. Important new theoretical results were presented concerning the capability and generalization performance of networks. In order to increase user efficiency and possibilities in the use of experimental data processing distributive systems, based on personal computers, the automated experimental data processing workstations are created. Basic principles including different kinds of users and their access attributes, operating regimes, the roll of the intelligent computer assistant, and software and hardware needed are analyzed. The software includes the following: knowledge bases, data bases, AI system building tools, intelligent system applications, general programs, and other service and teaching programs. DOE

83 ECONOMICS AND COST ANALYSIS

Includes cost effectiveness studies.

N93-29100# California Univ., Berkeley.
PROPOSAL TO DEVELOP GUIDES FOR HIGH SCHOOL TEACHERS ON GLOBAL SYSTEMS SCIENCE
C. I. Sneider and R. Golden 16 Feb. 1993 4 p Prepared for California Univ., Davis
(Contract DE-FC03-90ER-61010)
(DE93-008759; DOE/ER-61010/T6) Avail: CASI HC A01/MF A01

The Lawrence Hall of Science requests funding for development of trial versions of five guides for high school teachers on the topic of Global Systems Science. The guides will reflect the guided-discovery approach for which the Lawrence Hall of Science has gained an international reputation. They will include a wealth of materials already developed as well as new materials, organized as a comprehensive program on global change. The guides could be used together for an entire one-semester course, or integrated individually into existing high school courses in the sciences and social studies. DOE

EVALUATING THE BIAS OF ALTERNATIVE COST PROGRESS MODELS: TESTS USING AEROSPACE INDUSTRY ACQUISITION PROGRAMS M.S. Thesis
David A. Tagg Dec. 1992 111 p
(AD-A262870) Avail: CASI HC A06/MF A02

The quality of cost estimates produced by each of four cost progress models - a random walk model, the traditional learning curve model, a production rate model (fixed-variable model), and a model incorporating both learning curve and production rate effects (Bemis production rate adjustment model) are evaluated. Emphasis is on assessing the level of bias associated with these models and determining the influence of various factors on model performance. Findings indicate, on average, the learning curve and Bemis models underestimate unit costs, while the random walk and fixed-variable models overestimate unit costs. Different factors are evaluated to determine their significance in explaining variations in the bias of unit cost predictions and relationships between the significant variables and model cost prediction bias are described. Findings indicate the Bemis model is superior to the other cost progress models because it exhibits the least bias and is not significantly influenced (in terms of bias) by variations in the factors considered. APPLIED RESEARCH IN AMERICA
G. H. Canavan Mar. 1993 8 p
(Contract W-7405-eng-36)
(DE93-011725; LA-12448-MS) Avail: CASI HC A02/MF A01

There are structural problems in the execution of applied research in America which interfere with its competitiveness. They are hard to correct within the industrial sector itself. National Laboratories have the structure and talents to supply the missing stage of research that could improve the innovation process. That would require the laboratory to shift to a project orientation, serious involvement with industrial research, and attention to market discipline. If the process was successful, it would develop a mechanism for transferring much of the laboratory's activity to private sponsorship. Even if it was not, it would provide a mechanism for scaling back laboratory activities in accord with their actual worth. DOE

N93-29329# Pacific Northwest Lab., Richland, WA.
TECHNOLOGY TRANSFER PERSONNEL EXCHANGE AT THE BOEING COMPANY
Z. I. Antoniak Mar. 1993 68 p
(Contract DE-AC06-76RL-01830)
(DE93-010190; PNL-8549) Avail: CASI HC A04/MF A01

The objective of the exchange was to transfer Pacific Northwest Laboratory (PNL) technology and expertise in advanced ceramic fabric composites (ACFC) to the Boeing Defense & Space Group (Boeing Aerospace). Boeing Aerospace was especially interested in applying PNL-developed ACFC technology to its current and future spacecraft and space missions. Boeing has on-going independent research and development (R&D) programs on advanced radiators and heat pipes; therefore, PNL research in ceramic fabric heat pipes was of particular interest to Boeing. Thus, this exchange assisted in the transfer of PNL's ACFC heat pipe technology and other related research capabilities to private industrial application. The project was proposed as an initial step in building a long-term collaborative relationship between Boeing and PNL that may result in future Cooperative Research and Development Agreements (CRADA's) and/or other types of collaborative efforts. DOE

TECHNOLOGY TRANSFER AND THE CIVIL SPACE PROGRAM. VOLUME 2: WORKSHOP PROCEEDINGS
1992 500 p Workshop held in McLean, VA, 17-19 Mar. 1992
(NASA-TM-108250; NAS 1.15:108250) Avail: CASI HC A21/MF A04

The objectives were to (1) provide a top-level review of the Integrated Technology Plan (ITP) and current civil space technology plans, including planning processes and technologies; (2) discuss and assess technology transfer (TT) experiences across a wide range of participants; (3) identify alternate categories/strategies for TT and define the objectives of transfer processes in each case; (4) identify the roles of various government 'stakeholders', aerospace industry, industries at large, and universities in civil space technology research, development, demonstration, and transfer; (5) identify potential barriers and/or opportunities to successful civil space TT; (6) identify specific needs for innovations in policy, programs, and/or procedures to facilitate TT; and (7) develop a plan of attack for the development of a workshop report. Papers from the workshop are presented. For individual titles, see N93-30693 through N93-30726.

N93-30693*# National Aeronautics and Space Administration, Washington, DC.
OAST SPACE RESEARCH AND TECHNOLOGY APPLICATIONS: TECHNOLOGY TRANSFER SUCCESSES
Gregory M. Reck *In its* Technology Transfer and the Civil Space Program. Volume 2: Workshop Proceedings 1992 26 p (For primary document see N93-30692 11-85)
Avail: CASI HC A03/MF A04

The ultimate measure of success in the Space Research and Technology Program is the incorporation of a technology into an operational mission. Charts are presented that describe technology products which OAST has helped support that (1) have been used in a space mission, (2) have been incorporated into the baseline design of a flight system in the development phase, or (3) have been picked up by a commercial or other non-NASA user. We hope that these examples will demonstrate the value of investment in technology. Pictured on the charts are illustrations of the technology product, the mission or user which has incorporated the technology, and where appropriate, results from the mission itself. SANDIA NATIONAL LABORATORIES
Laura R. Gilliom *In* NASA, Washington, Technology Transfer and the Civil Space Program. Volume 2: Workshop Proceedings 1992 7 p (For primary document see N93-30692 11-85)
Avail: CASI HC A02/MF A04

Sandia National Laboratories has identified technology transfer to U.S. industry as a laboratory mission which complements our national security mission and as a key component of the Laboratory's future. A number of technology transfer mechanisms - such as CRADA's, licenses, work-for-others, and consortia - are identified and specific examples are given. Sandia's experience with the Specialty Metals Processing Consortium is highlighted with a focus on the elements which have made it successful. A brief discussion of Sandia's potential interactions with NASA under the Space Exploration Initiative was included as an example of laboratory-to-NASA technology transfer. Viewgraphs are provided. NATIONAL MEDIA LABORATORY

Robert Clark *In* NASA, Washington, Technology Transfer and the Civil Space Program. Volume 2: Workshop Proceedings 1992 5 p (For primary document see N93-30692 11-85)
Avail: CASI HC A01/MF A04

A review of the National Media Laboratory (NML) is presented. The mission of the NML is to support current government user data storage needs and assist them in getting the most efficient 'commercial' solutions in the future. The motivation for a National Media Laboratory is as follows: recording systems are the major government image and data exploitation bottleneck; government data recording performance and storage requirements lead commercial practice by 3-5 years; the supporting commercial recorder industry is large but principally focused on video not data formats; lack of standards; and lack of transfer of commercial knowledge base to program offices and operational sites. TECHNOLOGY TRANSFER IN THE NASA AMES ADVANCED LIFE SUPPORT DIVISION

Kathleen Connell (Bionetics Corp., Moffett Field, CA.), Nelson Schlater (Bionetics Corp., Moffett Field, CA.), Vincent Bilardo, and Paul Masson (Amtech, Inc., Newton, MA.) *In* NASA, Washington, Technology Transfer and the Civil Space Program. Volume 2: Workshop Proceedings 1992 20 p (For primary document see N93-30692 11-85)
Avail: CASI HC A03/MF A04

This paper summarizes a representative set of technology transfer activities which are currently underway in the Advanced Life Support Division of the Ames Research Center. Five specific NASA-funded research or technology development projects are synopsized that are resulting in transfer of technology in one or more of four main 'arenas:' (1) intra-NASA, (2) intra-Federal, (3) NASA - aerospace industry, and (4) aerospace industry - broader economy. Each project is summarized as a case history, specific issues are identified, and recommendations are formulated based on the lessons learned as a result of each project. Derived from text

FORMULATION OF AMES 24E2 IR-BLACK COATING
Sheldon M. Smith Jul. 1991 9 p
(RTOP 188-78-44)
(NASA-TM-102864; A-90280; NAS 1.15:102864) Avail: CASI HC A02/MF A01

The formulation of Ames 24E2 IR-black coating and a rationale for the selection of its components are given. The objective was to make a very rough, very thick, and highly absorbing coating to attenuate the specular reflectance of telescope baffles at far-IR wavelengths. Application and curing instructions are also given. Outgassing measurements are quite low following a 24-hour radiative cure. Author

SPECTROSCOPIC AND PHOTOMETRIC STUDIES OF MAIN SEQUENCE M STARS AND A SEARCH FOR LATE-TYPE DWARFS IN THE SOLAR VICINITY Ph.D. Thesis
Joseph Davy Kirkpatrick 1992 774 p
Avail: Univ. Microfilms Order No. DA9307644

As any introductory astronomy student knows, M dwarfs are the most common stars in the Galaxy and are the faintest of the core hydrogen burners. A comprehensive study of these faint objects is crucial to our understanding of the stellar composition of the Galaxy and necessary for a more complete knowledge of the transition between main sequence M stars and their slightly less massive counterparts, the brown dwarfs, which never achieve hydrogen burning in their cores. In this thesis, a spectroscopic catalog of 125 K and M dwarfs is first presented. This catalog covers the wavelength range from 6300 to 9000 A, near where these objects emit most of their light. Eight of these spectra, covering classes M2 through M9, are combined with infrared spectra from 0.9 to 1.5 micro meters to create a second catalog. The two sets of spectra are used to search for temperature-sensitive atomic lines and molecular bands, which are then used in fitting the observed spectra to a sequence of theoretical models. As a result, a new temperature scale for M dwarfs is determined, and this scale is more accurate than previous determinations which have depended on black body energy distributions. The sequence of spectra is also used to compare the spectrum of the brown dwarf candidate GD 165 B to known M dwarfs. Furthermore, the spectral catalog is used in an attempt to separate the spectra of faint companions from their M dwarf primaries in systems where the two objects are too close for conventional spectroscopy to resolve the individual components. A survey for faint M dwarfs is also launched using the data acquired through the CCD/Transit Instrument (CTI) on Kitt Peak, Arizona. Follow-up spectroscopy is presented for 133 of these objects, and several more very late M dwarfs are identified. This spectroscopy combined with photometric data from the CTI are used to construct a luminosity function for M dwarfs which is in excellent agreement with determinations from previous surveys. Finally, possible avenues for future work are discussed. These include spectroscopic follow-up of the reddest of Luyten's proper motion objects the first results from which have uncovered, in just twelve observations, two objects of type M7 and one of type M8, among the coolest objects yet recognized. Future searches, such as an all-sky survey for objects of extremely high proper motion, are also outlined. Dissert. Abstr.

IUE OBSERVATIONS OF CATACLYSMIC VARIABLE Final Technical Report, 1979 - 1993
Paula Szkody 20 Jun. 1993 5 p
(Grant NsG-5395)
(NASA-CR-193188; NAS 1.26:193188) Avail: CASI HC A01/MF A01

Twenty two approved International Ultraviolet Explorer (IUE) programs were studied over a 14 year period. These programs are listed. The observations and subsequent analysis centered on cataclysmic variables (close binaries with a late main sequence star transferring material to a primary white dwarf via an accretion disk). The early studies highlighted the flux distribution of the accretion disk at outburst and quiescence, while later studies accomplished time-resolved observations throughout the orbital cycles, the study of the outflowing winds present at outburst, the study of the white dwarf in those systems with low accretion rate. There are 39 publications resulting from this work which are listed. These results include those for individual systems (Stepanian's star, Lanning 10, AM Her, MV Lyr, TV Col, VW Hyi, T Leo, IR Gem, TT Ari, Z Cam, BV Pup, IP Peg, PG1030+590, V1315 Aql, SW UMa, V426 Oph, WZ Sge, BY Cam, and U Gem) as well as review articles in journals and publications from reviews at meetings that summarize the impact of IUE on the study of accretion disks, white dwarfs, and hot spots resulting from stream impact as well as magnetic accretion columns. FAR INFRARED SUPPLEMENT. THIRD EDITION: CATALOG OF INFRARED OBSERVATIONS (LAMBDA GREATER THAN OR EQUAL TO 4.6 MICROMETERS)
Daniel Y. Gezari, Marion Schmitz (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), Patricia S. Pitts (Computer Sciences Corp., Calverton, MD.), and Jaylee M. Mead Washington Jun. 1993 375 p
(NASA-RP-1295; Rept-93A00689; NAS 1.61:1295) Avail: CASI HC A16/MF A03

The Far Infrared Supplement contains a subset of the data in the full Catalog of Infrared Observations (all observations at wavelengths greater than 4.6 microns). The Catalog of Infrared Observations (CIO), NASA RP-1294, is a compilation of infrared astronomical observational data obtained from an extensive literature search of scientific journals and major astronomical catalogs and surveys. The literature search is complete for years 1965 through 1990 in this third edition. The catalog contains about 210,000 observations of roughly 20,000 individual sources, and supporting appendices. The expanded third edition contains coded IRAS 4-band data for all CIO sources detected by IRAS. The appendices include an atlas of infrared source positions (also included in this volume), two bibliographies of catalog listings, and an atlas of infrared spectral ranges. The complete CIO database is available to qualified users in printed, microfiche, and magnetic tape formats. Author (revised)

PRECISION OPTICAL INTERFEROMETRY IN SPACE Final Report, 6 Feb. 1989 - 31 Jan. 1993
Robert D. Reasenberg Jul. 1993 68 p
(Grant NAGw-1647)
(NASA-CR-193264; NAS 1.26:193264) Avail: CASI HC A04/MF A01

POINTS, an astrometric Optical interferometer with a nominal measurement accuracy of 5 microarcseconds for the angle between a pair of stars separated by about 90 deg, is presently under consideration by two divisions of NASA-OSSA. It will be a powerful new multi-disciplinary tool for astronomical research. If chosen as the TOPS-1 (Toward Other Planetary Systems) instrument by the Solar-System Exploration Division, it will perform a definitive search for extra-solar planetary systems, either finding and characterizing a large number of them or showing that they are far less numerous than now believed. If chosen as the AIM (Astrometric Interferometry Mission) by the Astrophysics Division, POINTS will open new areas of astrophysical research and change the nature of the questions being asked in some old areas. In either case. it will be the first of a new class of powerful instruments in space and will prove the technology for the larger members of that class to follow. Based on a preliminary indication of the observational needs of the two missions, we find that a single POINTS mission will meet the science objectives of both TOPS-1 and AIM. The instrument detects dispersed fringe (channel led spectrum) and therefore can tolerate large pointing errors. Author (revised)

SODIUM GUIDE STAR ADAPTIVE OPTICS SYSTEM FOR ASTRONOMICAL IMAGING IN THE VISIBLE AND NEAR-INFRARED
D. T. Gavel, J. R. Morris, and R. G. Vernon (Science Applications International Corp., Palm Beach Gardens, FL.) Mar. 1992 19 p Presented at the Laser Guide Star Adaptive Optics Workshop, Albuquerque, NM, 10-12 Mar. 1992
(Contract W-7405-eng-48)
(DE93-009543; UCRL-JC-109606; CONF-9203139-4) Avail: CASI HC A03/MF A01

We are building an adaptive-optic telescope system that is based on the use of an artificial guide star created by laser-induced fluorescence of the sodium mesospheric layer. This paper discusses the system design for mid-visible to near-infrared compensation of a one meter telescope at Livermore and near-infrared compensation of the ten meter Keck telescope at Mauna Kea. We calculate the expected Strehl ratio and resolution for a 69 channel deformable mirror system and also for a possible 241 channel system upgrade. With the 69 actuator system we expect near diffraction limited resolution, about 0.2 arcsec, with a Strehl ratio of about 0.5 at (lambda)=0.8,(mu)m on the 1m telescope, and resolution of about 0.05 arcsec with a Strehl ratio of about 0.5 at lambda = 2.0 microns on the 10 m telescope. Resolution will be limited by the performance of the tip/tilt correction loop, which uses an off-axis natural guide star as a reference. The effects which degrade tip/tilt correction are described in a companion paper. At Livermore, our design uses an existing high power (1 kW) laser source, which is expected to provide an approximately 6th magnitude artificial guide star. This strong beacon signal allows a short integration time in the wavefront sensor so that temporal changes in the atmospheric turbulence can be tracked accurately. For Mauna Kea, we explore how the system to be built for the Livermore site would perform in the infrared, assuming a 100 W laser source. DOE

N93-29811*# National Aeronautics and Space Administration. Goddard Space Flight Center, Greenbelt, MD.
BONNER DURCHMUSTERUNG (SOUTHERN DURCHMUSTERUNG)
Washington May 1993 382 p
(Contract NAS5-30960)
(NASA-RP-1298-Vol-3; NAS 1.61:1298-Vol-3; Rept-93B00049) Avail: CASI HC A17/MF A03

The Southern Durchmusterung (SD, Schoenfeld 1886, Becker 1949, Schmidt 1967) is a visual survey of stars in the declination zones -02 to -23 deg, completed as an extension to Argelander's (1859-62) monumental Bonner Durchmusterung (BD). Schoenfeld's survey was carried out using the same methods as had been used for the BD. The procedure consisted of allowing the telescope to drift along the mean declination of each zone and recording the positions and magnitudes of stars crossing the transit line of each field. The goal of the survey was to extend the BD to declination -23 deg (a plan originally adopted by Argelander) with approximately the same magnitude limits, although the primary instrument was of larger aperture (159 mm) than the 78-mm telescope used for the BD. Thus, whereas the BD magnitude estimates extend to 9.4 mag with all fainter stars assigned a magnitude of 9.5, the SD magnitude estimates extend to 9.9 mag with all fainter stars assigned a magnitude of 10. The SD contains a number of stars fainter than 10.0 mag and even some as faint as 11 mag. Lists of all corrections made to the original data as a result of published corrigenda, stars deleted according to overstriking in the printed catalogs or their inclusion in lists of 'missing' stars, and stars inserted in later editions are given. No other corrections or changes have been incorporated into the original data, e.g., from more modern positions and magnitudes or from comparison with other catalogs.

N93-30493 California Inst. of Tech., Pasadena.
THE FAINTEST STARS Ph.D. Thesis
Christopher Geoffrey Tinney 1993 250 p
Avail: Univ. Microfilms Order No. DA9307053

A 270 square degree photometric catalogue from plate material of the UKSRC and POSSII surveys was constructed. The procedures used and quality checks applied are described in detail, and should be considered as illustrative for those planning scientific programs with the forthcoming scans of these surveys. Infrared JHKLL photometry and low resolution infrared spectra (lambda is approximately equal to 1.0-2.5 microns) for a selection of the latest stars known are presented. The combined photometric and spectral data are used to evaluate bolometric corrections and bolometric magnitudes for late type M-dwarfs almost 2-magnitudes fainter than the faintest previously measured objects. Some of the current problems associated with the effective temperature scale for very low mass stars was examined. First results are presented from a CCD trigonometric parallax program at the Palomar 60 in telescope. The number of extremely late

M-dwarfs (M(sub bol) greater than 13) with directly measured distances was doubled. Structure in the main-sequences so constructed suggest that the faintest known stars may not be stably supported by nuclear burning. It is shown that sigma(pi) less than or equal to 0.004 in. can be obtained in a few years using standard CCD's on a common-user telescope. Infrared K-band photometry of complete samples of VLM candidates selected by our photographic catalogues are presented, and a bolometric luminosity function which extends to M(sub bol) = 13.75 was constructed. Significant evidence for a luminosity function decreasing towards these luminosities was found. The data are consistent with the results of studies based on the Nearby Star sample. The observed LF was converted into the form of a mass function which extends with reasonable statistics to 0.08 solar mass - the H-burning minimum mass. The mass function 'turns over' at approximately 0.25 solar mass, goes through a local minimum at approximately 0.15 solar mass, and seems to increase again below 0.1 solar mass - none of these features are predicted by any of the current theories of star formation. Lastly, the mass density observed just above the H-burning minimum mass makes it difficult to envisage brown dwarfs contributing significant quantities of missing mass without invoking either a mass function in this region significantly steeper than that seen for main sequence stars, or an extremely low cut-off mass to the mass function.

ROSAT DETECTION OF STELLAR X RAY SOURCES IN THE OLD OPEN CLUSTER M67
T. Belloni, F. Verbunt (Utrecht State Univ., Netherlands.), and J. H. M. M. Schmitt Aug. 1992 20 p Submitted for publication
(Grant NWO-PGS-78-277)
(MPE-Preprint-230; ETN-93-93941) Copyright Avail: Max-Planck-Inst. fuer Extraterrestrische Physik, D-8046 Garching, Germany

The observations of M67 with the Rosat satellite are discussed. The detected x-ray sources show a strong concentration towards the optical cluster which leads to the belief that most of the sources are actually associated with M67. In particular, the observation shows an x-ray counterpart for the cataclysmic variable recently discovered in M67. A larger fraction of the x-ray sources identified with M67 cluster members are binaries. It is shown that the x-ray properties of these stars make them good candidates for RS CVn systems in M67. ESA

SUBMILLIMETER CO OBSERVATIONS OF WARM GAS AROUND T-TAURI STARS
K. F. Schuster (Hawaii Univ., Hilo.), A. I. Harris (Hawaii Univ., Hilo.), N. E. Anderson (Hawaii Univ., Hilo.), and A. P. G. Russell (Royal Observatory, Edinburgh, Scotland.) Oct. 1992 18 p Submitted for publication
(MPE-Preprint-232; ETN-93-93942) Copyright Avail: Fachinformationszentrum Karlsruhe, 7514 Leopoldshafen-Eggenstein 2, Germany

The first observations of T-Tauri stars in the (12)CO (6 to 5) line are reported. The observations trace the dynamics of warm and dense gas in a scale below 10 arcseconds. The CO submillimeter emission probably originates in the interaction of a stellar wind with a high column density of molecular material close to the stars. Additional CO data show that the emission extensions and line widths in T-Tau and HL-Tau are not consistent with Keplerian rotation or residual infall but can be explained by warm, dense, slowly outflowing material. The molecular outflow rate is at least 10 to the -6th power of the solar mass per year for T-Tau and 10 to the -7th power of the solar mass per year for HL-Tau, and may contribute to the dissipation of the clouds in which these stars formed. It is concluded that the dust associated with the warm molecular outflows accounts for a substantial fraction of T-Tau's and HL-Tau's far infrared continuum emission. ESA

NEAR-INFRARED LINE IMAGING OF NGC 6240: GLOBAL SHOCK AND NUCLEAR STARBURST
P. P. vanderWerf, R. Genzel, A. Krabbe, M. Blietz, S. Drapatz, M. J. Ward (Oxford Univ., England.), and D. A. Forbes (Cambridge Univ., England.) Jun. 1992 52 p Submitted for publication Sponsored in part by Isaac Newton Studentship
(MPE-Preprint-226; ETN-93-93938) Copyright Avail: Max-Planck-Inst. fuer Extraterrestrische Physik.

Images of the luminous galaxy NGC 6240 in the H2 v = 1 to 0 S(1) 2.12 micrometers line and the (FeII) 1.64 micrometer line are presented. The images have an angular resolution of approximately = or less than 1 second, and for the H2 line, images in three adjacent 320 km/s wide velocity intervals are presented. The H2 emission extends over approximately 5 kpc and shows a complex morphology and chaotic velocity structure in its outer parts. It is concluded that the H2 emission is generated in large scale shocks resulting from the collision of the interstellar media of the merging galaxies. Line ratios indicate that the shock velocity is at most 40 km/s. It is shown that the shocks in NGC 6240 cannot account for the observed far-IR emission. In contrast to the H2 emission, the (FeII) emission comes from the nuclei of the galaxy and is generated in fast SNR shocks resulting from a nuclear starburst. The high (FeII)/Br-gamma ratio indicates a high iron abundance, probably resulting from efficient processing of the nuclear ISM in the starburst. Other aspects of this study are discussed.

REJECTION OF ARCHIVAL PHOTOGRAPHIC OBJECTS AS OPTICAL COUNTERPARTS OF GAMMA RAY BURSTERS
J. Greiner Jul. 1992 20 p Submitted for publication
(MPE-Preprint-228; ETN-93-93939) Copyright Avail: Fachinformationszentrum Karlsruhe, 7514 Leopoldshafen-Eggenstein 2, Germany

The question of possible optical counterparts of gamma ray bursts from unique archival photographic plates is discussed. The photographic plates are evaluated under the reflected light microscopy, which is a valuable tool to detect plate defects. The analysis shows that two of the three objects found by Shaefer are plate defects, and serious doubts exist about the reality of the third. None of these three objects can be regarded as a candidate object for the optical counterpart of gamma ray bursts. There are still some possible candidates for possible optical counterparts of gamma ray bursts; however, it is still unproven that gamma ray bursts are accompanied by optical flashes. ESA

INFRARED SPECTROSCOPY AND IMAGING OF STARBURST GALAXIES AND AGNs
R. Genzel, M. Cameron, and A. Krabbe Jul. 1992 29 p Submitted for publication
(MPE-Preprint-229; ETN-93-93940) Copyright Avail: Fachinformationszentrum Karlsruhe, 7514 Leopoldshafen-Eggenstein 2, Germany

High resolution data from infrared spectroscopy and imaging of starburst galaxies and Active Galactic Nuclei (AGN's) are discussed. Observations of starburst galaxies NGC 253, the interacting galaxy NGC 6240 and the Seyfert 2 galaxy NGC 1068 are emphasized. In the starburst galaxy NGC 253, the H2 emission comes from giant, circumnuclear star formation complexes assiciated with dense molecular clouds. In the merger NGC 6240, the H2 emission appears to originate in slow, large scale shocks of the two colliding interstellar media. In the Seyfert 2 galaxy NGC 1068, the H2 emission comes from molecular clouds in the narrow line region that are probably excited by radiation from the nuclear source. The large infrared obscuration of the nucleus of NGC 1068 may be due to intervening molecular clouds in the narrow line region. Strong near infrared (Fe(II)) emission appears to be associated with supernova shocks in starburst galaxies and with the interaction between nuclear outflow and narrow line clouds in NGC 1068. Coronal line emission from highly ionized species like Si(VI) may signify embedded AGN's. ESA

DISTRIBUTION OF DARK MATTER IN THE GALAXY AND THE LOWER LIMITS FOR THE MASSES OF SUPERSYMMETRIC PARTICLES
V. S. Berezinsky (Laboratori Nazionali del Gran Sasso, Assergi, Italy.), A. V. Gurevich (Academy of Sciences, USSR, Moscow.), and K. P. Zybin (Academy of Sciences, USSR, Moscow.) Oct. 1992 15 p Sponsored in part by Alexander von Humbolt Foundation
(BONN-92-31; LNGS-92/40; ETN-93-93804) Avail: CASI HC A03/MF A01

An argument that the nonlinear stage of evolution of density fluctuations in a nondissipative gas results in the formation of a Nondissipative Gravitational Singularity (NGS) with density distribution rho(r) approximately r to the power of minus alpha where alpha is approximately equal to 1.8 is presented. This dependence holds from very small distance r(min) approximately 0.1 pc to very large distance r(max) approximately 5 Mpc. The predicted density distribution as well as the local density of the dark matter rho(stellar mass) is approximately equal to 0.3 GeV/cu cm are in good agreement with the observations. Dark matter particles have large space density in NGS and therefore, the rate of their annihilation is very high. This point like source of the radiation is the signature of NGS model. Assuming that dark matter in the Galaxy is composed mostly of neutralinos (approximately 70%) we calculate the flux of high energy gamma radiation and radio flux from the Galactic Center. ESA

MAGNETIC ACTIVITY IN LOW MASS STARS
S. L. Hawley 28 Dec. 1992 23 p Presented at the Hubble Fellows Symposium, Baltimore, MD, 9-11 Nov. 1992
(Contract W-7405-eng-48)
(DE93-009073; UCRL-JC-112640; CONF-9211209-1) Avail: CASI HC A03/MF A01

The manifestations of magnetic activity in low mass stars, particularly M dwarfs, can be used as a tool to study their evolution, the operation of the interior dynamo with changing interior conditions, and the structure of their outer atmospheres. Extensive background material on the current understanding of low mass stellar activity is presented. Two new surveys are described which will greatly increase the number of active low mass stars known in the field and in nearby open clusters. These surveys will define the characteristics of the activity on low mass stars, and how the activity changes with a number of parameters of interest, including mass, effective temperature, and age. The data will also allow a rigorous determination of a possible age-activity relation among the low mass M dwarfs. Theoretical models of M dwarf atmospheres, and their connection to the understanding of the observations, are also discussed. DOE

STELLAR ENCOUNTERS IN GLOBULAR CLUSTERS Ph.D. Thesis
Melvyn Barry Davies 1992 259 p
Avail: Univ. Microfilms Order No. DA9307541

This is a study of stellar encounters in globular clusters. I present 3D hydrodynamical simulations of collisions and close encounters between two single stars of various species. I show that the cross section for producing single, merged objects in such encounters is at least as large as that to produce detached binaries. I also consider encounters between binaries and a neutron star. The outcome of such encounters depends strongly on the separation of the components in the original binary. For extremely hard binaries, as may be formed from two single stars via tidal capture, a single merged object is the most likely outcome. In a small fraction of such encounters, the passing neutron star perturbs the two components of the binary such that their paths cross and they merge but remain unbound to the neutron star. Such encounters may be the mechanism to produce the high-velocity red giants observed in 47 Tuc. For primordial binaries, hardened to a separation of 0.2AU, clean exchanges seem the most likely outcome, though some 30 percent of exchange encounters lead to a merger between two of the stars, the coalesced object forming a binary with the third star. Applying King-Mitchie models to the globular clusters omega Cen, 47 Tuc, and NGC 6397, I compute the encounter rates between various stellar species and infer the production rates of objects of observational interest such as blue stragglers, millisecond pulsars (MSP's), and low-mass X-ray binaries (LMXB's). The production rate of merged objects containing neutron stars is also noted, as these systems may be a way to produce millisecond pulsars without passing through a precursor, X-ray emitting phase, as seems to be required by observations. I then consider the contribution of encounters between binaries and single stars, computing rates for reasonable binary populations in each of the three clusters. Such encounters may be the favored source of blue stragglers in globular clusters, in addition to producing merged objects that may later evolve into MSP's. A single population of hardened primordial binaries seems unable to boost the production rate of MSP's with respect to LMXB's by the factor of approx. 100 required by observations, although a more realistic binary population, with binaries having a range of separations and eccentricities, especially containing harder binaries, may be the solution. Dissert. Abstr.

NEAR-INFRARED SPECTROSCOPY AS AN ASTROPHYSICAL TOOL Ph.D. Thesis
Douglas Michael Kelly 1992 272 p
Avail: Univ. Microfilms Order No. DA9307648

Recent improvements in infrared detector arrays make it possible for the first time to conduct detailed spectroscopic studies of a complete range of objects in the 0.9-1.35 micron region. In this dissertation, I examine the 0.9-1.35 micron spectra of planetary and proto-planetary nebulae, M dwarfs, young stellar objects, Seyfert galaxies, an H II region, and a Wolf-Rayet star. Line identifications are made for each of these objects, and extensive line lists are presented. I also investigate what the lines can tell us about each object. The 0.9-1.35 spectrum of the proto-planetary nebula AFGL 618 is dominated by recombination lines, low-ionization, shock-excited lines, and thermal and fluorescent H2 lines. We use ratios of forbidden lines to show that there are two distinct physical regions in the lobes of AFGL 618, including one which must have been excited by shocks. We also show that the H2 lines in the 0.9-1.35 micron region are ideal for detecting low levels of fluorescent H2 emission, even when a strong thermal component is present. We present 0.6-1.5 micron spectra for M dwarfs ranging from M2 through M9. These spectra are compared with recent theoretical models, and a temperature scale is determined. In late-M dwarfs, the shape of the infrared spectrum and the depth of the 1.35 micron H2O feature are good temperature indicators. The temperatures we derive for the M dwarfs are higher than the temperatures found in earlier studies and are in closer agreement with theoretical tracks of the lower main sequence. We present 0.9-1.35 micron spectra for 7 young stellar objects. These objects exhibit a wide variety of behavior, including strong fluorescent emission. We show that the infrared spectra can be used to study all of the regions that are detected with visible and red spectra. As a result, 0.9-1.35 micron spectroscopy should be quite useful for studying heavily embedded sources. The 0.9-1.35 micron spectra of high-excitation objects include a number of distinctive features including He II lines, several high ionization lines, and very strong (S III) lines. We find that the excitation level of a source can be estimated based on these features alone. Dissert. Abstr.

THE USE OF OBJECTIVE PRISM RADIAL VELOCITIES FOR KINEMATIC STUDIES OF GALACTIC POPULATIONS Ph.D. Thesis

Rui Jorge L. S. Agostinho 1992 303 p
Avail: Univ. Microfilms Order No. DA9309837

Recent works do not agree about the number of Galactic populations and the solutions vary from models requiring two discrete populations, three discrete populations, to the continuous extended disk plus decoupled halo model. The objective prism survey by Rose has provided quantitative spectroscopic data for a kinematically unbiased study of Galactic populations in the magnitude range B is less than 12.5, i.e. up to a few hundred pc above the plane. In order to compute the velocity dispersion component sigma(sub zz) of these populations, the method of opposed dispersion plate pairs was used to obtain relative radial velocities of 956 stars in two fields at the SGP. Using the 4 deg + 6 deg prism combination in the Curtis Schmidt telescope (CTIO), the spectral resolution of 86.3 A/mm (at H(delta)) yields a radial velocity error distribution well described by a Gamma probability distribution function (pdf), which has final fitted parameters 15.5 +/- 7.0 km/s and 10.9 +/- 5.6 km/s (average +/- s.dev.) for the two fields. Since the velocity distribution seems to be well described by a gaussian, accurate (relative error of 1.5 percent G) velocity dispersions sigma(sub zz) for large samples, by curve fitting to both distributions were derived. For samples with less than 150 stars, Monte Carlo simulations using these two pdf's were run to estimate the error on sigma(sub zz). It was found that late-F stars have sigma(sub zz) = 21.8 +/- 3.7 km/s at B(sub mag) = 11 (50 stars), and sigma(sub zz) = 25.0 +/- 2.5 km/s at B(sub mag) = 12 (109 stars). The 112 G-dwarfs have sigma(sub zz) = 26.5 +/- 2.6 km/s at B(sub mag) = 12, almost identical to 27.5 +/- 2.5 km/s obtained by Gilmore & Wise (1987) to G-dwarfs at z = 200 pc. The 21 G-giants thick-disk candidates have sigma(sub zz) = 35.3 +/- 6.3 km/s comparable to the 37 km/s assigned by Carney et al (1989) to the thick-disk. The excellent agreement with higher resolution slit velocity dispersions shows that our very careful quantification of the errors translates into a reliable objective prism velocity dispersion, even for old thin disk typical values. SPHERICALLY SYMMETRIC MODEL ATMOSPHERES FOR LATE-TYPE GIANT STARS Ph.D. Thesis

Philip Desmond Bennett 1991 256 p
(ISBN-0-315-72632-6) Avail: Univ. Microfilms Order No. DANN72632

The ATHENA computer code was developed to model the extended atmospheres of late-type giant and supergiant stars. The atmospheres are assumed to be static, spherically symmetric and in radiative and hydrostatic equilibrium. Molecular line blanketing (for now) is handled using the simplifying assumption of mean opacity. The complete linearization method of Auer and Mihalas, adapted to spherical geometry, is used to solve the model system. The radiative transfer is solved by using variable Eddington factors to close the system of moment transfer equations, and the entire system of transfer equations plus constraints is solved efficiently by arrangement into the Rybicki block matrix form. The variable Eddington factors are calculated from the full angle-dependent formal solution of the radiative transfer problem using the impact parameter method of Hummer, Kunas. We were guided by the work of Mihalas and Hummer in their development of extended models of O stars, but our method differs in the choice of the independent variable. The radius depth scale used by Mihals and Hummer was found to fail because of the strongly temperature-dependent opacities of late-type atmospheres. Instead, we were able to achieve an exact linearization of the radius. This permitted the use of the numerically well-behaved column mass or optical depth scales. The resulting formulation is analogous to the plane-parallel complete linearization method and reduces to this method in the compact atmosphere limit. Models of M giants were calculated for T(sub eff) = 3000K and 3500K with opacities of the CN, TiO, and H2O molecules included, and the results were in general agreement with other published spherical models. These models were calculated assuming radiative equilibrium. The importance of convective energy transport was estimated by calculating the convective flux that would result from the temperature structure of the models. The standard local mixing length theory was used for this purpose. Convection was found to be important only at depths with tau(sub RM) greater than 15 for the low gravity models with log g = O, but significant out to tau(sub RM) is approximately 1 at the most transparent frequencies for the higher gravity models with log g = 2. Thus, the temperature structure of the surface layers and the emergent flux for the log g = O models should be accurately modelled but the emergent flux for the log g = 2 models may be in error by up to 5 percent at the most transparent frequencies. Author (revised)

DARK MATTER: THEORETICAL PERSPECTIVES

M. S. Turner Jan. 1993 26 p Presented at the NAS Special Colloquium on Physical Cosmology, Irvine, CA, Mar. 1992
(Contract DE-AC02-76CH-03000)
(DE93-008484; FNAL/C-92/382-A; CONF-9203232-1) Avail: CASI HC A03/MF A01

I both review and make the case for the current theoretical prejudice--a flat Universe whose dominant constituent is nonbaryonic dark matter--emphasizing that this is still a prejudice and not yet fact. The theoretical motivation for nonbaryonic dark matter is discussed in the context of current elementary-particle theory, and emphasis is placed on the following topics: (1) there are no dark matter candidates within the standard model of particle physics; (2) there are several compelling candidates within attractive extensions of the standard model of particle physics; and (3) the motivation for these compelling candidates comes from particle physics. The dark-matter problem is now a pressing issue in both cosmology and particle physics, and the detection of particle dark matter would provide evidence for a 'new physics.' The compelling candidates are: a very light axion (10(exp -6) eV - 10(exp -4) eV); a light neutrino (20 eV - 90 eV); and a heavy neutralino (10 GeV - 2 TeV). The production of these particles in the early Universe and the prospects for their detection are also discussed. I briefly mention more exotic possibilities for the dark matter, including a nonzero cosmological constant, superheavy magnetic monopoles, and decaying neutrinos. DOE

WHY BLUE STRAGGLERS FORMED VIA COLLISIONS MAY NOT BE RAPID ROTATORS

Peter J. T. Leonard and Maurice J. Clement (Toronto Univ., Ontario.) 1993 4 p Presented at the Space Telescope Science Institute (STSI) Conference on Blue Stragglers, Baltimore, MD, 12-13 Oct. 1992
(Contract W-7405-eng-36)
(DE93-008708; LA-UR-93-472; CONF-9210324-3) Avail: CASI HC A01/MF A01

We propose that the blue stragglers formed via collisions may not be rapid rotators due to magnetic braking during a Hayashi phase as they approach the main sequence. It is conceivable that just the envelopes of the blue stragglers are spun down, while their cores remain rapidly rotating. This would greatly extend the main-sequence lifetimes of the blue stragglers produced by collisions. DOE

N93-28906# Los Alamos National Lab., NM.

DO THE POP 2 FIELD BLUE STRAGGLERS HAVE A COLLISIONAL ORIGIN?

Peter J. T. Leonard 1993 5 p Presented at the Space Telescope Science Institute (STSI) Conference on Blue Stragglers, Baltimore, MD, 12-13 Oct. 1992
(Contract W-7405-eng-36)
(DE93-008709; LA-UR-93-471; CONF-9210324-2) Avail: CASI HC A01/MF A01

The hypothesis that the Pop 2 field blue stragglers have a collisional origin is considered. It appears unlikely that the majority of these stragglers were formed via collisions, but it is difficult to rule out the possibility that a small, but observable, fraction of them were. DOE

N93-28907# Los Alamos National Lab., NM.

CAN PHYSICAL STELLAR COLLISIONS EXPLAIN THE BLUE STRAGGLERS IN THE DWARF SPHEROIDAL GALAXIES?

Peter J. T. Leonard 1993 4 p Presented at the Space Telescope Science Institute (STSI) Conference on Blue Stragglers, Baltimore, MD, 12-13 Oct. 1992
(Contract W-7405-eng-36)
(DE93-008711; LA-UR-93-467; CONF-9210324-1) Avail: CASI HC A01/MF A01

The hypothesis that the blue stragglers in the dwarf spheroidal galaxie have a collisional origin is considered. If all of the dark matter in these galaxies is in the form of low-mass stars and the binary frequency is (approx equal) 50%, then it is quite possible that (approx equal) 10% to 20% of their blue stragglers have been produced by physical stellar collisions. DOE

N93-28908# Los Alamos National Lab., NM.

THE HEATING AND COOLING OF WZ Sge

W. M. Sparks, E. M. Sion (Villanova Univ., PA.), S. G. Starrfield, and S. Austin (Arizona State Univ., Tempe.) 1993 5 p Presented at the 2nd Technion Haifa Conference on Cataclysmic Variables and Related Physics, Elat, Israel, 11-14 Jan. 1993
(Contract W-7405-eng-36)
(DE93-008720; LA-UR-93-731; CONF-930111-1) Avail: CASI HC A01/MF A01

The observations of WZ Sge provide us with the best test for computational codes trying to calculate the accretion process onto a white dwarf. We find that the accreted material on WZ Sge cannot spread over the whole star at least on a time scale of ten years. Numerical models which include the angular momentum of the accreted material provide the best fit to the observations. DOE

N93-28945 California Inst. of Tech., Pasadena.

THE MULTIPLICITY OF T TAURI STARS IN THE STAR FORMING REGIONS TAURUS-AURIGA AND OPHIUCHUS-SCORPIUS: A 2.2 MICRON SPECKLE IMAGING SURVEY Ph.D. Thesis

Andrea Ghez 1993 253 p
Avail: Univ. Microfilms Order No. DA9307038

The results of a magnitude limited (K is less than or equal to 8.5 mag) multiplicity survey of T Tauri stars (TTS) in two nearby star forming regions (SFR), Tauru-Auriga and Ophiuchus-Scorpius. Each of the 69 stars in the sample was observed at K(2.2 microns) with an infrared array camera on the Hale 5-m Telescope at Palomar Observatory and imaged using two-dimensional speckle interferometric techniques. Thirty-three companion stars were found, of which 15 were new detections. A subset of 64 observations was sensitive to all companion stars in the projected linear range 14 to 225 AU and the magnitude difference range 0.0 to 2.0 mag. This subset and region were used to study the multiplicity of TTS; the frequency of companion stars within this region is 34 +/- 9 percent, independent of SFR. A distinction between the classical TTS (CTTS) and the weak-lined TTS (WTTS) based on the binary star frequency as a function of separation was discovered; the WTTS dominate the binary star distribution at the closer separations and the CTTS populate the wider separations. The cross over occurred near 100 AU, the size typically quoted for a circumstellar disk. We suggest that all TTS begin as CTTS and become WTTS when accretion has ceased, and that the nearby companion stars act to shorten the accretion time scale in multiple star systems. Integrated over all magnitude differences the binary star frequency in the projected linear separation range 14 to 225 AU for TTS (59 +/- 16 percent) is a factor of 3.5 greater than that of the solar-type main sequence stars (17 +/- 3 percent). Given the limited angular separation range that we are sensitive to, i.e., both the spectroscopic and wide binaries are missed, the rate at which binaries are detected suggests that most, if not all, TTS stars have companions. We propose that the observed overabundance of companions to TTS with respect to their older counterparts on the main sequence is an evolutionary effect; in this scheme triple and higher order TTS, which are observed at higher frequencies than for the solar-type main sequence stars, are disrupted by close encounters with another star or system of stars. Dissert. Abstr.

N93-28963# Fermi National Accelerator Lab., Batavia, IL.

TESTS OF THE PARTICLE PHYSICS-PHYSICAL COSMOLOGY INTERFACE

D. N. Schramm (Chicago Univ., IL.) Jan. 1993 12 p Presented at the International Symposium on Neutrino Astrophysics, Kamioka, Japan, Oct. 1992
(Contract DE-AC02-76CH-03000)
(DE93-008483; FNAL/C-93/022-A; CONF-9210316-1) Avail: CASI HC A03/MF A01

Three interrelated interfaces of particle physics and physical cosmology are discussed: (1) inflation and other phase transitions; (2) Big Bang Nucleosynthesis (and also the quark-hadron transition); and (3) structure formation (including dark matter). Recent observations that affect each of these topics are discussed. Topic number 1 is shown to be consistent with the COBE observations but not proven and it may be having problems with some age-expansion data. Topic number 2 has now been well-tested and is an established 'pillar' of the Big Bang. Topic number 3 is the prime arena of current physical cosmological activity. Experiments to resolve the current exciting, but still ambiguous, situation following the COBE results are discussed. DOE

LUNAR GRAVITATIONAL FIELD ESTIMATION AND THE EFFECTS OF MISMODELING UPON LUNAR SATELLITE ORBIT PREDICTION M.S. Thesis

John H. Davis Jun. 1993 165 p
(Contract NAS9-18436)
(NASA-CR-188249; NAS 1.26:188249; CSDL-T-1180) Copyright Avail: CASI HC A08/MF A02

Lunar spherical harmonic gravity coefficients are estimated from simulated observations of a near-circular low altitude polar orbiter disturbed by lunar mascons. Lunar gravity sensing missions using earth-based nearside observations with and without satellite-based far-side observations are simulated and least squares maximum likelihood estimates are developed for spherical harmonic expansion fit models. Simulations and parameter estimations are performed by a modified version of the Smithsonian Astrophysical Observatory's Planetary Ephemeris Program. Two different lunar spacecraft mission phases are simulated to evaluate the estimated fit models. Results for predicting state covariances one orbit ahead are presented along with the state errors resulting from the mismodeled gravity field. The position errors from planning a lunar landing maneuver with a mismodeled gravity field are also presented. These simulations clearly demonstrate the need to include observations of satellite motion over the far side in estimating the lunar gravity field. The simulations also illustrate that the eighth degree and order expansions used in the simulated fits were unable to adequately model lunar mascons. Author

SPACE OPTICAL AND LOW-FREQUENCY RADIO SEARCHES FOR EARTH-CROSSING ASTEROIDS AND COMETS

J. G. Hills and G. R. Gisler 1993 9 p Presented at the Hazards Due to Comets and Asteroids, Tucson, AZ, Jan. 1993
(Contract W-7405-eng-36)
(DE93-008716; LA-UR-93-599; CONF-930185-1) Avail: CASI HC A02/MF A01

Earth-crossing asteroids (ECA's) are small and backscatter strongly, so they are usually discovered near opposition during close approaches to Earth. This opposition effect produces strong biases in Earth-based searches for ECAS, particularly for Atens. An observing site much closer to the sun than the orbit of Earth, such as a satellite orbiting Venus or telescopes on Mercury, would not suffer this bias. All Atens that cross the orbit of Earth would be observable near opposition from these sites, so a survey from them would not systematically miss any large ECAS. A satellite at the Lagrangian point between the Earth and the sun would be effective in detecting objects in the final day before they hit Earth including asteroids and long-period comets that approach Earth from the sunward side. Outgassing comets present large cross sections to the solar wind. Spacecraft have observed low-frequency radio emission produced by the wiggling of the magnetic field in the solar wind as it sweeps past comets. Asteroids are expected to emit similar radio emission at lower power. This radiation may be observable by a radio array in space or on the moon. A satellite at the Lagrangian point could also detect the downstream solar wind wakes of comets and asteroids that approach Earth from the direction of the sun. Military surveillance satellites may be used to observe the fragmentation of large meteoroids in the atmosphere. Because it observes the entire atmosphere of Earth and is not affected by local weather conditions, such a surveillance network has a much larger cross section than a ground survey for observing the rare, large meteors that more closely approach the size of those that cause economic damage. DOE

GRO: RED-SHIFTED ELECTRON-POSITRON ANNIHILATION GAMMA-RAYS FROM RADIOPULSARS Annual Status Report, 15 Jul. 1992 - 14 Jul. 1993
Malvin Ruderman Jul. 1993 7 p
(Grant NAG5-2016)
(NASA-CR-193243; NAS 1.26:193243; CAL-2118) Avail: CASI HC A02/MF A01

Reported red-shifted e(+) + e(-) yields gamma + gamma 511 keV gamma-rays from the Crab pulsar would, if ultimately confirmed, provide crucial clues about the structure of the powerful magnetospheric accelerator in that rapidly spinning gamma-ray pulsar. In an attempt to understand the origin of this component of the Crab pulsar's emission, we try to account for the following: (1) a flow of approximately 10 exp 40 e(+/-)/s into near the surface of the neutron star; (2) a relatively narrow annihilation line implying that the annihilating e(+/-) pairs probably had a velocity (along vector B) less than or approximately = 10(exp -1)c; and (3) a tentative light curve suggesting a doubly peaked structure different from that of the rest of the Crab pulsar's nonthermal radiation. MODELS OF STAR FORMATION IN INTERACTING AND MERGING DISK GALAXIES Ph.D. Thesis
James Christopher Mihos 1992 133 p
Avail: Univ. Microfilms Order No. DA9308399

To better understand the role that interactions between galaxies plays in their overall evolution requires a clear picture of the types of interactions that trigger starburst events as well as an understanding of the specific star formation process in these starbursts. While the general occurrence of tidally triggered starbursts seems well demonstrated observationally, the specific response of star formation to a gravitational encounter is much less clear. In an effort to better understand the nature of the starburst trigger in interacting galaxies, numerical models of star forming interacting galaxies, which are then compared to observations of specific interacting systems, are constructed. The models show that in general, galaxy interactions trigger only mild increases in the global star formation rates (SRF's) of the participating galaxies. Starburst strengths for flyby interactions are a factor of a few at best and are strongest for prograde interactions. Mergers prove effective at triggering order-of-magnitude starbursts in the central regions of the merging galaxies; however, the relative scarcity of mergers ensures that very strong interaction-induced starbursts are rare. The starburst triggering mechanism is varied. The most intense starbursts are driven by gas inflow into the nuclear regions via a merger event or tidally-triggered bar formation. Less intense star formation may be induced through compressions of gas along the tidal arms, or direct collisions between the interacting ISM's. None of the mergers modeled were able to trigger starbursts much greater than an order of magnitude; this result makes it difficult to explain the emission from ultraluminous infrared galaxies through merger-induced star formation alone unless the merging galaxies were very gas rich. Furthermore, the merging process which produces such objects must occur rapidly; models of slow mergers depleted their ISM through star formation before developing the nuclear gas concentrations which could fuel an intense starburst. The models link these two criteria by showing that through a process of 'gas dynamical braking,' gas rich galaxies may merge more quickly than gas poor systems. Dissert. Abstr.

YOUNG OPEN CLUSTERS AS PROBES OF THE STAR FORMATION PROCESS Ph.D. Thesis
Randy Lee Phelps 1993 363 p
Avail: Univ. Microfilms Order No. DA9306742

The star formation history of a region in the Perseus spiral arm of our Galaxy was explored using digital photometry, in the UBV system, of 23 open clusters. Magnitudes and colors of 35,788 stars were measured, making this the most comprehensive, homogeneous, single study of open cluster properties in one part of the Galaxy. The improved knowledge of the spatial distribution and formation sequence of the clusters, coupled with other studies of radial velocities, proper motions, and gas distribution in the region, strongly suggests that the majority of these clusters were formed during the impact of a high velocity cloud (HVC) with the Galactic disk. HVC's were detected in this region and predictions of a recently published theoretical model of an HVC impact with the disk agree with the observational data extremely well. While it was suggested that HVC impacts can trigger star formation, this is the first time that star formation can be directly connected to such an event. Mass functions for 8 of the clusters were calculated for stars more massive than the Sun, covering a region of the initial mass function (IMF) inaccessible through studies of field stars. These data indicate that, to about one solar mass, the mass functions of clusters, on average, are the same as the so-called 'Salpeter field star IMF'. Deviations do occur, however, with evidence for a deficiency of low mass stars in several clusters. A dip in the IMF at a mass about 1.4 times that of the Sun is detected, at various levels of statistical significance, in six of the clusters. Variations in binary content were seen, although no obvious correlation with cluster age, mass, or size is found. This result has implications for theories of the formation of binary stars. Other uses of this data base are discussed, including an improvement in the cluster age/gas-content relation, and potential improvement in the Cepheid star period-luminosity relation, since previous studies have associated Cepheids with 3 of the clusters in this survey. CATASTROPHIC COLLISIONS: LABORATORY IMPACT EXPERIMENTS, HYDROCODE SIMULATIONS, AND THE SCALING PROBLEM Ph.D. Thesis
Eileen Valerie Cupta Ryan 1992 228 p
Avail: Univ. Microfilms Order No. DA9307670

The catastrophic fragmentation of finite targets is examined both in the laboratory and using a numerical hydrocode. The objective of the empirical study was to gain some insight into the collisional process, specifically, how impact conditions affect collisional outcome. The hydrocode allows us to investigate the fragmentation of large bodies, and to determine how target size influences the impact event. Nearly 150 experiments were performed. Impact velocities ranged from 50-5700 m/s; target material/structure as well as projectile type were varied, and the effect on fragment mass and velocity distributions was documented. Several factors were found to influence the result of a two-body collision: specific energy, momentum, target strength and internal structure, and projectile type. Velocity data showed that average fragment speeds are on the order of 10's of meters per second. Energy partitioned into ejecta kinetic energy is about 1.2 percent for high velocity collisions and more than 10 percent for low velocity impacts. Our two-dimensional hydrocode successfully reproduced fragment size distributions and mean ejecta velocities from laboratory impact experiments using basalt, and weak and strong mortar as target materials. It also reproduced size distributions from explosive disruption and applied external pressure experiments which used targets composed of weak mortar and weak basalt grout. Using this hydrocode, how target size influences the amount of energy (Q(sup *)) required for fracture is analyzed. Q(sup *) was found to decrease with increasing target size in the strength regime;

in the gravity regime where incoming stress waves must overcome both material bonds and self-compression, Q(sup *) increased with increasing target size. The Q(sup *) dependence on target size was found to be much stronger than predicted from scaling law theory. Dissert. Abstr.

MULTIWAVELENGTH STUDIES OF CLASSICAL NOVA SHELLS Ph.D. Thesis
Pedro Saizar 1992 138 p
Avail: Univ. Microfilms Order No. DA9307846

Ground-based optical and satellite ultraviolet spectrophotometric observations are combined in order to study the shells of Classical Novae PW Vulpeculae 1984 and QU Vulpeculae 1984. First, the chemical composition of each shell is derived from emission line ratios carefully selected to minimize the effects of variations in the physical conditions within the shell, such as density in homogeneities. The results indicate that PW Vul has a nearly solar composition, with the exception of nitrogen, which is enhanced. QU Vul shows a strong enhancement of helium and several intermediate weight elements. These results are in qualitative agreement with current theories of nova outbursts, suggesting that PW and QU Vul's outbursts occurred in a carbon-oxygen and an oxygen-neon-magnesium white dwarf, respectively. Next, the source of ionizing radiation is investigated from the observed continuous spectrum, and from radiative-equilibrium photoionization modeling. A flat, featureless continuum indicates that the expanding shell is hotter than the temperature derived from emission-line diagnostics. Thus, a model is proposed in which the 'cold phase' has a temperature of 10(exp 4), and the 'hot phase' is in the range of 10(exp 5) to 10(exp 6) K. Methods are presented to constraint the temperature and density of the hot phase, and other properties of the shell, such as the mass, the energetics, and the geometry. The results suggest that the tenuous hot phase dominates the mass of the outburst, while the cold phase is denser, strongly inhomogeneous, and responsible for most of the emission line spectrum. These results bring new light and challenges to the fields of nova outbursts and galactic structure. The large ejected masses in combination with the enhanced abundances suggest that novae may be significant contributors to the chemical enrichment of the Galaxy. In particular, the observed mass of aluminum in the Galaxy can be explained as the result of nova outbursts similar to the QU Vul system, provided that these systems represent only 1-2 percent of the total nova rate. However, theoretical challenges now exist to explain the mechanisms that allow such large ejecta in oxygen-neon-magnesium novae. Dissert. Abstr.

DENSE GAS IN THE MONOCEROS OB1 DARK CLOUD AND ITS RELATIONSHIP TO STAR FORMATION Ph.D. Thesis
Grace Annamarie Wolf 1992 172 p
Avail: Univ. Microfilms Order No. DA9307668

A CS survey of the 10 outflows and 30 IRAS sources identified by Margulis in the Mon OB1 dark cloud was conducted to study the relationship between outflows, young stellar objects (YSO's), and dense cores in this cloud. It was found that the CS J = 2 approaches 1 transition traces a large portion of the dense, low-velocity components of the outflows in Mon OB1. The mass of this component is found to be nearly an order of magnitude greater than previous estimates of the outflow 'core' component. Little CS gas around the quiescent sources was detected in this cloud. CS 2 approaches 1 temperatures and integrated intensities are 2 to 7 and 2 to 14 times higher, respectively, in the vicinities of IRAS sources associated with outflow activity than about the quiescent sources. This implies CS abundances, temperatures, and/or densities are enhanced in regions where outflows impact the ambient cloud. The CS 2 approaches 1 emission is concentrated in two regions encompassing 6 of the 10 previously identified outflows in this cloud. Four of these six outflows are identifiable in CS. Two, previously identified as monopolar outflows, exhibit bipolar structure in CS. The CS J = 5 approaches 4 transition was detected in the vicinity of 4 of the 10 outflows in this cloud, and around none of the quiescent IRAS sources. The CS 5 approaches 4 emission is extended around two of the outflow sources and was mapped in these regions. CS J = 7 approaches 6 emission was mapped about the brightest outflow source in this cloud. The morphology of the 7 approaches 6 region suggests it may have been part of the collimating structure for the outflow associated with this source. The velocity structure and binding energies of the 5 approaches 4 and 7 approaches 6 cores suggest the outflows are disrupting these cores. The addition of the low-velocity CS outflow component to previous estimates of outflow energetics implies multiple generations of outflows need not be required to support this cloud against collapse. Our results neither support nor rule out the existence of fossil outflows in this cloud. A full-cloud, unbiased survey is required to search for such outflows. Dissert. Abstr.

PREDICTIONS OF A NON-GAUSSIAN MODEL FOR LARGE SCALE STRUCTURE
Z. H. Fan and J. M. Bardeen 26 Jun. 1992 41 p
(Contract DE-FG06-91ER-40614)
(DE93-010196; DOE/ER-40614/26) Avail: CASI HC A03/MF A01

A modified CDM model for the origin of structure in the universe based on an inflation model with two interacting scalar fields, is analyzed to make predictions for the statistical properties of the density and velocity fields and the microwave background anisotropy. The initial gauge-invariant potential zeta which is defined as zeta = (delta)rho/(rho + p) + 3(var phi), where (var phi) is the curvature perturbation amplitude and p is the pressure, is the sum of a Gaussian field phi(sub 1), and the square of a Gaussian field phi(sub 2). A Harrison-Zel'dovich scale-invariant power spectrum is assumed for phi(sub 1); and a log-normal 'peak' power spectrum for phi(sub 2). The location and the width of the peak are described by parameters k(sub c) and a. respectively. The model is motivated to some extent by inflation models with two interacting scalar fields, but is mainly interesting as an example of a model whose statistical properties change with scale. On small scales, it is almost identical to a standard scale-invariant Gaussian CDM model. On scales near the location of the peak of the non-Gaussian field, the distributions have long tails in high positive values of the density and velocity fields. Thus, it is easier to get large-scale streaming velocities than the standard CDM model. The quadrupole amplitude of fluctuations of the cosmic microwave background radiation and the rms variation of the temperature field smoothed with a 10 deg FWHM Gaussian are calculated; a reasonable agreement is found with the new COBE results. DOE

A CHARACTERIZATION OF YOUNG STELLAR OBJECTS IN BOK GLOBULES: INFRARED IMAGING, SPECTRAL ENERGY DISTRIBUTIONS, AND MOLECULAR OUTFLOWS Ph.D. Thesis
Joao Lin Yun 1993 247 p
Avail: Univ. Microfilms Order No. DA9306747

A large-scale observational study of star formation in Bok globules is presented. A sample of 248 optically selected, small molecular clouds (mostly Bok globules) was probed using IRAS co-added images to search for associated young stellar objects (YSO's). Fifty-seven of the globules show evidence for a total of 72 point sources near locations of local dust heating. A sub-sample of 41 globules was observed, in the CO J = 1-0 line, to search for molecular outflows associated with the YSO's. Outflows were found in about one-third of the sample (14 of 41). The presence of an outflow was found to be correlated with the value of the IRAS-based spectral index (between 12 and 25 microns) of the YSO's. A near-infrared imaging survey of 34 globules containing YSO-candidates was conducted in the J, H, and K bands using infrared arrays. Eleven YSO-candidates displayed near-infrared nebulosities. This group of objects, when ordered by their values of the 12/25 microns spectral index, seems to form an evolutionary sequence, from younger objects with negative (red) indices and whose nebulosities are brighter in the K-band, to objects in later stages of pre-main-sequence evolution with positive (bluer) indices and whose nebular emission is brighter in the J-band. Comparison of the morphology of the infrared nebulae with the corresponding CO outflow morphology supports the idea that infrared reflection nebulae, seen at 2.2 microns, are good morphological tracers of CO mass outflow, and that CO outflows occur during the earliest YSO phases. Photometry of the near-infrared counterparts of the YSO-candidates was combined with their IRAS fluxes to yield broad-band spectral energy distributions (SED's). The broadness and steepness of the SED's indicated clear evidence of the evolutionary stage of the objects confirming their youth. Given all of the new information obtained, a firm conclusion emerged, namely that Bok globules are active sites of low-mass star formation. Dissert. Abstr.

TOPICS IN INFLATIONARY UNIVERSE MEDELS AND COSMIC STRING THEORIES Ph.D. Thesis
Jong Hyun Kung 1992 137 p
Avail: Univ. Microfilms Order No. DA9308837

Few selected topics in the inflationary universe models and the cosmic string theories are studied. After the advent of inflationary universe models, questions were raised about the initial conditions of the scalar field which is necessary to give rise to inflation. At present, there are two viable inflationary models: New Inflation, and Linde's Chaotic Inflation. The time evolutions of single plane wave initial excitations of a real singlet scalar field with the potential V(phi) = lambda(phi)/2(phi(sup 2) - sigma(sup 2))(sup 2) was studied. The initial value of the scalar field energy density was bounded by the planck energy density. It is shown that even within this regime there are regions of the phase space for which the universe will enter into chaotic inflation and new inflation. The issue of the stability of chaotic inflation was also studied. Specifically, the possible interference effects of initially exciting another generic plane wave mode was investigated in addition to the mode which when evolved alone is known to give rise to chaotic inflation. The properties of the spectrum of gravitational radiation that was generated by a network of cosmic strings, which decayed by gravitational radiation in an expanding universe were studied. The network of cosmic strings that were used is an improvement of the network that was used in the literature. The conclusion is that the bounds on the gravitational energy density from the nucleosynthesis, the microwave anisotropy, and the pulsar timings arguments can not yet rule out cosmic string theories with G(sub mu) approximately 10(exp -6). The clustering of hot massive neutrinos by a cosmic string loop as a non-adiabatic perturbation is studied using Zel'dovich approximation in conjunction with the neutrino Jeans length. First, the results for a non-decaying loop using the Zel'dovich approximation are shown to exactly reproduce previous results using the Gilbert equation. Second, the analysis is extended to clustering by a decaying loop. It is shown that the effect of loop decay is to increase the radius and mass of the smallest structures that can be seeded by cosmic strings. In conclusion, with decaying loops, the smallest structures that can form by the present time via direct accretion onto loops have a mass of about M = 2.4 x 10(exp 8) solar mass (gamma/50)(sup 3/4)(G(sub mu)/10(exp -6))(sup 3/2)(v(sup eq)/0.04)(sup 3/4)(h(sup -5/2)) with a turn around radius of about r = 29Kpc(gamma/50)(sup 1/4)(G(sub m u)/10(exp -6))(sup 1/2)(v(sup eq)/0.04)(1/4)(h(sup -3/2)), which is to be compared to the present neutrino jeans mass of M = 2.8 x 10(exp 4) solar mass(v(sup eq)/0.04)(sup 3)(h(sup -7)) and its Jeans length of r = 2.9Kpc(v(sup eq)/0.04)h(sup -3). CO LINES TOWARD NGC 2024 AND OTHER STAR FORMING REGIONS: A CLOSER LOOK AT THE WARM GAS COMPONENT
U. U. Graf (Texas Univ., Austin.), A. Eckart, R. Genzel, A. I. Harris, A. Poglitsch, A. P. G. Russell (Royal Observatory, Edinburgh, Scotland.), and J. Stutzki (Cologne Univ., Germany.) Jun. 1992 56 p Submitted for publication
(MPE-Preprint-223; ETN-93-93935) Copyright Avail: Max-Planck-Inst. fuer Extraterrestrische Physik

Observations of the CO-13 J = 6 to 5 emission from a variety of galactic star forming regions are presented. Sources spanning a luminosity in the range of 1 to 10(exp 6) of the solar luminosity were investigated. The high line intensity confirms the presence of large column densities of warm molecular gas in typical regions of massive star formation. The CO-13/CO-12 J = 6 to 5 intensity ratio is typically much higher than the CO-13/CO-12 abundance ratio. Hence, even the mid-J transitions of the main CO isotope are very optically thick in most sources. The CO-13 6 to 5 emission is found to arise from quiescent gas. Strip maps of selected sources show that the CO-13 6 to 5 emitting gas is confined to narrow zones close to the H-2 regions in these star forming regions. A detailed multiline study of the molecular gas from NGC 2024 is presented. ESA

FOURTH-RANK GRAVITY AND COSMOLOGY
A. L. Marrakchi and V. Tapia Jul. 1992 40 p
(DE92-644722; IC-92/124) Avail: CASI HC A03/MF A01 (US Sales Only)

We consider the consequences of describing the metric properties of space-time through a quartic line element. The associated 'metric' is a fourth-rank tensor G(sub mu(upsilon)lambda(pi)). In order to recover a Riemannian behavior of the geometry, it is necessary to have G(sub mu(upsilon)lambda(pi)) = g (sub (mu(upsilon))g(sub lambda(pi))). We construct a theory for the gravitational field based on the fourth-rank metric G(sub mu(upsilon)lambda(pi)). In the absence of matter, the fourth-rank metric becomes separable and the theory coincides with General Relativity. In the presence of matter, we can maintain Riemmanianicity, but now gravitation couples, as compared to General Relativity, in a different way to matter. We develop a simple cosmological model based on a FRW metric with matter described by a perfect fluid. For the present time, the field equations are compatible with k(sub OBS) = O and Omega(sub OBS) less than 0.18, and they imply p/(rho) less than 0.038 which corresponds to an almost pressureless perfect fluid. Therefore, the flatness problem is solved. However, our approach is valid only for p/(rho) less than 0.236. Therefore, we consider an early universe in which the state equation of matter is p/(rho) = 0.236 rather than p/p = 1/3. There is no violation of causality, no horizon problem, for t greater than t(sub CLAS) approximately = 10(exp 20)t(sub PLANCK) approximately = 10(exp -23)s. Our final and most important result is the fact that the entropy is an increasing function of time. When interpreted at the light of General Relativity, the treatment is shown to be almost equivalent to that of the standard model of cosmology combined with the inflationary scenario. DOE

COMPENSATING FIELDS AND ANOMALIES IN SUPERGRAVITY
Y. Shamir Jul. 1992 24 p
(DE92-644724; IC-92/131) Avail: CASI HC A03/MF A01 (US Sales Only)

We discuss the quantization of theories which are formulated using compensating fields. In particular, we discuss the relation between the components formulation and the superspace formulation of supergravity theories. The requirement that the compensating field can be eliminated at the quantum level gives rise to on-shell constraints on the operators of the theory. In some cases, the constraints turn out to be physically unacceptable. Using these considerations, we show that new minimal supergravity is in general anomalous. DOE

FOURTH-RANK COSMOLOGY
A. E. L. Marrakchi and V. Tapia May 1992 27 p
(DE92-641346; IC-92/86) Avail: CASI HC A03/MF A01 (US Sales Only)

Some cosmological implications of the recently proposed fourth-rank theory of gravitation are studied. The model exhibits the possibility of being free from the horizon and flatness problems at the price of introducing a negative pressure. The field equations obtained are compatible with k(sub obs)=0 and Omega(sub obs) is less than 0.18 for our present day universe; they imply -p/rho is less than 0.055 which corresponds to an almost pressureless perfect fluid. Furthermore, there is no horizon problem for t is greater than t(sub clas) approximately 10(exp 20)t(sub Planck) approximately 10(exp -23)s. When interpreted at the light of General Relativity the treatment is shown to be almost equivalent to that of the standard model of cosmology combined with the inflationary scenario. Hence, an interpretation of the negative pressure hypothesis is provided. DOE

EFFECTS OF SPIRAL SHOCKS ON DISK EMISSION LINES
S. K. Chakrabarti and P. J. Wiita (Georgia State Univ., Atlanta.) May 1992 8 p
(DE92-641716; IC-92/82) Avail: CASI HC A02/MF A01 (US Sales Only)

We show that spiral shocks on stellar disks, induced by binary companions, can have significant effects upon observable emission lines. For an even number of shocks, the separations and heights of the two-horned emission lines will vary with binary phase, while for an odd number of shocks, red/blue asymmetries appear, with the red and the blue components alternating in brightness. This meeting was conceived in response to new challenges facing NASA's robotic solar system exploration program. This volume contains papers presented at the Workshop on Advanced Technologies for Planetary Instruments on 28-30 Apr. 1993. This meeting was conceived in response to new challenges facing NASA's robotic solar system exploration program. Over the past several years, SDIO has sponsored a significant technology development program aimed, in part, at the production of instruments with these characteristics. This workshop provided an opportunity for specialists from the planetary science and DoD communities to establish contacts, to explore common technical ground in an open forum, and more specifically, to discuss the applicability of SDIO's technology base to planetary science instruments. For individual titles, see N93-28765 through N93-28829.

A MICROSEISMOMETER FOR TERRESTRIAL AND EXTRATERRESTRIAL APPLICATIONS Abstract Only c35
W. Banerdt, W. Kaiser, and T. VanZandt *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 1 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The scientific and technical requirements of extraterrestrial seismology place severe demands on instrumentation. Performance in terms of sensitivity, stability, and frequency band must match that of the best terrestrial instruments, at a fraction of the size, mass, and power. In addition, this performance must be realized without operator intervention in harsh temperature, shock, and radiation environments. These constraints have forced us to examine some fundamental limits of accelerometer design in order to produce a small, rugged, sensitive seismometer. Silicon micromachined sensor technology offers techniques for the fabrication of monolithic, robust, compact, low-power and -mass accelerometers. However, currently available sensors offer inadequate sensitivity and bandwidth. Our implementation of an advanced silicon micro machined seismometer is based on principles developed at JPL for high-sensitivity position sensor technology. The use of silicon micro machining technology with these new principles should enable the fabrication of a 10(exp -11) g sensitivity seismometer with a bandwidth of at least 0.01 to 20 Hz. The low Q properties of pure single-crystal silicon are essential in order to minimize the Brownian thermal noise limitations generally characteristic of seismometers with small proof masses. A seismometer consists of a spring-supported proof mass and a transducer for measuring its motion. For long period motion a position sensor is generally used, for which the displacement is proportional to the ground acceleration. The mechanical sensitivity can be increased either by increasing the proof mass or decreasing the spring stiffness, neither of which is desirable for planetary applications. Our approach has been to use an ultra sensitive capacitive position sensor with a sensitivity of better than 10(exp -13) m/Hz(exp 1/2). This allows the use of a stiffer suspension and a smaller proof mass. We have built several prototypes using these principles, and tests show that these devices can exhibit performance comparable to state-of-the-art instruments.

THE HYDICE INSTRUMENT DESIGN AND ITS APPLICATION TO PLANETARY INSTRUMENTS Abstract Only c35
R. Basedow, P. Silverglate, W. Rappoport, R. Rockwell, D. Rosenberg, K. Shu, R. Whittlesey, and E. Zalewski *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 1 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The Hyperspectral Digital Imagery Collection Experiment (HYDICE) instrument represents a significant advance in the state of the art in hyperspectral sensors. It combines a higher signal-to-noise ratio (SNR) and significantly better spatial and spectral resolution and radio metric accuracy than systems flying on aircraft today. The need for 'clean' data, i.e., data free of sampling artifacts and excessive spatial or spectral noise, is a key driver behind the difficult combination of performance requirements laid out for HYDICE. Most of these involve the sensor optics and detector. This paper presents an optimized approach to those requirements, one that comprises push broom scanning, a single, mechanically cooled focal plane, a double-pass prism spectrometer, and an easily fabricated yet wide-field telescope. Central to the approach is a detector array that covers the entire spectrum from 0.4 to 2.5 microns. Among the major benefits conferred by such a design are optical and mechanical simplicity, low polarization sensitivity, and coverage of the entire spectrum without suffering the spectral gaps caused by beam splitters. The overall system minimizes interfaces to the C-141 aircraft on which it will be flown, can be calibrated on the ground and in flight to accuracies better than those required, and is designed for simple, push-button operation. Only unprocessed data are recorded during flight. A ground data processing station provides quick-look, calibration correction, and archiving capabilities, with a throughput better than the requirements. Overall performance of the system is expected to provide the solid database required to evaluate the potential of hyperspectral imagery in a wide variety of applications. HYDICE can be regarded as a test bed for future planetary instruments. The ability to spectrally image a wide field of view over multiple spectral octaves offers obvious advantages and is expected to maximize science return for the required cost and weight.

RUGGED, NO-MOVING-PARTS WINDSPEED AND STATIC PRESSURE PROBE DESIGNS FOR MEASUREMENTS IN PLANETARY ATMOSPHERES Abstract Only c35
A. J. Bedard, Jr. and R. T. Nishiyama (Colorado Univ., Boulder.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 1-2 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Instruments developed for making meteorological observations under adverse conditions on Earth can be applied to systems designed for other planetary atmospheres. Specifically, a wind sensor developed for making measurements within tornados is capable of detecting induced pressure differences proportional to wind speed. Adding strain gauges to the sensor would provide wind direction. The device can be constructed in a rugged form for measuring high wind speeds in the presence of blowing dust that would clog bearings and plug passages of conventional wind speed sensors. Sensing static pressure in the lower boundary layer required development of an omnidirectional, tilt-insensitive static pressure probe. The probe provides pressure inputs to a sensor with minimum error and is inherently weather-protected. The wind sensor and static pressure probes have been used in a variety of field programs and can be adapted for use in different planetary atmospheres.

One potential use for neutral particle beam (NPB) technology is as an active orbital probe to investigate the composition of selected locations on the lunar surface. Because the beam is narrow and can be precisely directed, the NPB probe offers possibilities for high resolution experiments that cannot be accomplished using passive techniques. Rather, the combination of both passive and active techniques can be used to provide both full-coverage mapping (passively) at low resolution (tens of kilometers) and high-resolution information for discrete locations of special interest. A preliminary study of NPB applicability for this dual-use application was recently conducted. The study was completed in Feb. 1993. A novel feature was the consideration of the use of a Russian launch vehicle (e.g., the Proton). The use of other Russian space hardware and capabilities was also encouraged. This paper describes the lunar prospector system design. Other researchers discuss the issues and opportunities involving lunar scientific experimentation using an NPB. The NPB lunar prospector utilizes a modified design of the Far Field Optics Experiment (FOX). Like the Earth-orbiting FOX, the core capability of the NPB lunar prospector will be a pulsed RF LINAC that produces a 5-MeV proton beam that is projected to the target with a 30-micro-r beam divergence and a 10-micro-r beam-pointing accuracy. Upon striking the lunar surface, the proton beam will excite characteristic radiation (e.g., X-rays) that can be sensed by one or more detectors on the NPB platform or on a separate detector satellite. LAER-INDUCED BREAKDOWN SPECTROSCOPY INSTRUMENT FOR ELEMENT ANALYSIS OF PLANETARY SURFACES Abstract Only c35
J. Blacic, D. Pettit, D. Cremers, and N. Roessler (McDonnell-Douglas Electronics Co., Saint Louis, MO.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 2-3 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

One of the most fundamental pieces of information about any planetary body is the elemental and mineralogical composition of its surface materials. We are developing an instrument to obtain such data at ranges of up to several hundreds of meters using the technique of Laser-Induced Breakdown Spectroscopy (LIBS). We envision our instrument being used from a spacecraft in close rendezvous with small bodies such as comets and asteroids, or deployed on surface-rover vehicles on large bodies such as Mars and the Moon. The elemental analysis is based on atomic emission spectroscopy of a laser-induced plasma or spark. A pulsed, diode pumped Nd:YAG laser of several hundred millijoules optical energy is used to vaporize and electronically excite the constituent elements of a rock surface remotely located from the laser. Light emitted from the excited plasma is collected and introduced to the entrance slit of a small grating spectrometer. The spectrally dispersed spark light is detected with either a linear photo diode array or area CCD array. When the latter detector is used, the optical and spectrometer components of the LIBS instrument can also be used in a passive imaging mode to collect and integrate reflected sunlight from the same rock surface. Absorption spectral analysis of this reflected light gives mineralogical information that provides a remote geochemical characterization of the rock surface. We performed laboratory calibrations in air and in vacuum on standard rock powders to quantify the LIBS analysis. We performed preliminary field tests using commercially available components to demonstrate remote LIBS analysis of terrestrial rock surfaces at ranges of over 25 m, and we have demonstrated compatibility with a six-wheeled Russian robotic rover vehicle. Based on these results, we believe that all major and most minor elements expected on planetary surfaces can be measured with absolute accuracy of 10-15 percent and much higher relative accuracy. We have performed preliminary systems analysis of a LIBS instrument to evaluate probable mass and power requirements; results of this analysis are summarized. Author (revised)

CLEMENTINE 2: A DOUBLE ASTEROID FLYBY AND IMPACTOR MISSION Abstract Only c12
R. J. Boain *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 3 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Recently JPL was asked by SDIO to analyze and develop a preliminary design for a deep-space mission to fly by two near-Earth asteroids, Eros and Toutatis. As a part of this mission, JPL was also asked to assess the feasibility of deploying a probe on approach to impact Toutatis. This mission is a candidate for SDIO's Clementine 2. SDIO's motivations were to provide further demonstrations of precision, autonomous navigation for controlling the flight paths of both a spacecraft and a probe. NASA's interest in this mission is driven by the opportunity to obtain the first close-up images and other scientific measurements from a spacecraft of two important near-Earth objects. For Toutatis this is especially important since it was observed and imaged extensively just last Dec. using Earth-based radar; Clementine 2 will provide the opportunity to corroborate the radar data and validate the ultimate potential of the radar technique. Scientifically, the probe impact at Toutatis will allow the acquisition of data pertaining to the dynamic strength of surface material and data on the properties of the regolith and on stratification below the surface, and will potentially allow the measurement of thermal diffusivity between the interior and the surface. These determinations will be accomplished by means of high-resolution imagery of the impact crater and its surroundings in visible, ultraviolet, and infrared wave bands from the spacecraft flying by some 30 min. after the probe strike. In addition, if the spacecraft can be equipped with a lightweight mass spectrometer and dust analyzer, the potential also exists to measure the particle sizes and distribution and the composition of the eject a cloud. This mission is planned to be launched in Jul. 1995, with the Eros encounter on 13 Mar. 1996, and the Toutatis flyby on 4 Oct. 1996, some 440 days after launch. Author (revised)

We describe recent technology developments aimed at large CCD imagers for space based applications in the visible and UV. Some of the principal areas of effort include work on reducing device degradation in the natural space-radiation environment, improvements in quantum efficiency in the visible and UV, and larger-device formats. One of the most serious hazards for space based CCD's operating at low signal levels is the displacement damage resulting from bombardment by energetic protons. Such damage degrades charge-transfer efficiency and increases dark current. We have achieved improved hardness to proton-induced displacement damage by selective ion implants into the CCD channel and by reduced temperature of operation. To attain high quantum efficiency across the visible and UV we have developed a technology for back-illuminated CCD's. With suitable antireflection (AR) coatings such devices have quantum efficiencies near 90 percent in the 500-700-nm band. In the UV band from 200 to 400 nm, where it is difficult to find coatings that are sufficiently transparent and can provide good matching to the high refractive index of silicon, we have been able to substantially increase the quantum efficiency using a thin film of HfO2 as an AR coating. These technology efforts were applied to a 420 x 420-pixel frame-transfer imager, and future work will be extended to a 1024 x 1024-pixel device now under development. Author (revised)

EVERY GOOD VIRTUE YOU EVER WANTED IN A Q-SWITCHED SOLID-STATE LASER AND MORE: MONOLITHIC, DIODE-PUMPED, SELF-Q-SWITCHED, HIGHLY REPRODUCIBLE, DIFFRACTION-LIMITED Nd:YAG LASER Abstract Only c36
Y. C. Chen and K. K. Lee (Colorado Univ., Colorado Springs.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 4 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The applications of Q-switched lasers are well known, for example, laser radar, laser remote sensing, satellite orbit determination, Moon orbit and 'moon quake' determination, satellite laser communication, and many nonlinear optics applications. Most of the applications require additional properties of the Q-switched lasers, such as single-axial and/or single-transverse mode, high repetition rate, stable pulse shape and pulse width, or ultra compact and rugged oscillators. Furthermore, space based and airborne lasers for lidar and laser communication applications require efficient, compact, lightweight, long-lived, and stable-pulsed laser sources. Diode-pumped solid-state lasers (DPSSL) have recently shown the potential for satisfying all of these requirements. We will report on the operating characteristics of a diode-pumped, monolithic, self-Q-switched Cr,Nd:YAG laser where the chromium ions act as a saturable absorber for the laser emission at 1064 nm. The pulse duration is 3.5 ns and the output is highly polarized with an extinction ratio of 700:1. It is further shown that the output is single-longitudinal-mode with transform-limited spectral line width without pulse-to-pulse mode competition. Consequently, the pulse-to-pulse intensity fluctuation is less than the instrument resolution of 0.25 percent. This self-stabilization mechanism is because the lasing mode bleaches the distributed absorber and establishes a gain-loss grating similar to that used in the distributed feedback semiconductor lasers. A repetition rate above 5 KHz has also been demonstrated. For higher power, this laser can be used for injection seeding an amplifier (or amplifier chain) or injection locking of a power oscillator pumped by diode lasers. We will discuss some research directions on the master oscillator for higher output energy per pulse as well as how to scale the output power of the diode-pumped amplifier(s) to multi-kilowatt average power.

PLANETARY AND SATELLITE X RAY SPECTROSCOPY: A NEW WINDOW ON SOLID-BODY COMPOSITION BY REMOTE SENSING Abstract Only

D. L. Chenette, R. W. Wolcott, and R. S. Selesnick (California Inst. of Tech., Pasadena.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 4 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

The rings and most of the satellites of the outer planets orbit within the radiation belts of their parent bodies. This is an environment with intense fluxes of energetic electrons. As a result, these objects are strong emitters of X-rays. The characteristic X-ray lines from these bodies depend on atomic composition, but they are not sensitive to how the material is arranged in compounds or mixtures. X-ray fluorescence spectral analysis has demonstrated its unique value in the laboratory as a qualitative and quantitative analysis tool. This technique has yet to be fully exploited in a planetary instrument for remote sensing. The characteristic X-ray emissions provide atomic relative abundances. These results are complementary to the molecular composition information obtained from IR, visible, and UV emission spectra. The atomic relative abundances are crucial to understanding the formation and evolution of these bodies. They are also crucial to the proper interpretation of the molecular composition results from the other sensors. The intensities of the characteristic X-ray emissions are sufficiently strong to be measured with an instrument of modest size. Recent developments in X-ray detector technologies and electronic miniaturization have made possible space-flight X-ray imaging and nonimaging spectrometers of high sensitivity and excellent energy resolution that are rugged enough to survive long-duration space missions. Depending on the application, such instruments are capable of resolving elemental abundances of elements from carbon through iron. At the same time, by measuring the bremsstrahlung intensity and energy spectrum, the characteristics of the source electron flux can be determined. We will discuss these concepts, including estimated source strengths, and will describe a small instrument capable of providing this unique channel of information for future planetary missions. We propose to build this instrument using innovative electronics packaging methods to minimize size and weight. Author (revised)

POLARIMETRIC MULTISPECTRAL IMAGING TECHNOLOGY Abstract Only c35

L.-J. Cheng, T.-H. Chao, M. Dowdy, C. Mahoney, and G. Reyes *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 4-5 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

The Jet Propulsion Laboratory is developing a remote sensing technology on which a new generation of compact, lightweight, high-resolution, low-power, reliable, versatile, programmable scientific polarimetric multispectral imaging instruments can be built to meet the challenge of future planetary exploration missions. The instrument is based on the fast programmable acousto-optic tunable filter (AOTF) of tellurium dioxide (TeO2) that operates in the wavelength range of 0.4-5 microns. Basically, the AOTF multispectral imaging instrument measures incoming light intensity as a function of spatial coordinates, wavelength, and polarization. Its operation can be in either sequential, random access, or multiwavelength mode as required. This provides observation flexibility, allowing real-time alternation among desired observations, collecting needed data only, minimizing data transmission, and permitting implementation of new experiments. These will result in optimization of the mission performance with minimal resources. Recently we completed a polarimetric multispectral imaging prototype instrument and performed outdoor field experiments for evaluating application potentials of the technology. We also investigated potential improvements on AOTF performance to strengthen technology readiness for applications. This paper will give a status report on the technology and a prospect toward future planetary exploration.

A REMOTE LASER-MASS SPECTROMETER FOR DETERMINATION OF ELEMENTAL COMPOSITION Abstract Only c35

R. J. DeYoung and W. Situ (Hampton Univ., VA.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 5-6 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Determination of the elemental composition of lunar, asteroid, and planetary surfaces is a major concern for science and resource utilization of space. The science associated with the development of a satellite or lunar rover laser-mass spectrometer instrument is presented here. The instrument would include a pulsed laser with sufficient energy to create a plasma on a remote surface. Ions ejected from this plasma travel back to the spacecraft or rover, where they are analyzed by a time-of-flight mass spectrometer, giving the elemental and isotope composition. This concept is based on the LIMA-D instrument on board the former Soviet Union Phobos-88 spacecraft sent to Mars. A laser-mass spectrometer placed on a rover or satellite would substantially improve the data return over alternative techniques. The spatial resolution would be centimeters, and a complete mass spectrum could be achieved in one laser shot. An experiment is described that demonstrates these features. A 400 mj Nd:YAG laser is focused, to an intensity of 10(exp 11) w/sq cm, onto a Al, Ag, Cu, Ge, or lunar simulant target. A plasma forms from which ions are ejected. Some of these ions travel down an 18-m evacuated flight tube to a microchannel plate detector. Alternatively, the ions are captured by an ion trap where they are stored until pulsed into a 1-m time-of-flight mass spectrometer, giving the elemental composition of the remote surface. A television camera monitors the plasma plume shape, and a photodiode monitors the temporal plasma emission . With this system, ions of Al, Ag, Cu, Ge, and lunar simulant have been detected at 18 m. The mass spectrum from the ion trap and 1-m time-of-flight tube will be presented. Author (revised)

THE APX SPECTROMETER FOR MARTIAN MISSIONS Abstract Only c35

T. Economou *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 6-7 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Obtaining the chemical composition of any planetary body should be a prime science objective of each planetary mission. The APX spectrometer has been designed to provide a detailed and complete chemical composition of all major (except H) and minor elements with high accuracy, in situ and remotely. From such complete analyses a first-order mineralogy of analyzed samples can be deduced. Laboratory studies in the past have shown that rock types (e.g., dunites, basalts, Philippinate 300 sample) were a uniquely in blind test analyses. Such identification is more accurate than can be obtained from any other remote spectroscopic technique. The APX technique is based on three modes of nuclear and atomic interactions of alpha particles with matter resulting in three different energy spectra containing the compositional information. The instrument uses 50 to 100 mCi of Cm-242 or Cm-244 transuranium radioisotopes to provide a monoenergetic beam of alpha particles (6.01 MeV and 5.80 MeV respectively) and solid-state detectors for acquiring the energy spectra. INVESTIGATION OF MARS ROTATIONAL DYNAMICS USING EARTH-BASED RADIO TRACKING OF MARS LANDERS Abstract Only
C. D. Edwards, Jr., W. M. Folkner, R. D. Kahn, and R. A. Preston *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 7 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The development of space geodetic techniques over the past two decades has made it possible to measure the rotational dynamics of the Earth at the milliarcsecond level, improving our geophysical models of the Earth 's interior and the interactions between the solid Earth and its atmosphere. We have found that the rotational dynamics of Mars can be determined to nearly the same level of accuracy by acquiring Earth-based two-way radio tracking observations of three or more landers globally distributed on the surface of Mars. Our results indicate that the precession and long-term obliquity changes of the Mars pole direction can be determined to an angular accuracy corresponding to about 15 cm/yr at the planet's surface. In addition, periodic nutations of the pole and seasonal variations in the spin rate of the planet can be determined to 10 cm or less. Measuring the rotation of Mars at this accuracy would greatly improve the determination of the planet' s moment of inertia and would resolve the size of a planetary fluid core, providing a valuable constraint on Mars interior models. Detecting seasonal variations in the spin rate of Mars would provide global constraints on atmospheric angular momentum changes due to sublimation of the Mars CO2 polar ice caps. Finally, observation of quasisecular changes in Mars obliquity would have significant implications for understanding long-term climatic change. The key to achieving these accuracies is a globally distributed network of Mars landers with stable, phase-coherent radio transponders. By simultaneously acquiring coherent two-way carrier phase observations between a single Earth tracking station and multiple Mars landers, Earth media errors are essentially eliminated, providing an extremely sensitive measure of changes in the differential path lengths between the Earth tracking station and the Mars landers due to Mars rotation. Time variability of the instrumental phase delay through the radio transponder may represent the limiting error source for this technique. Calibration of the transponder stability to about 0.1 ns or less, over a single tracking arc of up to 12 hr, is sufficient to provide the decimeter-level determination of Mars orientation parameters quoted above. We will provide a detailed description of the multilander tracking technique and the requirements it imposes on both the lander radio system and the Earth-based ground-tracking system. This concept is currently part of the strawman science plan for the Mars Environmental Survey (MESUR) mission and complements many of the other MESUR science goals.

CLEMENTINE SENSOR PROCESSING SYSTEM Abstract Only c19
A. A. Feldstein *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 7-8 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The design of the DSPSE Satellite Controller (DSC) is baselined as a single-string satellite controller. The DSC performs two main functions: health and maintenance of the spacecraft; and image capture, storage, and playback. The DSC contains two processors: a radiation-hardened Mil-Std-1750, and a commercial R3000. The Mil-Std-1750 processor performs all housekeeping operations, while the R3000 is mainly used to perform the image processing functions associated with the navigation functions, as well as performing various experiments. The DSC also contains a data handling unit (DHU) used to interface to various spacecraft imaging sensors and to capture, compress, and store selected images onto the solid-state data recorder. The development of the DSC evolved from several key requirements; the DSPSE satellite was to do the following: (1) have a radiation-hardened spacecraft control system and be immune to single-event upsets (SEU's); (2) use an R3000-based processor to run the star tracker software that was developed by SDIO (due to schedule and cost constraints, there was no time to port the software to a radiation-hardened processor); and (3) fly a commercial processor to verify its suitability for use in a space environment. In order to enhance the DSC reliability, the system was designed with multiple processing paths. These multiple processing paths provide for greater tolerance to various component failures. The DSC was designed so that all housekeeping processing functions are performed by either the Mil-Std-1750 processor or the R3000 processor. The image capture and storage is performed either by the DHU or the R3000 processor. Author (revised)

DESIGN CONCEPT FOR AN IR MAPPING SPECTROMETER FOR THE PLUTO FAST FLYBY MISSION Abstract Only c19
U. Fink, F. Low, B. Hubbard, M. Rieke, G. Rieke, M. Mumma, S. Nozette, G. Neukum, H. Hamel, and M. DiSanti et al *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 8 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The design of an IR mapping spectrometer that exceeds all the criteria of the Pluto Fast Flyby Mission will be presented. The instrument has a mass of approximately 1700 g and uses less than 4 W of power. The design concept is based on an f/3 spectrograph using an aberration-corrected concave holographic grating. Up to four spectral regions can be covered simultaneously by dividing the grating into two to four sections, each imaging the entrance slit on a different area of the array. The spectrography will be fed by a lightweight 5 in. f/3 telescope based on SDIO precepts. In order to provide spectroscopic access to the fundamental molecule frequencies, an extended-range NICMOS array to approximately 3.5 microns and an InSb array going to 5.8 microns will be considered. MULTIBEAM LASER ALTIMETER FOR PLANETARY TOPOGRAPHIC MAPPING Abastract Only c36
J. B. Garvin, J. L. Bufton, and D. J. Harding *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 8 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Laser altimetry provides an active, high-resolution, high-accuracy method for measurement of planetary and asteroid surface topography. The basis of the measurement is the timing of the roundtrip propagation of short-duration pulses of laser radiation between a spacecraft and the surface. Vertical, or elevation, resolution of the altimetry measurement is determined primarily by laser pulse width, surface-induced spreading in time of the reflected pulse, and the timing precision of the altimeter electronics. With conventional gain-switched pulses from solid-state lasers and nanosecond resolution timing electronics, submeter vertical range resolution is possible anywhere from orbital altitudes of approximately 1 km to altitudes of several hundred kilometers. Horizontal resolution is a function of laser beam footprint size at the surface and the spacing between successive laser pulses. Laser divergence angle and altimeter platform height above the surface determine the laser footprint size at the surface, while laser pulse repetition rate, laser transmitter beam configuration, and altimeter platform velocity determine the spacing between successive laser pulses. Multiple laser transmitters in a single laser altimeter instrument that is orbiting above a planetary or asteroid surface could provide across-track as well as along-track coverage that can be used to construct a range image (i.e., topographic map) of the surface. We are developing a pushbroom laser altimeter instrument concept that utilizes a linear array of laser transmitters to provide contiguous across-track and along-track data. The laser technology is based on the emerging monolithic combination of individual, 1-sq cm diode-pumped Nd:YAG laser pulse emitters. Details of the multi-emitter laser transmitter technology, the instrument configuration, and performance calculations for a realistic Discovery-class mission will be presented. Author (revised)

ACOUSTO-OPTIC INFRARED SPECTRAL IMAGER FOR PLUTO FAST FLYBY Abstract Only **c19**

D. A. Glenar and J. J. Hillman *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 8-9 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Acousto-optic tunable filters (AOTF's) enable the design of compact, two-dimensional imaging spectrometers with high spectral and spatial resolution and with no moving parts. Tellurium dioxide AOTF's operate from about 400 nm to nearly 5 microns, and a single device will tune continuously over one octave by changing the RF acoustic frequency applied to the device. An infrared (1.2-2.5 micron) Acousto-Optic Imaging Spectrometer (AImS) was designed that closely conforms to the surface composition mapping objectives of the Pluto Fast Flyby. It features a 75-cm focal length telescope, infrared AOTF, and 256 x 256 NICMOS-3 focal plane array for acquiring narrowband images with a spectral resolving power (lambda/delta(lambda)) exceeding 250. We summarize the instrument design features and its expected performance at the Pluto-Charon encounter. Author (revised)

THERMAL ANALYZER FOR PLANETARY SOIL (TAPS): AN IN SITU INSTRUMENT FOR MINERAL AND VOLATILE-ELEMENT MEASUREMENTS Abstract Only

J. L. Gooding, D. W. Ming, J. E. Gruener (Lockheed Engineering and Sciences Co., Houston, TX.), F. L. Gibbons (Lockheed Engineering and Sciences Co., Houston, TX.), and J. H. Allton (Lockheed Engineering and Sciences Co., Houston, TX.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 9 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Thermal Analyzer for Planetary Soil (TAPS) offers a specific implementation for the generic thermal analyzer/evolved-gas analyzer (TA/EGA) function included in the Mars Environmental Survey (MESUR) strawman payload; applications to asteroids and comets are also possible. The baseline TAPS is a single-sample differential scanning calorimeter (DSC), backed by a capacitive-polymer humidity sensor, with an integrated sampling mechanism. After placement on a planetary surface, TAPS acquires 10-50 mg of soil or sediment and heats the sample from ambient temperature to 1000-1300 K. During heating, DSC data are taken for the solid and evolved gases are swept past the water sensor. Through ground based data analysis, multicomponent DSC data are deconvolved and correlated with the water release profile to quantitatively determine the types and relative proportions of volatile-bearing minerals such as clays and other hydrates, carbonates, and nitrates. The rapid-response humidity sensors also achieve quantitative analysis of total water. After conclusion of soil-analysis operations, the humidity sensors become available for meteorology. The baseline design fits within a circular-cylindrical volume less than 1000 cm(sup 3), occupies 1.2 kg mass, and consumes about 2 Whr of power per analysis. Enhanced designs would acquire and analyze multiple samples and employ additional microchemical sensors for analysis of CO2, SO2, NO(x), and other gaseous species. Atmospheric pumps are also being considered as alternatives to pressurized purge gas. Author (revised)

IMAGING SPECTROMETERS USING CONCAVE HOLOGRAPHIC GRATINGS Abstract Only **c35**

J. Gradie and S. Wang (SETS Technology, Inc., Mililani, HI.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 9-10 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Imaging spectroscopy combines the spatial attributes of imaging with the compositionally diagnostic attributes of spectroscopy. For spacebased remote sensing applications, mass, size, power, data rate, and application constrain the scanning approach. For the first three approaches, substantial savings in mass and size of the spectrometer can be achieved in some cases with a concave holographic grating and careful placement of an order-sorting filter. A hologram etched on the single concave surface contains the equivalent of the collimating, dispersing, and camera optics of a conventional grating spectrometer and provides substantial wavelength dependent corrections for spherical aberrations and a flat focal field. These gratings can be blazed to improve efficiency when used over a small wavelength range or left unblazed for broadband uniform efficiency when used over a wavelength range of up to 2 orders. More than 1 order can be imaged along the dispersion axis by placing an appropriately designed step order-sorting filter in front of the one- or two-dimensional detector. This filter can be shaped for additional aberration corrections. The VIRIS imaging spectrometer based on the broadband design provides simultaneous imaging of the entrance slit from lambda = 0.9 to 2.6 microns (1.5 orders) onto a 128 x 128 HgCdTe detector (at 77 K). The VIRIS spectrometer was used for lunar mapping with the UH 24.in telescope at Mauna Kea Observatory. The design is adaptable for small, low mass, space based imaging spectrometers. THE ULTRAVIOLET PLUME INSTRUMENT (UVPI) Abstract Only **c19**

D. M. Horan *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 1 p (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

The Ultraviolet Plume Instrument (UVPI) was launched aboard the Low-power Atmospheric Compensation Experiment (LACE) satellite on 14 Feb. 1990. Both the spacecraft and the UVPI were sponsored by the Directed Energy Office of the Strategic Defense Initiative Organization. The mission of the UVPI was to obtain radiometrically calibrated images of rocket plumes at high altitude and background image data of the Earth, Earth's limb, and celestial objects in the near- and middle-UV wave bands. The UVPI was designed for nighttime observations, i.e., to acquire and track relatively bright objects against a dark background. Author (revised)

MICROTEXTURED METALS FOR STRAY-LIGHT SUPPRESSION IN THE CLEMENTINE STARTRACKER Abstract Only **c19**

E. A. Johnson *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 10-11 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Anodized blacks for suppressing stray light in optical systems can now be replaced by microscopically textured metal surfaces. An application of these black surfaces to the Clementine star-tracker navigational system, which will be launched in early 1994 to examine the Moon, en route to intercept an asteroid, is detailed. Rugged black surfaces with Lambertian BRDF less than 10(exp -2) srad(sup -1) are critical for suppressing stray light in the star-tracker optical train. Previously available materials spall under launch vibrations to contaminate mirrors and lenses. Microtextured aluminum is nearly as dark, but much less fragile. It is made by differential ion beam sputtering, which generates light-trapping pores and cones slightly smaller than the wavelength to be absorbed. This leaves a sturdy but light-absorbing surface that can survive challenging conditions without generating debris or contaminants. Both seeded ion beams and plasma immersion (from ECR plasmas) extraction can produce these microscopic textures without fragile interfaces. Process parameters control feature size, spacing, and optical effects (THR, BRDF). Both broad and narrow absorption bands can be engineered with tuning for specific wavelengths and applications. Examples are presented characterized by FTIR in reflection librators (0.95 normal emissivity), heat rejection, and enhanced nucleate boiling. Author

NEW TECHNOLOGIES FOR UV DETECTORS Abstract Only **c74**

C. L. Joseph *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 11 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Several technologies are currently being developed, leading to substantial improvements in the performance of UV detectors or significant reductions in power or weight. Four technologies discussed are (1) thin-film coatings to enhance the UV sensitivity of CCD's, (2) highly innovative magnet assemblies that dramatically reduce weight and result in virtually no external flux, (3) new techniques for curving microchannel plates (MCP's) so that single plates can be used to prevent ion feedback and present highly localized charge clouds to an anode structure, and (4) high-performance alternatives to glass-based MCP's. In item (2), for example, very robust magnets are made out of rare earth materials such as samarium cobalt, and cladding magnets are employed to prevent flux from escaping from the detector into the external environment. These new ultralight magnet assemblies are able to create strong, exceptionally uniform magnetic fields for image intensification and focusing of photoelectrons. The principle advantage of such detectors is the quantum efficiencies of 70-80 percent obtained throughout ultraviolet wavelengths (900-2000 A), the highest of any device. Despite the improvements achieved under item (3), high-performance alternatives to conventional glass-based MCP's potentially offer three distinct new advantages that include (1) a 30-100-fold improvement in dynamic range resulting in correspondingly higher signal-to-noise ratios, (2) the use of pure dielectric and semiconductor materials that will not outgas contaminants that eventually destroy photocathodes, and (3) channels that have constant spacing providing long-ranged order since the plates are made using photolithography techniques from the semiconductor industry. The manufacturers of these advanced-technology MCP's, however, are a couple of years away from actually producing a functioning image intensifier. In contrast to the use of CCD's for optical, ground based observations, there is no single detector technology in the ultraviolet that dominates or is as universally suitable for all applications. Thus, several technological problems, recent advances, and the impact that these new enabling technologies represent for UV applications are addressed. Author (revised)

LIGHTWEIGHT MODULAR INSTRUMENTATION FOR PLANETARY APPLICATIONS Abstract Only **c19**
P. B. Joshi *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 11-12 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

An instrumentation, called Space Active Modular Materials ExperimentS (SAMMES), is developed for monitoring the spacecraft environment and for accurately measuring the degradation of space materials in low earth orbit (LEO). The SAMMES architecture concept can be extended to instrumentation for planetary exploration, both on spacecraft and in situ. The operating environment for planetary application will be substantially different, with temperature extremes and harsh solar wind and cosmic ray flux on lunar surfaces and temperature extremes and high winds on venusian and Martian surfaces. Moreover, instruments for surface deployment, which will be packaged in a small lander/rover (as in MESUR, for example), must be extremely compact with ultralow power and weight. With these requirements in mind, the SAMMES concept was extended to a sensor/instrumentation scheme for the lunar and Martian surface environment. Author (revised)

Madison *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 12 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Over the last decade significant advances in technology have made possible development of instruments with substantially improved efficiency in the UV spectral region. In the area of optical coatings and materials, the importance of recent developments in chemical vapor deposited (CVD) silicon carbide (SiC) mirrors, SiC films, and multilayer coatings in the context of ultraviolet instrumentation design are discussed. For example, the development of chemically vapor deposited (CVD) silicon carbide (SiC) mirrors, with high ultraviolet (UV) reflectance and low scatter surfaces, provides the opportunity to extend higher spectral/spatial resolution capability into the 50-nm region. Optical coatings for normal incidence diffraction gratings are particularly important for the evolution of efficient extreme ultraviolet (EUV) spectrographs. SiC films are important for optimizing the spectrograph performance in the 90 nm spectral region. The performance evaluation of the flight optical components for the Solar Ultraviolet Measurements of Emitted Radiation (SUMER) instrument, a spectroscopic instrument to fly aboard the Solar and Heliospheric Observatory (SOHO) mission, designed to study dynamic processes, temperatures, and densities in the plasma of the upper atmosphere of the Sun in the wavelength range from 50 nm to 160 nm, is discussed. The optical components were evaluated for imaging and scatter in the UV. The performance evaluation of SOHO/CDS (Coronal Diagnostic Spectrometer) flight gratings tested for spectral resolution and scatter in the DGEF is reviewed and preliminary results on resolution and scatter testing of Space Telescope Imaging Spectrograph (STIS) technology development diffraction gratings are presented. MULTISCALE MORPHOLOGICAL FILTERING FOR ANALYSIS OF NOISY AND COMPLEX IMAGES Abstract Only **c74**
A. Kher and S. Mitra *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 12-13 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Images acquired with passive sensing techniques suffer from illumination variations and poor local contrasts that create major difficulties in interpretation and identification tasks. On the other hand, images acquired with active sensing techniques based on monochromatic illumination are degraded with speckle noise. Mathematical morphology offers elegant techniques to handle a wide range of image degradation problems. Unlike linear filters, morphological filters do not blur the edges and hence maintain higher image resolution. Their rich mathematical framework facilitates the design and analysis of these filters as well as their hardware implementation. Morphological filters are easier to implement and are more cost effective and efficient than several conventional linear filters. Morphological filters to remove speckle noise while maintaining high resolution and preserving thin image regions that are particularly vulnerable to speckle noise were developed and applied to SAR imagery. These filters used combination of linear (one-dimensional) structuring elements in different (typically four) orientations. Although this approach preserves more details than the simple morphological filters using two-dimensional structuring elements, the limited orientations of one-dimensional elements approximate the fine details of the region boundaries. A more robust filter designed recently overcomes the limitation of the fixed orientations. This filter uses a combination of concave and convex structuring elements. Morphological operators are also useful in extracting features from visible and infrared imagery. A multiresolution image pyramid obtained with successive filtering and a subsampling process aids in the removal of the illumination variations and enhances local contrasts. A morphology-based interpolation scheme was also introduced to reduce intensity discontinuities created in any morphological filtering task. The generality of morphological filtering techniques in extracting information from a wide variety of images obtained with active and passive sensing techniques is discussed. Such techniques are particularly useful in obtaining more information from fusion of complex images by different sensors such as SAR, visible, and infrared. Author (revised)

A UNIQUE PHOTON BOMBARDMENT SYSTEM FOR SPACE APPLICATIONS Abstract Only **c19**
E. J. Klein *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 13 Prepared in cooperation with Sol-RF Energy Systems, Inc., Winnipeg, Manitoba (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The innovative Electromagnetic Radiation Collection and Concentration System (EMRCCS) described is the foundation for the development of a multiplicity of space and terrestrial system formats. The system capability allows its use in the visual, infrared, and ultraviolet ranges of the spectrum for EM collection, concentration, source/receptor tracking, and targeting. The nonimaging modular optical system uses a physically static position aperture for EM radiation collection. Folded optics provide the concentration of the radiation and source autotracking. The collected and concentrated electromagnetic radiation is utilized in many applications, e.g., solar spectrum in thermal and associative photon bombardment applications for hazardous waste management, water purification, metal hardening, hydrogen generation, photovoltaics, etc., in both space and terrestrial segment utilization. Additionally, at the high end of the concentration capability range, i.e., 60,000+, a solar-pulsed laser system is possible. Author (revised)

DETECTION OF OTHER PLANETARY SYSTEMS USING PHOTOMETRY Abstract Only **c89**

D. Koch, W. Borucki, and H. Reitsema (Ball Aerospace Systems Div., Boulder, CO.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 13 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Detection of extrasolar short-period planets, particularly if they are in the liquid-water zone, would be one of the most exciting discoveries of our lifetime. A well-planned space mission has the capability of making this discovery using the photometric method. An Earth-sized planet transiting a Sun-like star will cause a decrease in the apparent luminosity of the star by one part in 10,000 with a duration of about 12 hours and a period of about one year. Given a random orientation of orbital plane alignments with the line-of-sight to a star, and assuming our solar system to be typical, one would expect 1 percent of the stars monitored to exhibit planetary transits. A null result would also be significant and indicate that Earth-sized planets are rare. For the mission to be successful one needs a sensor system that can simultaneously monitor many thousands of stars with a photometric precision of one part in 30,000 per hour of integration. Confirmation of a detection will involve detection of a second transit that will yield a period and predict the time for a third and subsequent transits. The technology issues that need to be addressed are twofold: one is for an appropriate optical design; the other is for a detector system with the necessary photometric precision. Two candidates for the detector system are silicon diodes and CCD's. Author (revised)

AN INTEGRATED XRF/XRD INSTRUMENT FOR MARS EXOBIOLOGY AND GEOLOGY EXPERIMENTS Abstract Only

L. N. Koppel (ARACOR, Sunnyvale, CA.), E. D. Franco (ARACOR, Sunnyvale, CA.), J. A. Kerner (ARACOR, Sunnyvale, CA.), M. L. Fonda, D. E. Schwartz, and J. R. Marshall *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 13-14 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

By employing an integrated x-ray instrument on a future Mars mission, data obtained will greatly augment those returned by Viking; details characterizing the past and present environment on Mars and those relevant to the possibility of the origin and evolution of life will be acquired. A combined x-ray fluorescence/x-ray diffraction (XRF/XRD) instrument was breadboarded and demonstrated to accommodate important exobiology and geology experiment objectives outlined for MESUR and future Mars missions. Among others, primary objectives for the exploration of Mars include the intense study of local areas on Mars to establish the chemical, mineralogical, and petrological character of different components of the surface material; to determine the distribution, abundance, and sources and sinks of volatile materials, including an assessment of the biologic potential, now and during past epoches; and to establish the global chemical and physical characteristics of the Martian surface. The XRF/XRD breadboard instrument identifies and quantifies soil surface elemental, mineralogical, and petrological characteristics and acquires data necessary to address questions on volatile abundance and distribution. Additionally, the breadboard is able to characterize the biogenic element constituents of soil samples providing information on the biologic potential of the Mars environment. Preliminary breadboard experiments confirmed the fundamental instrument design approach and measurement performance. Author (revised)

REMOTE MEASUREMENT OF PLANETARY MAGNETIC FIELDS BY THE HANLE EFFECT

C. K. Kumar, L. Klein, and M. Giraud (Provence Univ., Marseille, France.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 14 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Resonance fluorescence lines in the spectra of planetary atmospheres are polarized. They will be depolarized by magnetic fields in the scattering medium (Hanle effect). The amount of depolarization was calculated for some atomic (FeI, CaI) lines and some molecular lines (NO gamma bands) seen in the Earth's day glow spectra. The results are presented and the potential advantages of LIDAR measurements for obtaining atmospheric magnetic fields are discussed. The depolarization of Na and Ca lines are suitable for measuring magnetic fields in and near Io. Author (revised)

RESOLUTION-ENHANCED MAPPING SPECTROMETER Abstract Only **c35**

J. B. Kumer, J. N. Aubrun, W. J. Rosenberg, and A. E. Roche *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 14 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

A familiar mapping spectrometer implementation utilizes two dimensional detector arrays with spectral dispersion along one direction and spatial along the other. Spectral images are formed by spatially scanning across the scene (i.e., push-broom scanning). For imaging grating and prism spectrometers, the slit is perpendicular to the spatial scan direction. For spectrometers utilizing linearly variable focal-plane-mounted filters the spatial scan direction is perpendicular to the direction of spectral variation. These spectrometers share the common limitation that the number of spectral resolution elements is given by the number of pixels along the spectral (or dispersive) direction. Resolution enhancement by first passing the light input to the spectrometer through a scanned etalon or Michelson is discussed. Thus, while a detector element is scanned through a spatial resolution element of the scene, it is also temporally sampled. The analysis for all the pixels in the dispersive direction is addressed. Several specific examples are discussed. The alternate use of a Michelson for the same enhancement purpose is also discussed. Suitable for weight constrained deep space missions, hardware systems were developed including actuators, sensor, and electronics such that low-resolution etalons with performance required for implementation would weigh less than one pound. PROPOSAL FOR A UNIVERSAL PARTICLE DETECTOR EXPERIMENT Abstract Only **c19**

J. C. Lesho, R. P Cain, and O. M. Uy *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 14-15 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

The Universal Particle Detector Experiment (UPDE), which consists of parallel planes of two diode laser beams of different wavelengths and a large surface metal oxide semiconductor (MOS) impact detector, is proposed. It will be used to perform real-time monitoring of contamination particles and meteoroids impacting the spacecraft surface with high resolution of time, position, direction, and velocity. The UPDE will discriminate between contaminants and meteoroids, and will determine their velocity and size distribution around the spacecraft environment. With two different color diode lasers, the contaminant and meteroid composition will also be determined based on laboratory calibration with different materials. Secondary particles dislodged from the top aluminum surface of the MOS detector will also be measured to determine the kinetic energy losses during energetic meteoroid impacts. The velocity range of this instrument is 0.1 m/s to more than 14 km/s, while its size sensitivity is from 0.2 microns to millimeter-sized particles. The particulate measurements in space of the kind proposed will be the first simultaneous multipurpose particulate experiment that includes velocities from very slow to hypervelocities, sizes from submicrometer- to pellet-sized diameters, chemical analysis of the particulate composition, and measurements of the kinetic energy losses after energetic impacts of meteroids. The experiment will provide contamination particles and orbital debris data that are critically needed for our present understanding of the space environment. The data will also be used to validate contamination and orbital debris models for predicting optimal configuration of future space sensors and for understanding their effects on sensitive surfaces such as mirrors, lenses, paints, and thermal blankets. OPTIMISM EXPERIMENT AND DEVELOPMENT OF SPACE-QUALIFIED SEISMOMETERS IN FRANCE Abstract Only

P. Lognonne and J. F. Karczewski (Laboratoire de Geophysique Externe du CNRS, Saint Maur-des-Fosses, France.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 15 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

The OPTIMISM experiment will put two magnetometers and two seismometers on the Martian floor in 1995, within the framework of the Mars '94 mission. The seismometers are put within the two small surface stations. The seismometer sensitivity will be better than 10 exp -9 g at 1 Hz, 2 orders of magnitude higher than the Viking seismometer sensitivity. A priori waveform modeling for seismic signals on Mars shows that it will be sufficient to detect quakes with a seismic moment greater than 10 exp 15 Nm everywhere on Mars. Such events, according to the hypothesis of a thermoelastic cooling of the Martian lithosphere, are expected to occur at a rate close to one per week and may therefore be observed within the l-year lifetime of the experiment. Other aspects of the experiment are discussed. Author (revised)

FILTERING INTERPOLATORS FOR IMAGE COMPARISON ALGORITHMS Abstract Only c43

R. L. Lucke and A. D. Stocker (Space Computer Corp., Santa Monica, CA.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 15 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Comparing two or more images, either by differencing or ratioing, is important to many remote sensing problems. Because the pixel sample points for the images are (almost) always separated by some nonzero shift, a resampling, or interpolation, process must be performed if one image is to be accurately compared to another. Considered in Fourier space, an interpolator acts as a filter that attenuates some frequencies (usually high) of the image. Thus, when the shifted and unshifted images are compared, the former has been filtered, while the latter has not; the effect of this difference is called interpolation error. The key idea of this paper is to apply a filter to the unshifted image that matches the filtering effect of applying the interpolator to the shifted image, thereby drastically reducing interpolation error. The resulting interpolators, called filtering interpolators, are derived and discussed in detail elsewhere. Basic results will be given in this presentation. Author (revised)

MASS SPECTROMETRIC MEASUREMENT OF MARTIAN KRYPTON AND XENON ISOTOPIC ABUNDANCE Abstract Only

P. Mahaffy and K. Mauersberger (Minnesota Univ., Minneapolis.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 15-16 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

The Viking gas chromatograph mass spectrometer experiment provided significant data on the atmospheric composition at the surface of Mars, including measurements of several isotope ratios. However, the limited dynamic range of this mass spectrometer resulted in marginal measurements for the important Kr and Xe isotopic abundance. The Xe-129 to Xe-132 ratio was measured with an uncertainty of 70%, but none of the other isotope ratios for these species were obtained. Accurate measurement of the Xe and Kr isotopic abundance in this atmosphere provides an important data point in testing theories of planetary formation and atmospheric evolution. The measurement is also essential for a stringent test for the Martian origin of the SNC meteorites, since the Kr and Xe fractionation pattern seen in gas trapped in glassy nodules of an SNC (EETA 79001) is unlike any other known solar system resevoir. Current flight mass spectrometer designs combined with the new technology of a high-performance vacuum pumping system show promise for a substantial increase in gas throughput and the dynamic range required to accurately measure these trace species. Various aspects of this new technology are discussed. Author (revised)

VISIBLE IMAGING ON THE PLUTO FAST FLYBY MISSION Abstract Only

M. C. Malin *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 16 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Objectives for visible imaging of the Pluto-Charon system, as prescribed by the Outer Planets Science Working Group, are to acquire (1) global observations (FOV of approximately 5000 IFOV's) at 1 km/line-pair for the purpose of characterizing surface morphology and geology, (2) global observations in 3-5 broadband colors at 5-10 km/line-pair for studies of surface properties and composition as it relates to morphology, and (3) selected observations at higher spatial resolution for study of surface processes. Several factors of the Pluto Fast Flyby mission make these difficult to achieve. These factors along with other aspects of the mission are discussed. Author (revised)

A DTA/GC FOR THE IN SITU IDENTIFICATION OF THE MARTIAN SURFACE MATERIAL Abstract Only

R. L. Mancinelli, M. R. White, and J. B. Orenberg (San Francisco State Univ., CA.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 16-17 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

The composition and mineralogy of the Martian surface material remain largely unknown. To determine its composition and mineralogy, several techniques are being considered for in situ analyses of the Martian surface material during missions to Mars. We have successfully developed, constructed, and tested a laboratory DTA/GC. The DTA is a Dupont model 1600 high temperature DTA coupled with a GC equipped with a MID detector. The system is operated by a Sun Sparc 11 workstation. When gas evolves during a thermal chemical event, it is shunted into the GC and the temperature is recorded in association with the specific thermal event. We have used this laboratory instrument to define experimental criteria necessary for determining the composition and mineralogy of the Martian surface in situ (e.g., heating of sample to 1100 C to distinguish clays). Our studies indicate that DTA/GC will provide a broad spectrum of mineralogical and evolved gas data pertinent to exobiology, geochemistry, and geology. Author (revised)

ONBOARD SIGNAL PROCESSING: WAVE OF THE FUTURE FOR PLANETARY RADIO SCIENCE? Abstract Only

E. A. Marouf *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 17 (For primary document see N93-28764 11-91)

Avail: CASI HC A01/MF A01

Future spacecraft-based radio observations of planetary surfaces, rings, and atmospheres could significantly benefit from recent technological advances in real-time digital signal processing (DSP) hardware. Traditionally, the radio observations have been carried out in a 'down link' configuration in which about 20-W spacecraft transmitted RF power illuminates the target of interest and the perturbed signal is collected at an Earth receiving station. The down link configuration was dictated by the large throughput of received data, corresponding to a relatively large recording band width (about 50 kHz) needed to capture the coherent and scattered signal components in the presence of trajectory, ephemeris, and measurement uncertainties. An alternative 'up link' configuration in which powerful Earth-based radio transmitters (20-200 kW) are used to illuminate the target and data are recorded on board a spacecraft could enhance the measurements' signal-to-noise ratio by a factor of about 1000, allowing a quantum leap in scientific capabilities. Various aspects of alternative signal processing technologies are discussed. Author (revised)

SPACEBORNE PASSIVE RADIATIVE COOLER Abstract Only c31
S. Mathias *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 17 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Radiative coolers are passive refrigeration devices for satellites and space probes that provide refrigeration for an infrared or other type of detector that operates at cryogenic temperatures. Typically a cooler can supply 20 mW of cooling at about 85 K, and over 500 mW of cooling at about 165 K. The exact cooler temperatures and heat loads are dependent upon the clear field of view of the cooler to space. Some features of the Arthur D. Little passive radiative cooler are given. SYSTEMATIC PROCESSING OF CLEMENTINE DATA FOR SCIENTIFIC ANALYSES Abstract Only c82
A. S. McEwen *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 17-18 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

If fully successful, the Clementine mission will return about 3,000,000 lunar images and more than 5000 images of Geographos. Effective scientific analyses of such large datasets require systematic processing efforts. Concepts for two such efforts are described: glogal multispectral imaging of the moon; and videos of Geographos. Author (revised)

SOURCES SOUGHT FOR INNOVATIVE SCIENTIFIC INSTRUMENTATION FOR SCIENTIFIC LUNAR ROVERS Abstract Only c35
C. Meyer *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 18 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Lunar rovers should be designed as integrated scientific measurement systems that address scientific goals as their main objective. Scientific goals for lunar rovers are presented. Teleoperated robotic field geologists will allow the science team to make discoveries using a wide range of sensory data collected by electronic 'eyes' and sophisticated scientific instrumentation. rovers need to operate in geologically interesting terrain (rock outcrops) and to identify and closely examine interesting rock samples. Enough flight-ready instruments are available to fly on the first mission, but additional instrument development based on emerging technology is desirable. Various instruments that need to be developed for later missions are described. Author (revised)

DRILL/BORESCOPE SYSTEM FOR THE MARS POLAR PATHFINDER Abstract Only
D. A. Paige, S. E. Wood, and A. R. Vasavada *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 18-19 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The primary goals of the Mars Polar Pathfinder (MPP) Discovery Mission are to characterize the composition and structure of Mars' north polar ice cap, and to determine whether a climate record may be preserved in layers of ice and dust. The MPP would land as close as possible to the geographic north pole of Mars and use a set of instruments similar to those used by glaciologists to study polar ice caps on Earth: a radar sounder, a drill/borescope system, and a thermal probe. The drill/borescope system will drill approximately 50 cm into the surface and image the sides of the hole at 10 micron resolution for compositional and stratigraphic analysis. Several uncertainties have guided the development of this instrument, and they are discussed. Author (revised)

HONEYWELL'S COMPACT, WIDE-ANGLE UV-VISIBLE IMAGING SENSOR Abstract Only c74
D. Pledger and J. Billing-Ross (Honeywell, Inc., Glendale, AZ.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 19 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Honeywell is currently developing the Earth Reference Attitude Determination System (ERADS). ERADS determines attitude by imaging the entire Earth's limb and a ring of the adjacent star field in the 2800-3000 A band of the ultraviolet. This is achieved through the use of a highly nonconventional optical system, an intensifier tube, and a mega-element CCD array. The optics image a 30 degree region in the center of the field, and an outer region typically from 128 to 148 degrees, which can be adjusted up to 180 degrees. Because of the design employed, the illumination at the outer edge of the field is only some 15 percent below that at the center, in contrast to the drastic rolloffs encountered in conventional wide-angle sensors. The outer diameter of the sensor is only 3 in; the volume and weight of the entire system, including processor, are 1000 cc and 6 kg, respectively. Author (revised)

INFRARED RUGATES BY MOLECULAR BEAM EPITAXY Abstract Only c74
M. Rona *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 20 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Rugates are optical structures that have a sinusoidal index of refraction (harmonic gradient-index field). As their discrete high/ low index filter counterparts, they can be used as narrow rejection band filters. However, since rugates do not have abrupt interfaces, they tend to have a smaller absorption, hence deliver a higher in band reflectivity. The absence of sharp interfaces makes rugates even more desirable for high-energy narrow band reflectors. In this application, the lack of a sharp interface at the maximum internal standing wave electric field results in higher breakdown strengths. Our method involves fabricating rugates, with molecular beam epitaxy, on GaAs wafers as an Al(x)Ga(1-x)As single-crystal film. Author (revised)

PLASMA, MAGNETIC, AND ELECTROMAGNETIC MEASUREMENTS AT NONMAGNETIC BODIES Abstract Only
C. T. Russell and J. G. Luhmann *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 20 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The need to explore the magnetospheres of the Earth and the giant planets is widely recognized and is an integral part of our planetary exploration program. The equal need to explore the plasma, magnetic, and electromagnetic environments of the nonmagnetic bodies is not so widely appreciated. The previous, albeit incomplete, magnetic and electric field measurements at Venus, Mars, and comets have proven critical to our understanding of their atmospheres and ionospheres in areas ranging from planetary lightning to solar wind scavenging and accretion. In the cases of

Venus and Mars, the ionospheres can provide communication paths over the horizon for low-altitude probes and landers, but we know little about their lower boundaries. The expected varying magnetic fields below these planetary ionospheres penetrates the planetary crusts and can be used to sound the electrical conductivity and the thermal profiles of the interiors. However, we have no knowledge of the levels of such fields, let alone their morphology. Finally, we note that the absence of an atmosphere and an ionosphere does not make an object any less interesting for the purposes of electromagnetic exploration. Even weak remanent magnetism such as that found on the Moon during the Apollo program provides insight into the present and past states of planetary interiors. We have very intriguing data from our space probes during times of both close and distant passages of asteroids that suggest they may have coherent magnetization. If true, this observation will put important constraints on how the asteroids formed and have evolved. Our planetary exploration program must exploit its full range of exploration tools if it is to characterize the bodies of the solar system thoroughly. We should especially take advantage of those techniques that are proven and require low mass, low power, and low telemetry rates to undertake. Author (revised)

A COMPACT IMAGING DETECTOR OF POLARIZATION AND SPECTRAL CONTENT Abstract Only **c74**
D. M. Rust, A. Kumar, and K. E. Thompson *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 20 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

A new type of image detector will simultaneously analyze the polarization of light at all picture elements in a scene. The integrated Dual Imaging Detector (IDID) consists of a polarizing beam splitter bonded to a charge-coupled device (CCD), with signal-analysis circuitry and analog-to-digital converters, all integrated on a silicon chip. The polarizing beam splitter can be either a Ronchi ruling, or an array of cylindrical lenslets, bonded to a birefringent wafer. The wafer, in turn, is bonded to the CCD so that light in the two orthogonal planes of polarization falls on adjacent pairs of pixels. The use of a high-index birefringent material, e.g., rutile, allows the IDID to operate at f-numbers as high as f/3.5. Other aspects of the detector are discussed. Author (revised)

DIGITAL IMAGE COMPRESSION USING ARTIFICIAL NEURAL NETWORKS Abstract Only **c82**
M. Serra-Ricart, L. Garrido (Barcelona Univ., Spain.), V. Gaitan (Barcelona Univ., Spain.), and A. Aloy (Digital Equipment Enterprise Espana S.A., Barcelona, Spain.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 20-21 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The problem of storing, transmitting, and manipulating digital images is considered. Because of the file sizes involved, large amounts of digitized image information are becoming common in modern projects. Our goal is to described an image compression transform coder based on artificial neural networks techniques (NNCTC). A comparison of the compression results obtained from digital astronomical images by the NNCTC and the method used in the compression of the digitized sky survey from the Space Telescope Science Institute based on the H-transform is performed in order to assess the reliability of the NNCTC. PROTOTYPE BACKSCATTER MOESSBAUER SPECTROMETER FOR MEASUREMENT OF MARTIAN SURFACE MINERALOGY Abstract Only
T. D. Shelfer, R. V. Morris, D. G. Agresti (Alabama Univ., Birmingham.), T. Nguyen (Lockheed Engineering and Sciences Co., Houston, TX.), E. L. Wills (Alabama Univ., Birmingham.), and M. H. Shen (Alabama Univ., Birmingham.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 21 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

We have designed and successfully tested a prototype of a backscatter Moessbauer spectrometer (BaMS) targeted for use on the Martian surface to (1) determine oxidation states of iron, and (2) identify and determine relative abundances of iron-bearing mineralogies. No sample preparation is required to perform measurements; it is only necessary to bring sample and instrument into physical contact. The prototype meets our projected specification for a flight instrument in terms of mass, power, and volume. A Moessbauer spectrometer on the Martian surface would provide wide variety of information about the current state of the Martian surface, and this information is described. Author (revised)

SPACECRAFT COMPUTER TECHNOLOGY AT SOUTHWEST RESEARCH INSTITUTE Abstract Only **c60**
D. J. Shirley *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 21 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Southwest Research Institute (SwRI) has developed and delivered spacecraft computers for a number of different near-Earth-orbit spacecraft including shuttle experiments and SDIO free-flyer experiments. We describe the evolution of the basic SwRI spacecraft computer design from those weighing in at 20 to 25 lb and using 20 to 30 W to newer models weighing less than 5 lb and using only about 5 W, yet delivering twice the processing throughput. Because of their reduced size, weight, and power, these newer designs are especially applicable to planetary instrument requirements. The basis of our design evolution has been the availability of more powerful processor chip sets and the development of higher density packaging technology, coupled with more aggressive design strategies in incorporating high-density FPGA technology and use of high-density memory chips. In addition to reductions in size, weight, and power, the newer designs also address the necessity of survival in the harsh radiation environment of space. Spurred by participation in such programs as MSTI, LACE, RME, Delta 181, Delta Star, and RADARSAT, our designs have evolved in response to program demands to be small, low-powered units, radiation tolerant enough to be suitable for both Earth-orbit microsats and for planetary instruments. Present designs already include MIL-STD-1750 and Multi-Chip Module (MCM) technology with near-term plans to include RISC processors and higher-density MCM's. Long term plans include development of whole-core processors on one or two MCM's. Author (revised)

THE BACKGROUNDS DATA CENTER Abstract Only **c82**
W. A. Snyder, H. Gursky, H. M. Heckathorn, R. L. Lucke, S. L. Berg (Computational Physics, Inc., Fairfax, VA.), E. G. Dombrowski (Sachs/Freeman Associates, Inc., Landover, MD.), and R. A. Kessel (Computational Physics, Inc., Fairfax, VA.) *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 21-22 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The Strategic Defense Initiative Organization has created data centers for midcourse, plumes, and backgrounds phenomenologies. The Backgrounds Data Center (BDC) has been designated as the prime archive for data collected by SDIO programs. The BDC maintains a Summary Catalog that contains 'metadata,' that is, information about data, such as when the data were obtained, what the spectral range of the data is, and what region of the Earth or sky was observed. Queries to this catalog result in a listing of all data sets (from all experiments in the Summary Catalog) that satisfy the specified criteria. Thus, the user can identify different experiments that made similar observations and order them from the BDC for analysis. On-site users can use the Science Analysis Facility (SAFE for this purpose. For some programs, the BDC maintains a Program Catalog, which can classify data in as many ways as desired (rather than just by position, time, and spectral range as in the Summary Catalog). For example, data sets could be tagged with such diverse parameters as solar illumination angle, signal level, or the value of a particular spectral ratio, as long as these quantities can be read from the digital record or calculated from it by the ingest program. All unclassified catalogs and unclassified data will be remotely accessible. Author (revised)

THE ENHANCED-MODEL LADAR WIND SENSOR AND ITS APPLICATION IN PLANETARY WIND VELOCITY MEASUREMENTS Abstract Only
D. C. Soreide, R. L. McGann, L. L. Erwin, and D. J. Morris *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 22 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

For several years we have been developing an optical air-speed sensor that has a clear application as a meteorological wind-speed sensor for the Mars landers. This sensor has been developed for aircraft use to replace the familiar, pressure-based Pitot probe. Our approach utilizes a new concept in the laser-based optical measurement of air velocity (the Enhanced-Mode Ladar), which allows us to make velocity measurements with significantly lower laser power than conventional methods. The application of the Enhanced-Mode Ladar to measuring wind speeds in the martian atmosphere is discussed. Author (revised)

THE MESUR MISSION Abstract Only
S. W. Squyres *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 22-23 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The MESUR mission will place a network of small, robust landers on the Martian surface, making a coordinated set of observations for at least one Martian year. MESUR presents some major challenges for development of instruments, instrument deployment systems, and on board data processing techniques. The instrument payload has not yet been selected, but the straw man payload is (1) a three-axis seismometer; (2) a meteorology package that senses pressure, temperature, wind speed and direction, humidity, and sky brightness; (3) an alphaproton-X-ray spectrometer (APXS); (4) a thermal analysis/evolved gas analysis (TA/EGA) instrument; (5) a descent imager, (6) a panoramic surface imager; (7) an atmospheric structure instrument (ASI) that senses pressure, temperature, and acceleration during descent to the surface; and (8) radio science. Because of the large number of landers to be sent (about 16), all these instruments must be very lightweight. All but the descent imager and the ASI must survive landing loads that may approach 100 g. The meteorology package, seismometer, and surface imager must be able to survive on the surface for at least one Martian year. The seismometer requires deployment off the lander body. The panoramic imager and some components of the meteorology package require deployment above the lander body. The APXS must be placed directly against one or more rocks near the lander, prompting consideration of a micro rover for deployment of this instrument. The TA/EGA requires a system to acquire, contain, and heat a soil sample. Both the imagers and, especially, the seismometer will be capable of producing large volumes of data, and will require use of sophisticated data compression techniques. Author (revised)

A LOW-COST, LIGHTWEIGHT, AND MINIATURIZED TIME-OF-FLIGHT MASS SPECTROMETER (TOFMS) Abstract Only **c35**
S. K. Srivastava *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 23 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Time-of-flight mass spectrometers (TOFMS) are commonly used for mass analysis and for the measurement of energy distributions of charged particles. For achieving high mass and energy resolution these instruments generally comprise long flight tubes, often as long as a few meters. This necessitates high voltages and a very clean environment. These requirements make them bulky and heavy. We have developed an instrument and calibration techniques that are based on the design principles of TOFMS. However, instead of one long flight tube it consists of a series of cylindrical electrostatic lenses that confine ions under study along the axis of the flight tube. Author (revised)

PLUTO FAST FLYBY MISSION AND SCIENCE OVERVIEW Abstract Only
A. Stern *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 23 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Planning for the Pluto Fast Flyby (PFF) mission centers on the launch of two small (110-160 kg) spacecraft late in the 1990s on fast, 6-8-year trajectories that do not require Jupiter flybys. The cost target of the two-spaceraft PFF mission is $40.0 million. Scientific payload definition by NASA's Outer Planets Science Working Group (OPSWG) and JPL design studies for the Pluto flyby spacecraft are now being completed, and the program is in Phase A development. Selection of a set of lightweight, low-power instrument demonstrations is planned for May 1993. According to plan, the completion of Phase A and then detailed Phase B spacecraft and payload design work will occur in FY94. The release of an instrument payload AO, followed by the selection of the flight payload, is also scheduled for FY94. Author (revised)

Dudenhoefer (Mechanical Technology, Inc., Latham, NY.) et al *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 23-24 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

Magellan radar data show the surface of Venus to contain a wide range of geologic features (large volcanoes, extensive rift valleys, etc.). Although networks of interconnecting zones of deformation are identified, a system of spreading ridges and subduction zones like those that dominate the tectonic style of the Earth do not appear to be present. In addition, the absence of a mantle low-viscosity zone suggests a strong link between mantle dynamics and the surface. As a natural follow-on to the Magellan mission, establishing a network of seismometers on Venus will provide detailed quantitative information on the large scale interior structure of the planet. When analyzed in conjunction with image, gravity, and topography information, these data will aid in constraining mechanisms that drive surface deformation. Author (revised)

PLASMA DIAGNOSTICS BY ANTENNA IMPEDANCE MEASUREMENTS Abstract Only **c32**
C. M. Swenson, K. D. Baker, E. Pound, and M. D. Jensen *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 24 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The impedance of an electrically short antenna immersed in a plasma provides an excellent in situ diagnostic tool for electron density and other plasma parameters. By electrically short we mean that the wavelength of the free-space electromagnetic wave that would be excited at the driving frequency is much longer than the physical size of the antenna. Probes using this impedance technique have had a long history with sounding rockets and satellites, stretching back to the early 1960s. This active technique could provide information on composition and temperature of plasmas for comet or planetary missions. Advantages of the impedance probe technique are discussed and two classes of instruments built and flown by SDL-USU for determining electron density (the capacitance and plasma frequency probes) are described. LUNAR SCIENCE: USING THE MOON AS A TESTBED Abstract Only
G. J. Taylor *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 24-25 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The Moon is an excellent test bed for innovative instruments and spacecraft. Excellent science can be done, the Moon has a convenient location, and previous measurements have calibrated many parts of it. I summarize these attributes and give some suggestions for the types of future measurements. The Lunar Scout missions planned by NASA's Office of Exploration will not make all the measurements needed. Thus, test missions to the Moon can also return significant scientific results, making them more than technology demonstrations. The Moon is close to Earth, so cruise time is insignificant, tracking is precise, and some operations can be controlled from Earth, but it is in the deep space environment, allowing full tests of instruments and spacecraft components. The existing database on the Moon allows tests of new instruments against known information. The most precise data come from lunar samples, where detailed analyses of samples from a few places on the Moon provide data on chemical and mineralogical composition and physical properties. USE OF PARTICLE BEAMS FOR LUNAR PROSPECTING Abstract Only
A. J. Toepfer, D. Eppler, A. Friedlander, and R. Weitz *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 25 Prepared for Grumman Aerospace Corp., Bethpage, NY (For primary document see N93-28764 11-91)
(Contract DASG60-90-C-0103)
Avail: CASI HC A01/MF A01

A key issue in choosing the appropriate site for a manned lunar base is the availability of resources, particularly oxygen and hydrogen for the production of water, and ores for the production of fuels and building materials. NASA has proposed two Lunar Scout missions that would orbit the Moon and use, among other instruments, a hard X-ray spectrometer, a neutron spectrometer, and a Ge gamma ray spectrometer to map the lunar surface. This passive instrumentation will have low resolution (tens of kilometers) due to the low signal levels produced by natural radioactivity and the interaction of cosmic rays and the solar wind with the lunar surface. This paper presents the results of a concept definition effort for a neutral particle beam lunar mapper probe. The idea of using particle beam probes to survey asteroids was first proposed by Sagdeev et al., and an ion beam device was fielded on the 1988 Soviet probe to the Mars moon Phobos. During the past five years, significant advances in the technology of neutral particle beams (NPB) have led to a suborbital flight of a neutral hydrogen beam device in the SDIO-sponsored BEAR experiment. An orbital experiment, the Neutral Particle Beam Far Field Optics Experiment (NPB-FOX) is presently in the preliminary design phase. The development of NPB accelerators that are space-operable leads one to consider the utility of these devices for probing the surface of the Moon using gamma ray, X-ray, and optical/UV spectroscopy to locate various elements and compounds. We consider the utility of the NPB-FOX satellite containing a 5-MeV particle beam accelerator as a probe in lunar orbit. Irradiation of the lunar surface by the particle beam will induce secondary and back scattered radiation from the lunar surface to be detected by a sensor that may be co-orbital with or on the particle beam satellite platform, or may be in a separate orbit. The secondary radiation is characteristic of the make-up of the lunar surface. The size of the spot irradiated by the beam is less than 1 km wide along the ground track of the satellite, resulting in the potential for high resolution. The fact that the probe could be placed in polar orbit would result in global coverage of the lunar surface. The orbital particle beam probe could provide the basis for selection of sites for more detailed prospecting by surface rovers. Author (revised)

MINIATURE LONG-LIFE SPACE CRYOCOOLERS Abstract Only **c31**
E. Tward *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 26-27 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

TRW has designed, built, and tested a miniature integral Stirling cooler and a miniature pulse tube cooler intended for long-life space application. Both efficient, low-vibration coolers were developed for cooling IR sensors to temperatures as low as 50 K on lightsats. The vibrationally balanced nonwearing design Stirling cooler incorporates clearance seals maintained by flexure springs for both the compressor and the drive displacer. The design achieved its performance goal of 0.25 W at 65 K for an input power to the compressor of 12 W. The cooler recently passed launch vibration tests prior to its entry into an extended life test and its first scheduled flight in 1995. The vibrationally balanced, miniature pulse tube cooler intended for a 10-year long-life space application incorporates a flexure bearing compressor vibrationally balanced by a motor-controlled balancer and a completely passive pulse tube cold head. The Midcourse Space Experiment (MSX) is an SDIO sponsored space based sensor experiment with a full complement of optical sensors. Because of the possible deleterious effect of both molecular and particulate contamination on these sensors, a suite of environmental monitoring instruments are also being flown with the spacecraft. These instruments are the Total Pressure Sensor based on the cold-cathode gauge, a quadrupole mass spectrometer, a Bennett-type ion mass spectrometer, a cryogenic quartz crystal microbalance (QCM), four temperature-controlled QCM's, and a Xenon and Krypton Flash Lamp Experiment. These instruments have been fully space-qualified, are compact and low cost, and are possible candidate sensors for near-term planetary and atmospheric monitoring. The philosophy adopted during design and fabrication, calibration and ground testing, and modeling will be discussed . Author

Wide-field imaging systems equipped with objective prisms or gratings have had a long history of utility in groundbased observations of meteors and comets. Deployment of similar instruments from low Earth orbit would allow the first UV observations of meteors. This instrument can be used for comets and Lyman alpha coronae of Earth-orbit-crossing asteroids. A CaF2 prism imaging spectrograph designed for stellar observations was used aboard Skylab to observe Comet Kohoutek (1973f), but its 1300-A cut-off precluded Lyman alpha images and it was not used for observation of meteors. Because the observation of the UV spectrum of a meteor has never been attempted, researchers are denied the opportunity to obtain composition information from spectra at those wavelengths. We propose construction of a flight instrument functioning in the 1100-3200 A spectral range that is suitable for a dedicated satellite ('Quick Star') or as a space-station-attached payload. It can also be an autonomous package in the space shuttle cargo bay. Author (revised)

DEVELOPMENT OF MINIATURIZED OPTIMIZED SMART SENSORS (MOSS) FOR SPACE PLASMAS Abstract Only c19
D. T. Young *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 27 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The cost of space plasma sensors is high for several reasons: (1) Most are one-of-a-kind and state-of-the-art, (2) the cost of launch to orbit is high, (3) ruggedness and reliability requirements lead to costly development and test programs, and (4) overhead is added by overly elaborate or generalized spacecraft interface requirements. Possible approaches to reducing costs include development of small 'sensors' (defined as including all necessary optics, detectors, and related electronics) that will ultimately lead to cheaper missions by reducing (2), improving (3), and, through work with spacecraft designers, reducing (4). Despite this logical approach, there is no guarantee that smaller sensors are necessarily either better or cheaper. We have previously advocated applying analytical 'quality factors' to plasma sensors (and spacecraft) and have begun to develop miniaturized particle optical systems by applying quantitative optimization criteria. We are currently designing a Miniaturized Optimized Smart Sensor (MOSS) in which miniaturized electronics (e.g., employing new power supply topology and extensive us of gate arrays and hybrid circuits) are fully integrated with newly developed particle optics to give significant savings in volume and mass. The goal of the SwRI MOSS program is development of a fully self-contained and functional plasma sensor weighing 1 lb and requiring 1 W. MOSS will require only a typical spacecraft DC power source (e.g., 30 V) and command/data interfaces in order to be fully functional, and will provide measurement capabilities comparable in most ways to current sensors. X RAY, FAR, AND EXTREME ULTRAVIOLET COATINGS FOR SPACE APPLICATIONS Abstract Only c27
M. Zukic and D. G. Torr *In* Lunar and Planetary Inst., Workshop on Advanced Technologies for Planetary Instruments, Part 1 1993 p 27-28 (For primary document see N93-28764 11-91)
Avail: CASI HC A01/MF A01

The idea of utilizing imaging mirrors as narrow band filters constitutes the basis of the design of extreme ultraviolet imagers operating at 58.4 nm and 83.4 nm. The net throughput of both imaging-filtering systems is better than 20 percent. The superiority of the EUV self-filtering camera/telescope becomes apparent when compared to previously theoretically designed 83.4-nm filtering-imaging systems, which yielded transmissions of less than a few percent and therefore less than 0.1 percent throughput when combined with at least two imaging mirrors. Utilizing the self-filtering approach, instruments with similar performances are possible for imaging at other EUV wavelengths, such as 30.4 nm. The self-filtering concept is extended to the X-ray region where its application can result in the new generation of X-ray telescopes, which could replace current designs based on large and heavy collimators. THE THERMAL STRUCTURE, DUST LOADING, AND MERIDIONAL TRANSPORT IN THE MARTIAN ATMOSPHERE DURING LATE SOUTHERN SUMMER Ph.D. Thesis
Michelle Santee 1993 186 p
Avail: Univ. Microfilms Order No. DA9307049

The thermal structure, dust loading, and meridional transport in the Martian atmosphere are investigated using thermal emission spectra recorded by the Mariner 9 infrared interferometer spectrometer (IRIS). The analysis is restricted to a subset of the IRIS data consisting of approximately 2400 spectra spanning L(sub s) = 343 - 348 deg, corresponding to late southern summer on Mars. Simultaneous retrieval of the vertical distribution of both atmospheric temperature and dust optical depth is accomplished through an iterative procedure which is performed on each spectrum. Although atmospheric temperatures decrease from equator to pole at lower altitudes, both dayside and nightside temperatures above about 0.1 mbar (approximately 40 km) are warmer over the winter (north) polar region than over the equator or the summer (south) polar region. Zonal-mean zonal winds are derived from the atmospheric temperatures assuming gradient wind balance and zero surface zonal wind. Both hemispheres have intense mid-latitude westerly jets (with velocities of 80-90 m/s near 50 km); in the southern tropics the winds are strongly easterly (with velocities of 100 m/s near 50 km). A comprehensive radiative transfer model is used to compute solar heating and thermal cooling rates from the retrieved IRIS temperature and dust distributions. There are large net heating rates (up to 8 K/day) in the equatorial region and large net cooling rates (up to 20 K/day) in the polar regions. These net heating rates are used in a diagnostic stream function model which solves for the meridional and vertical components of the diabatic circulation simultaneously. The results show a vigorous two-cell circulation, with rising motion over the equatorial region (approximately 1.5 cm/s), poleward flow in both hemispheres (approximately 2 m/s), sinking motion over both polar regions (1-2 cm/s), and return flow in the lowest atmospheric levels. The meridional transport time scale is approximately 13 days. Water vapor desorbed from the low-latitude regolith during late northern winter/early northern spring may be transported upward by the ascending branch of this circulation, where it may be advected back to the polar regions by the high-altitude meridional winds. This process could provide a high-altitude source of water vapor for the formation and maintenance of the north polar hood. Dissert. Abstr.

PLANETARY PROTECTION ISSUES FOR THE MESUR MISSION: PROBABILITY OF GROWTH (Pg)
Harold P. Klein, ed. (Santa Clara Univ., CA.) Jul. 1993 129 p Workshop held in Palo Alto, CA, 3-4 Jun. 1991
(RTOP 186-58-01)
(NASA-CP-3167; A-92078; NAS 1.55:3167) Avail: CASI HC A07/MF A02

The purpose of the workshop was to re-evaluate the existing guidelines for the probability of growth of terrestrial organisms on Mars that were established by the National Academy of Sciences following the Viking Mission. A panel of specialists in microbiology and allied fields reviewed this issue in the light of current information about the physical and chemical environments expected on Mars. Their deliberations resulted in the virtually unanimous conclusion that the existing Pg guidelines were either appropriate or that the values for Pg should be further reduced. Individual assessments of this problem by each of the participants, together with those of additional invited experts are included. Author (revised)

SPACECRAFT STUDIES OF PHOBOS AND MARS Final Technical Report, 1 Jun. 1988 - 31 Oct. 1990

Bruce C. Murray 1990 8 p
(Grant NAGw-1426)
(NASA-CR-193298; NAS 1.26:193298) Avail: CASI HC A02/MF A01

Utilizing the Termoskan data set of the Phobos '88 mission we have recognized a new feature on Mars: Ejecta blanket Distinct In the THermal infrared (EDITH). Virtually all of the more than one hundred of these features discovered in the Termoskan data are located on the plains near Valles Manneris. EDITH's have a startlingly clear dependence upon terrains of Hesperian age, implying a spatial or temporal dependence on Hesperian terrains. Almost no thermally distinct ejecta blankets are associated with any of the thousands of craters within the data set that occur on the older Noachian units. EDITH's also do not appear on the portions of the younger Tharsis Amazonian units seen in the data. The Hesperian terrain dependence cannot be explained by either atmospheric or impactor variations; Noachian and Hesperian terrains must have experienced identical atmospheric and impactor conditions during Hesperian times. Thermally distinct eject a blankets therefore reflect target material differences and/or secondary modification processes. A further discussion of EIDTH's is presented. Author (revised)

ON SYMMETRIC CENTRAL CONFIGURATIONS WITH APPLICATION TO SATELLITE MOTION ABOUT RINGS Ph.D. Thesis
Daniel Jay Scheeres 1992 272 p
Avail: Univ. Microfilms Order No. DA9308439

The theory of planetary rings is the subject of much study recently, due to the discovery of rings around all the gas giant planets in the Solar System. Most of these studies focus on explaining the fine structure of rings and on modeling specific observed phenomenon. Starting from a classical model for rings, a new model for satellite motion is derived which accounts for the gravitational attraction of the ring. This model has application to spacecraft motion near a ring, mission planning considerations, and to the natural dynamics of ring growth and stability. Specifically, the use of symmetric central configurations to study selected issues of planetary ring dynamics was investigated. Classical stability results for symmetric central configurations are reconsidered and improved. The dynamics of satellites with infinitesimal mass attracted by a class of symmetric central configurations are investigated and a new and original dynamical model for satellite motion is derived. Fundamentals of this model are studied, including Hill stability, invariant transformations, equilibrium points and their stability, and periodic orbits. Rigorous approximations to this model are introduced for different geometries. When the satellite is far from the ring, the dynamical model may be reduced to a set of integrable equations. When the satellite is close to the ring, a simplified set of non-integrable equations are found, these equations are a generalization of Hill's equations of motion applied to the case of a planetary ring. A family of periodic orbits is also derived which describes the regular motion of a satellite about a ring. Several results from the new dynamical models are discussed. Among them are a self-limiting mechanism for a planetary ring to gain mass and a derivation of the general orbit of a satellite in the presence of a ring. Future applications of the dynamical models derived are discussed. These applications apply to artificial satellites, mission planning, and natural ring dynamics. Dissert. Abstr.

THE MECHANISMS OF SOLAR VARIABILITY (MSV) PROGRAM
John W. Leibacher, Robert W. Noyes, George W. Simon, and Donald F. Neidig 8 Mar. 1993 33 p
(AF Proj. 2311)
(AD-A262525; PL-TR-93-2054) Avail: CASI HC A03/MF A01

The Mechanisms of Solar Variability (MSV) Program aims toward understanding physical causes of variations in the radiative, magnetic, and particle emissions from the Sun. Solar particle and field variations influence the interplanetary medium and the magnetosphere; UV and X-ray variations affect the Earth's upper atmosphere; and total irradiance variations are a possibly significant perturber of tropospheric climate. Solar magnetic variability provides a close-up arena for studying important but otherwise unobservable astrophysical phenomena as well. The MSV program will advance our understanding of the causes of solar variability through high angular resolution observations of the interaction of solar surface magnetic fields and convective motions, as well as related x-ray, ultraviolet, and visible brightness variations. Through these high resolution studies, MSV will complement national programs aimed at monitoring integrated solar outputs, thus contributing to the better understanding and ultimate predictability of global solar variability. THE DETECTION OF LOW-DEGREE SOLAR GRAVITY MODE OSCILLATIONS BY DIFFERENTIAL RADIUS OBSERVATIONS, 1986-1987 Ph. D. Thesis
Christopher Steven Cornuelle 1992 225 p
Avail: Univ. Microfilms Order No. DA9307677

Solar oscillations are observed by examination of time-varying properties of the photosphere. Over 800 hours of solar limb intensity profile observations in the equatorial region were collected during 1986 and 1987 at the SCLERA Mt. Bigelow site and an analysis using the FFTD was performed in an effort to detect low-degree g-mode oscillation signals in the solar photosphere. Fourier analysis of the data yielded power spectra whose peak frequencies and overall power were tested for the presence of g-mode signals at 245 classified low-degree g-mode eigenfrequencies of Hill and Gu (1990). Significant results arose from comparison of the detected eigenmode power in the 1979 data to the power density at those same classified eigenfrequencies in spectra from 1986-87 data. Also, significant correlation was found between the earlier and later mode power distributions using several different methods. Use of the parameter D(ij) to characterize the horizontal spatial behavior of eigenfunctions yielded significant results consistent with its known solar properties. Also, the observed relative signal power densities at those classified eigenfrequencies were found to be consistent with the theoretical development of Berthomieu and Provost (1990), and with previous SCLERA observations. It was noted that overall detected oscillation amplitudes in the photosphere are on average 4.0 x 0.6 times those observed in 1979, and the signal-to-noise ratio is substantially worse. The effects of instrumental defects, solar active regions, and terrestrial atmospheric noise were found to be minimal. Substantial agreement with the results of analysis of 1979 SCLERA data provides strong evidence of the correctness of the low-order g-mode classifications. The increase in g-mode signal power implied by these data, together with the other results, suggests that the photospheric behavior of these modes is variable, and perhaps solar-cycle dependent. SOLAR FLARE MDH Annual Report, 2 Jan. - 31 Dec. 1992

H. Strauss and E. Hameiri 26 Feb. 1993 8 p LIMITED REPRODUCIBILITY: Document partially illegible
(Grant AF-AFOSR-0044-91)
(AD-A262275; AFOSR-93-0162TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A new finite element time dependent, two dimensional magnetofluid code has been written. This code offers the possibility of localized mesh refinement to capture the development of current sheets, analogous to shocks by hydrodynamics. The finite difference MHD code was improved during the past year. The code is now robust, fast, and user friendly. Fast driven magnetic reconnection has been simulated in three dimensions and the reconnection time scale is consistent with one logarithmic in the plasma resistivity. A model has been found where a spontaneous discontinuous magnetic field develops from a continuous initial state, which phenomenon is believed to occur in the solar corona. Several theories of MHD and resistive MHD instabilities in the solar corona have been developed. DTIC

SESC PRODUCTS AND SERVICES USER GUIDE
Jan. 1993 64 p See also PB92-185305 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-178879) Avail: CASI HC A04

The Space Environment Services Center continuously monitors the Sun and the state of the near-Earth environment, acquiring data in real time from both ground-based and satellite-based sensors. Solar activity is monitored from satellites and observatories around the world on a 24-hour-a-day, 7-day-a-week basis. SESC forecasters issue alerts of significant solar and geomagnetic events. They also create products and provide services that summarize and predict space weather. Alerts and products are disseminated worldwide via a variety of delivery systems. The products and services are generally available to customers without cost. The document describes products, services, and delivery systems available to the customers on a range of time scales. The products include real-time alerts and warnings, daily products with summaries and forecasts, and a weekly publication of recent solar and geophysical activity. The publication is intended to allow customers already familiar with SESC to see at a glance the whole range of products and delivery systems. It does not address the needs of new customers who are not familiar with the data or how they might apply this information to their purposes. New customers are urged to contact SESC for more information. SESC collects data, in real time, to create the most timely and extensive space-weather data base in the world. Because of the urgency in collecting the data they are preliminary. Final data are available from the National Geophysical Data Center. NGDC publishes monthly reports and maintains long-term data sets for a wide range of stations and observations. NTIS

TWO-DIMENSIONAL AND THREE-DIMENSIONAL TIME-DEPENDENT MHD MODEL OF EXTENDED CORONA Ph.D. Thesis
Ai-Hua Wang 1992 153 p
Avail: Univ. Microfilms Order No. DA9306604

A new time-dependent, numerical, magnetohydrodynamic (MHD) model for the simulation on two-dimensional and three-dimensional coronal streamers and coronal holes from the solar surface (r = 1 solar radius) to 15 solar radius is presented. For the two-dimensional coronal streamer simulation, three examples are given for dipole, quadrupole, and hexapole (Legendre polynomials P(sub 1), P(sub 2), and P(sub 3)) initial field topologies. For the two-dimensional coronal hole simulation, one example is given for a dipole initial field topology. For the three-dimensional coronal streamer simulation, one example is given for a spherical harmonic function (Y(sub 2))(sup 2) (spherical harmonical function) initial field topology. The computed physical variables are density, temperature, velocity, and magnetic field. The calculation is set up as an initial-boundary value problem wherein a relaxation in time produces the steady state solution. In the present cases, the initial flow field is a polytropic, hydrodynamic solution to the steady state radial flow equation superimposed on a potential magnetic field. For the two-dimensional coronal streamers, different sizes and shapes were obtained. Inside the streamer the velocity is very small and the density is high. For the two-dimensional coronal hole the highest solar wind comes from the center of the hole. At 15 solar radius the radial flow speed is about 412 km/s. With theoretical extrapolation, it shows that the radial flow speed is in the range between 512-800 km/s at 1AU. Also, at the center of the hole the number density is low with the order of 10(exp 5)/cu cm at 2 solar radius. For the three-dimensional numerical model, the preliminary coronal streamer results are presented. In addition to the properties of the solutions, their accuracy is discussed. Dissert. Abstr.

One of the most interesting aspects of the discovery of Microwave Background Radiation (MBR) anisotropy by the COBE satellite is the ability to compare these anisotropies with the amplitude of density inhomogeneities we measure. Combining these two, we can get a 'unified' view of the inhomogeneities present in our universe on a broad range of scales. To make this comparison we must be able to translate (Delta)T/T into (delta)p/(bar p), the mass/density. This latter quantity we may try to determine from the distribution of galaxies and their velocities. DOE

We calculate limits on the properties of neutrinos using data from gamma ray detectors on the Pioneer Venus Orbiter and Solar Max Mission satellites. A massive neutrino decaying in flight from the supernova would produce gamma rays detectable by these instruments. The lack of such a signal allows us to constrain the mass, radiative lifetime, and branching ratio to photons of a massive neutrino species produced in the supernova. Author

The far infrared properties of normal non-infrared-bright galaxies were studied as a function of their morphological type using a sample of 1544 galaxies of magnitude less than 14.5. Most of the far infrared color trends as a function of galaxian morphological type can be reproduced by dust models with three components, combined with an appropriate dust heating spectral energy distribution. Work has been done on the use of far infrared luminosity as a star formation indicator in galaxies. The trends observed are consistent with a two-component model, with the citrus fraction as the second parameter and the star formation rate as the first parameter. Observations have been made and studies performed on dwarf and low surface brightness galaxies and starburst galaxies at intermediate red shifts. DTIC

The restructuring of space research in Germany after reunification is reflected in a report documenting the activities of institutes engaged in space astronomy, solar physics, the solar system, near Earth space, atmospheres and ionospheres, Earth observation, materials sciences, and life sciences. During the reported period, Rosat was launched and the first sky survey in x-rays was completed. Some 60,000 new x-ray sources, galactic and extragalactic, were found, many of them completely unexpected objects, and it is possible to determine the true diffuse x-ray background of the sky and to even see the Moon as a dark object against it. NASA's Gamma Ray Observatory (GRO), to which German scientists contributed, was launched. Some of the first results of this mission are the measurement of gamma rays from quasars and the identification of the Geminga source as a 237 msec pulsar. Other important launches were Ulysses, Galileo, CRRES, and the Texus rocket flights. A large fraction of the present activities are devoted to data reduction and the hardware development for missions like D2, Orfeus, Freja, Cluster, Soho, Mars 94/96, and more. ESA

The LDEF Meteoroid and Debris Special Investigation Group (hereafter M&D SIG) was formed to maximize the data harvest from LDEF by permitting the characterization of the meteoroid and space debris impact record of the entire satellite. Thus, our work is complementary to that of the various M&D PI's, all of whom are members of the SIG. This presentation will summarize recent results and discussions concerning five critical SIG goals: (1) classification of impactors based upon composition of residues, (2) small impact (microimpact) features, (3) impact cratering and penetration data to derive projectile sizes and masses, (4) particulate flux estimates in low-Earth orbit, and (5) the LDEF Meteoroid and Debris database. MICROMETEOROIDS AND DEBRIS ON LDEF **c90**
Jean-Claude Mandeville *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 303-312 Sponsored by NASA and CNES (For primary document see N93-29354 11-99)
Avail: CASI HC A02/MF A04

Two experiments within the French Cooperative Payload (FRECOPA) and devoted to the detection of cosmic dust were flown on the Long

Duration Exposure Facility (LDEF). A variety of sensors and collecting devices have made possible the study of impact processes on dedicated sensors and on materials of technological interest. Examination of hypervelocity impact features on these experiments gives valuable information on the size distribution and nature of interplanetary dust particles in low-Earth orbit (LEO), within the 0.5-300 micrometer size range. However no crater smaller than 1.5 microns has been observed, thus suggesting a cut-off in the near Earth particle distribution. Chemical investigation of craters by EDX clearly shows evidence of elements (Na, Mg, Si, S, Ca, and Fe) consistent with cosmic origin. However, remnants of orbital debris have been found in a few craters; this can be the result of particles in eccentric orbits about the Earth and of the 8 deg offset in the orientation of LDEF. Crater size distribution is compared with results from other dust experiments flown on LDEF and with current models. Possible origin and orbital evolution of micrometeoroids is discussed. Use of thin foil detectors for the chemical study of particle remnants looks promising for future experiments. Author (revised)

Avail: CASI HC A03/MF A04

This report focuses on the data acquired by detailed examination of LDEF intercostals, 68 of which are now in possession of the Meteoroid and Debris Special Investigation Group (M&D SIG) at JSC. In addition, limited data will be presented for several small sections from the A0178 thermal control blankets that were examined/counted prior to being shipped to Principal Investigators (PI's) for scientific study. The data presented here are limited to measurements of crater and penetration-hole diameters and their frequency of occurrence which permits, yet also constrains, more model-dependent, interpretative efforts. Such efforts will focus on the conversion of crater and penetration-hole sizes to projectile diameters (and masses), on absolute particle fluxes, and on the distribution of particle-encounter velocities. These are all complex issues that presently cannot be pursued without making various assumptions which relate, in part, to crater-scaling relationships, and to assumed trajectories of natural and man-made particle populations in LEO that control the initial impact conditions. PREDICTED AND OBSERVED DIRECTIONAL DEPENDENCE OF METEOROID/DEBRIS IMPACTS ON LDEF THERMAL BLANKETS c90

Gerhard Drolshagen *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 325-337 (For primary document see N93-29354 11-99)

Avail: CASI HC A03/MF A04

The number of impacts from meteoroids and space debris particles to the various LDEF rows is calculated using ESABASE/DEBRIS, a 3-D numerical analysis tool. It is based on recent reference environment flux models and includes geometrical and directional effects. A comparison of model predictions and actual observations is made for penetrations of the thermal blankets which covered the UHCR experiment. The thermal blankets were located on all LDEF rows, except 3, 9, and 12. Because of their uniform composition and thickness, these blankets allow a direct analysis of the directional dependence of impacts and provide a test case for the latest meteoroid and debris flux models. THREE-D CRATER ANALYSIS OF LDEF IMPACT FEATURES FROM STEREO IMAGERY c18

Clyde A. Sapp (Lockheed Engineering and Sciences Co., Houston, TX.), Thomas H. See (Lockheed Engineering and Sciences Co., Houston, TX.), and Michael E. Zolensky *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 339-345 (For primary document see N93-29354 11-99)

Avail: CASI HC A02/MF A04

The preliminary results from attempts to derive depth and diameter information from digitized stereo images of impact features on the LDEF are reported. Contrary to our prior assumption, we find that impact craters in the T6 A1 alloy are not paraboloid in cross section, but rather are better described by a 6th-order polynomial curve. We explore the implications of this discovery. Author (revised)

(Contract NAS2-13178; RTOP 199-52-12; RTOP 506-48-00)

Avail: CASI HC A02/MF A04

In the Al collectors of experiment A0138-1 of the French Cooperative Payload (FRECOPA) payload, we identified a population of small craters (3-9 microns in diameter) induced by the impacts of micron-sized grains, mainly of extraterrestrial origin. Chemical analyses of the Interplanetary Dust Particle (IDP) remnants were made in the bottoms and on the rims of the craters, in addition to immediate off-rim areas. So far, the compositional investigation of the craters by Energy Dispersive Spectroscopy (EDS) has shown evidence of an extraterrestrial origin for the impacting grains. The systematic presence of C and O in the residues has been reported and may be compared with the existence of particles showing high proportions of biogenic light elements and detected in the close environment of P-Halley comet nucleus (called CHON particles). An analytical protocol has been established in order to extract molecular and possible isotopic information on these grains, a fraction of which could be of cometary origin. Although these very small craters may show crater features that are typical of the larger Long Duration Exposure Facility (LDEF) population (greater than 50 microns), some show unique morphologies that we have not previously observed. Our initial Laser Induced Mass Spectrometry (LIMS) analytical results show strong signals for nitrogen-bearing ions in craters characterized by high C and O contents; they also suggest that carbon contents in some craters could exceed that known for carbonaceous chondrites. LONG DURATION EXPOSURE FACILITY (LDEF) EXPERIMENT M0003 METEOROID AND DEBRIS SURVEY c90

M. J. Meshishnek, S. R. Gyetvay, K. W. Paschen, and J. M. Coggi *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 357-415 Sponsored by the Strategic Defense Initiative Organization and AF Wright Lab. (For primary document see N93-29354 11-99)

Avail: CASI HC A04/MF A04

A survey of the meteoroid and space debris impacts on LDEF experiment M0003 was performed. The purpose of this survey was to document significant impact phenomenology and to obtain impact crater data for comparison to current space debris and micrometeoroid models. The survey consists of the following: photomicrographs of significant impacts in a variety of material types; accurate measurements of impact crater coordinates and dimensions for selected experiment surfaces; and databasing of the crater data for reduction, manipulation, and comparison to models. Large area surfaces that were studied include the experiment power and data system (EPDS) sunshields, environment exposure control canister (EECC) sunshields, and the M0003 signal conditioning unit (SCU) covers. Crater diameters down to 25 microns were measured and cataloged. Both leading (D8) and trailing (D4) edge surfaces were studied and compared. The EPDS sunshields are aluminum panels painted with Chemglaze A-276 white thermal control paint, the EECC sunshields are chromic acid-anodized aluminum, and the SCU covers are aluminum painted with S13GLO white thermal control paint. Typical materials that have documented impacts are metals, glasses and ceramics, composites, polymers, electronic materials, and paints. The results of this survey demonstrate the different response of materials to hypervelocity impacts. Comparison of the survey data to curves derived from the Kessler debris model and the Cour-Palais micrometeoroid model indicates that these models overpredict small impacts (less than 100 micron) and may underpredict large impacts (greater than 1000 micron) while having fair to good agreement for the intermediate impacts. Comparison of the impact distributions among the various surfaces indicates significant variations, which may be a function of material response effects, or in some cases surface roughness. Representative photographs and summary graphs of the impact data are presented. Author (revised)

DERIVATION OF PARTICULATE DIRECTIONAL INFORMATION FROM ANALYSIS OF ELLIPTICAL IMPACT CRATERS ON LDEF **c18**
P. J. Newman, N. Mackay, S. P. Deshpande, S. F. Green, and J. A. M. McDonnell *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 417-429 Sponsored by the UK Science and Engineering Research Council (For primary document see N93-29354 11-99)
Avail: CASI HC A03/MF A04

The Long Duration Exposure Facility provided a gravity gradient stabilized platform which allowed limited directional information to be derived from particle impact experiments. The morphology of impact craters on semi-infinite materials contains information which may be used to determine the direction of impact much more accurately. We demonstrate the applicability of this technique and present preliminary results of measurements from LDEF and modelling of interplanetary dust and space debris. Author

The Ion Beam textured and coated surfaces EXperiment (IBEX), designated S1003, was flown on LDEF at a location 98 deg in a north facing direction relative to the ram direction. Thirty-six diverse materials were exposed to the micrometeoroid (and some debris) environment for 5.8 years. Optical property measurements indicated no changes for almost all of the materials except S-13G, Kapton, and Kapton-coated surfaces, and these changes can be explained by other environmental effects. From the predicted micrometeoroid flux of NASA SP-8013, no significant changes in optical properties of the surfaces due to micrometeoroids were expected. There were hypervelocity impacts on the various diverse materials flown on IBEX, and the characteristics of these craters were documented using scanning electron microscopy (SEM). The S1003 alumigold-coated aluminum cover tray was sectioned into 2 cm x 2 cm pieces for crater documentation. The flux curve generated from this crater data fits well between the 1969 micrometeoroid model and the Kessler debris model for particles less than 10(exp -9) gm which were corrected for the S1003 positions (98 deg to ram). As the particle mass increases, the S1003 impact data is greater than that predicted by even the debris model. This, however, is consistent with data taken on intercostal F07 by the Micrometeoroid/Debris Special Investigating Group (M/D SIG). The mirrored surface micrometeoroid detector flown on IBEX showed no change in solar reflectance and corroborated the S1003 flux curve, as well as results of this surface flown on SERT 2 and OSO 3 for as long as 21 years. We performed a series of hypervelocity impact experiments using carbon-bearing impactors (diamond, graphite, fullerenes, phthalic acid crystals, and Murchison meteorite) into Al plate at velocities between 4.2 and 6.1 km/s. These tests were made to do the following: (1) determine the survivability of carbon forms and organize molecules in low hypervelocity impact; (2) characterize carbonaceous impactor residues; and (3) determine whether or not fullerenes could form from carbonaceous impactors, under our experimental conditions, or survive as impactors. An analytical protocol of field emission SEM imagery, SEM-EDX, laser Raman spectroscopy, single and 2-stage laser mass spectrometry, and laser induced fluorescence (LIF) found the following: (1) diamonds did not survive impact at 4.8 km/s, but were transformed into various forms of disordered graphite; (2) intact, well-ordered graphite impactors did survive impact at 5.9 km/sec, but were only found in the crater bottom centers; the degree of impact-induced disorder in the graphite increases outward (walls, rims, ejecta); (3) phthalic acid crystals were destroyed on impact (at 4.2 km/s, although a large proportion of phthalic acid molecules did survive impact); (4) fullerenes did not form as products of carbonaceous impactors (5.9 - 6.1 km/s, fullerene impactor molecules mostly survived impact at 5.9 km/s; and (5) two Murchison meteorite samples (launched at 4.8 and 5.9 km/s) show preservation of some higher mass polycyclic aromatic hydrocarbons (PAHs) compared with the non-impacted sample. Each impactor type shows unique impactor residue morphologies produced at a given impact velocity. An expanded methodology is presented to announce relatively new analytical techniques together with innovative modifications to other methods that can be used to characterize small impact residues in LDEF craters, in addition to other acquired extraterrestrial samples. As a result of man's venturing into space, the local debris contributed by his presence exceeds, at some orbital altitudes, that of the natural component. Man's contribution ranges from fuel residue to large derelect satellites that weigh many kilograms. Current debris models are able to predict the growth of the problem and suggest that spacecraft must employ armor or bumper shields for some orbital altitudes now, and that, the problem will become worse as a function of time. The practical upper limit to the velocity distribution is on the order of 40 km/s and is associated with the natural environment. The maximum velocity of the man-made component is in the 14-16 km/s range. The Long Duration Exposure Facility (LDEF) has verified that the 'high probability of impact' particles are in the microgram to milligram range. These particles can have significant effects on coatings, insulators, and thin metallic layers. The surface of thick materials becomes pitted and the local debris component is enhanced by ejecta from the debris spectrum in a controlled environment. The facility capability is discussed in terms of drive geometry, energetics, velocity distribution, diagnostics, and projectile/debris loading. The facility is currently being used to study impact phenomena on Space Station Freedom's solar array structure, other solar array materials, potential structural materials for use in the station, electrical breakdown in the space environment, and as a means of clarifying or duplicating the impact phenomena on the LDEF surfaces. The results of these experiments are described in terms of the mass/velocity distribution incident on selected samples, crater dynamics, and sample geometry. Author (revised)

SIMS CHEMICAL ANALYSIS OF EXTENDED IMPACTS ON THE LEADING AND TRAILING EDGES OF LDEF EXPERIMENT AO187-2 **c25**
S. Amari, J. Foote, P. Swan, R. M. Walker, E. Zinner, and G. Lange (Max-Planck-Inst. fuer Kernphysik, Heidelberg, Germany.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 513-528 (For primary document see N93-29354 11-99)
Avail: CASI HC A03/MF A04

Numerous 'extended impacts' found in both leading and trailing edge capture cells were successfully analyzed for the chemical composition of projectile residues by secondary ion mass spectrometry (SIMS). Most data were obtained from the trailing edge cells where 45 of 58 impacts were classified as 'probably natural' and the remainder as 'possibly man-made debris.' This is in striking contrast to leading edge cells where 9 of 11 impacts so far measured are definitely classified as orbital debris. Although all the leading edge cells had lost their plastic entrance foils during flight, the rate of foil failure was similar to that of the trailing edge cells, 10 percent of which were recovered intact. Ultraviolet embrittlement is suspected as the major cause of failure on both leading and trailing edges. The major impediment to the accurate determination of projectile chemistry is the fractionation of volatile and refractory elements in the hypervelocity impact and redeposition processes. This effect had been noted in a simulation experiment but is more pronounced in the LDEF capture cells, probably due to the higher average velocities of the space impacts. Surface contamination of the pure Ge surfaces with a substance rich in Si, but also containing Mg and Al, provides an additional problem for the accurate determination of impactor chemistry. The effect is variable, being much larger on surfaces that were exposed to space than in those cells that remained intact. Future work will concentrate on the analyses of more leading edge impacts and the development of new SIMS techniques for the measurement of elemental abundances in extended impacts. Author (revised)

Avail: CASI HC A03/MF A04

Mechanical strength measurements on five glasses and one glass-ceramic exposed on LDEF revealed no damage exceeding experimental limits of error. The measurement technique subjected less than 5 percent of the sample surface area to stresses above 90 percent of the failure strength. Seven micrometeorite or space debris impacts occurred at locations which were not in that portion of the sample subjected to greater than 90 percent of the applied stress. As a result of this, the impact events on the sample were not detected in the mechanical strength measurements. The physical form and structure of the impact sites was carefully examined to determine the influence of those events upon stress concentration associated with the impact and the resulting mechanical strength. The size of the impact site, insofar as it determines flaw size for fracture purposes, was examined. Surface topography of the impacts reveals that six of the seven sites display impact melting. The classical melt crater structure is surrounded by a zone of fractured glass. Residual stresses arising from shock compression and from cooling of the fused zone cannot be included in the fracture mechanics analyses based on simple flaw size measurements. Strategies for refining estimates of mechanical strength degradation by impact events are presented. Author (revised)

PROJECTILE COMPOSITIONS AND MODAL FREQUENCIES ON THE CHEMISTRY OF MICROMETEOROIDS LDEF EXPERIMENT **c90**
Ronald P. Bernhard (Lockheed Engineering and Sciences Co., Houston, TX.), Thomas H. See (Lockheed Engineering and Sciences Co., Houston, TX.), and Friedrich Hoerz *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 551-573 (For primary document see N93-29354 11-99)
Avail: CASI HC A03/MF A04

The Chemistry of Micrometeoroids Experiment (LDEF instrument A0187-1) exposed witness plates of high-purity gold (greater than 99.99 percent Au) and commercial aluminum (greater than 99 percent Al) with the objective of analyzing the residues of cosmic-dust and orbital-debris particles associated with hypervelocity impact craters. The gold substrates were located approximately 8 deg off LDEF's trailing edge (Bay A03), while the aluminum surfaces resided in Bay A11, approximately 52 deg from LDEF's leading edge. SEM-EDX techniques were employed to analyze the residues associated with 199 impacts on the gold and 415 impacts on the aluminum surfaces. The residues that could be analyzed represent natural or man-made materials. The natural particles dominate at all particle sizes less than 5 micron. It is possible to subdivide both particle populations into subclasses. Chondritic compositions dominate the natural impactors (71 percent), followed by monomineralic, mafic-silicate compositions (26 percent), and by Fe-Ni rich sulfides (approximately 3 percent). Approximately 30 percent of all craters on the gold collectors were caused by man-made debris such as aluminum, paint flakes, and other disintegrated, structural and electronic components. Equations-of-state and associated calculations of shock stresses for typical LDEF impacts into the gold and aluminum substrates suggest that substantial vaporization may have occurred during many of the impacts and is the reason why approximately 50 percent of all craters did not contain sufficient residue to permit analysis by the SEM-EDX technique. After converting the crater diameters into projectile sizes using encounter speeds typical for the trailing-edge and forward-facing (Row 11) directions, and accounting for normalized exposure conditions of the CME collectors, we derived the absolute and relative fluxes of specific projectile classes. The natural impactors encounter all LDEF pointing directions with comparable, modal frequencies suggesting compositional (and dynamic) homogeneity of the interplanetary-dust environment in near-Earth orbit. ASTEROIDAL VERSUS COMETARY METEOROID IMPACTS ON THE LONG DURATION EXPOSURE FACILITY (LDEF) Abstract Only c90

Herbert A. Zook *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 575 (For primary document see N93-29354 11-99)

Avail: CASI HC A01/MF A04

Meteoroids that enter the Earth's atmosphere at low velocities will tend to impact the apex side (that surface facing the spacecraft direction of motion) of a spacecraft at a very high rate compared to the rate with which they will impact an antapex-facing surface. This ratio--apex to antapex impact rates--will become less as meteoroid entry velocities increase. The measured ration, apex to antapex, for 500 micron diameter impact craters in 6061-T6 aluminum on LDEF seems to be about 20 from the work of the meteoroid SIG group and others, that was presented at the first LDEF symposium. Such a ratio is more consistent with the meteoroid velocity distributions derived by Erickson and by Kessler, than it is with others that have been tested. These meteoroid velocity distributions have mean entry velocities into the Earth's atmosphere of 16.5 to 16.9 km/s. Others have numerically simulated the orbital evolution of small dust grains emitted from asteroids and comets. For those asteroidal grains small enough (below about 100 microns diameter) to drift from the asteroid belt to the orbit of the Earth, under P-R and solar wind drag, without suffering collisional destruction, the following results are found: as the ascending or descending nodes cross the Earth's orbit, their orbital eccentricities and inclinations are quite low (e less than 0.3, i less than 20 deg), and their mean velocity with respect to the Earth is about 5 or 6 km/s. When gravitational acceleration of the Earth is taken into account, the corresponding mean velocities relative to the top of the Earth's atmosphere are 12 to 13 km/s. This means that, at best, these small asteroidal particles cannot comprise more than 50 percent of the particles entering the Earth's atmosphere. When gravitational focusing is considered, they cannot comprise more than a few percent of those in heliocentric orbit at 1 AU. The rest are presumably of cometary origin. Author (revised)

Avail: CASI HC A02/MF A04

We have examined craters in Al and Au LDEF surfaces to determine the nature of meteoroid residue in the rare cases where projectile material is abundantly preserved in the crater floor. Typical craters contain only small amounts of residue and we find that less than 10 percent of the craters in Al have retained abundant residue consistent with survival of a significant fraction (greater than 20 percent) of the projectile mass. The residue-rich craters can usually be distinguished optically because their interiors are darker than ones with little or no apparent projectile debris. The character of the meteoroid debris in these craters ranges from thin glass liners, to thick vesicular glass containing unmelted mineral fragments, to debris dominated by unmelted mineral fragments. In the best cases of meteoroid survival, unmelted mineral fragments preserve both information on projectile mineralogy as well as other properties such as nuclear tracks caused by solar flare irradiation. The wide range of the observed abundance and alteration state of projectile residue is most probably due to differences in impact velocity. The crater liners are being studied to determine the composition of meteoroids reaching the Earth. The compositional types most commonly seen in the craters are: (1) chondritic (Mg, Si, S, Fe in approximately solar proportions), (2) Mg silicate. amd (3) iron sulfide. These are also the most common compositional types of extraterrestrial particle types collected in the stratosphere. The correlation between these compositions indicates that vapor fractionation was not a major process influencing residue composition in these craters. Although the biases involved with finding analyzable meteoroid debris in metal craters differ from those for extraterrestrial particles collected in and below the atmosphere, there is a common bias favoring particles with low entry velocity. For craters this is very strong and probably all of the metal craters with abundant residue were caused by asteroidal dust impacting at minimum velocities. Author (revised)

ORIGIN OF ORBITAL DEBRIS IMPACTS ON LDEF'S TRAILING SURFACES c18

Donald J. Kessler *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 585-593 (For primary document see N93-29354 11-99)

Avail: CASI HC A02/MF A04

A model was developed to determine the origin of orbital impacts measured on the training surfaces of LDEF. The model calculates the expected debris impact crater distribution around LDEF as a function of debris orbital parameters. The results show that only highly elliptical, low inclination orbits could be responsible for these impacts. The most common objects left in this type of orbit are orbital transfer stages used by the U.S. and ESA to place payloads into geosynchronous orbit. Objects in this type of orbit are difficult to catalog by the U.S. Space Command; consequently there are independent reasons to believe that the catalog does not adequately represent this population. This analysis concludes that the relative number of cataloged objects with highly elliptical, low inclination orbits must be increased by a factor of 20 to be consistent with the LDEF data. With the U.S. about to embark on a new space age, the effects of the space environment on a spacecraft during its mission lifetime become more relevant. Included among these potential effects are degradation and erosion due to micrometeoroid and debris impacts, atomic oxygen and ultraviolet light exposure as well as material alteration from thermal cycling, and electron and proton exposure. This paper focuses on the effects caused by micrometeoroid and debris impacts on several LDEF aluminum plates from four different bay locations: C-12, C-10, C-01, and E-09. Each plate was coated with either a white, black, or gray thermal paint. Since the plates were located at different orientations on the satellite, their responses to the hypervelocity impacts varied. Crater morphologies range from a series of craters, spall zones, domes, spaces, and rings to simple craters with little or no spall zones. In addition, each of these crater morphologies is associated with varying damage areas, which appear to be related to their respective bay locations and thus exposure angles. More than 5% of the exposed surface area examined was damaged by impact cratering and its coincident effects (i.e., spallation, delamination and blow-off). Thus, results from this analysis may be significant for mission and spacecraft planners and designers. Author (revised)

The relationship between the observed cratering impact damage on the Long Duration Exposure Facility (LDEF) versus the existing models for both the natural environment of micrometeoroids and the man-made debris was investigated. Experimental data was provided by several LDEF Principal Investigators, Meteoroid and Debris Special Investigation Group (M&D SIG) members, and by the Kennedy Space Center Analysis Team (KSC A-Team)

members. These data were collected from various aluminum materials around the LDEF satellite. A PC (personal computer) computer program, SPENV, was written which incorporates the existing models of the Low Earth Orbit (LEO) environment. This program calculates the expected number of impacts per unit area as functions of altitude, orbital inclination, time in orbit, and direction of the spacecraft surface relative to the velocity vector, for both micrometeoroids and man-made debris. Since both particle models are couched in terms of impact fluxes versus impactor particle size, and much of the LDEF data is in the form of crater production rates, scaling laws have been used to relate the two. Also many hydrodynamic impact computer simulations were conducted, using CTH, of various impact events, that identified certain modes of response, including simple metallic target cratering, perforations and delamination effects of coatings.

NEW METEOROID MODEL PREDICTIONS FOR DIRECTIONAL IMPACTS ON LDEF Abstract Only

c90

Neil Divine and Rene C. Agueero *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 665 (For primary document see N93-29354 11-99)
Avail: CASI HC A01/MF A04

An extensive body of data, from meteors, zodiacal light, spacecraft-borne impact detectors (Helios, Pioneer, Galileo, Ulysses), and other sources, forms the basis of a new numerical model for the distributions of interplanetary meteoroids. For each of the five populations in this model it is possible to evaluate meteoroid concentration and flux for oriented surfaces or detectors having arbitrary position and velocity in interplanetary space. For a spacecraft in geocentric orbit the effects of gravitational focussing and shielding by the Earth have been newly derived with full attention to the directionality of the particles, both on approach (i.e., relative to a massless Earth) and at the target. This modeling approach was exercised to provide an estimate of meteoroid fluence for each of several oriented surfaces on LDEF.

Analysis of the data from the Long Duration Exposure Facility (LDEF) Interplanetary Dust Experiment (IDE) sun sensors has allowed a confirmation of the attitude of LDEF during its first year in orbit. Eight observations of the yaw angle at specific times were made and are tabulated in this paper. These values range from 4.3 to 12.4 deg with maximum uncertainty of plus or minus 2.0 deg and an average of 7.9 deg. No specific measurements of pitch or roll were made but the data indicates that LDEF had an average pitch down attitude of less than 0.7 deg.

ELEMENTAL ANALYSES OF HYPERVELOCITY MICROPARTICLE IMPACT SITES ON INTERPLANETARY DUST EXPERIMENT SENSOR SURFACES

c90

Charles G. Simon, J. L. Hunter (North Carolina Univ., Raleigh.), D. P. Griffis (North Carolina Univ., Raleigh.), V. Misra (North Carolina Univ., Raleigh.), D. A. Ricks (North Carolina Univ., Raleigh.), Jim J. Wortman (North Carolina Univ., Raleigh.), and D. E. Brownlee (Washington Univ., Seattle.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 677-692 (For primary document see N93-29354 11-99)
Avail: CASI HC A03/MF A04

The Interplanetary Dust Experiment (IDE) had over 450 electrically active ultra-high purity metal-oxide-silicon impact detectors located on the six primary sides of the Long Duration Exposure Facility (LDEF). Hypervelocity microparticles (approximately 0.2 to approximately 100 micron diameter) that struck the active sensors with enough energy to break down the 0.4 or 1.0 micron thick SIO2 insulator layer separating the silicon base (the negative electrode), and the 1000 A thick surface layer of aluminum (the positive electrode) caused electrical discharges that were recorded for the first year of orbit. The high purity Al-SiO2-Si substrates allowed detection of trace (ppm) amounts of hypervelocity impactor residues. After sputtering through a layer of surface contamination, secondary ion mass spectrometry (SIMS) was used to create two-dimensional elemental ion intensity maps of microparticle impact sites on the IDE sensors. The element intensities in the central craters of the impacts were corrected for relative ion yields and instrumental conditions and then normalized to silicon. The results were used to classify the particles' origins as 'manmade,' 'natural,' or 'indeterminate.' The last classification resulted from the presence of too little impactor residue, analytical interference from high background contamination, the lack of information on silicon and aluminum residues, or a combination of these circumstances. Several analytical 'blank' discharges were induced on flight sensors by pressing down on the sensor surface with a pure silicon shard. Analyses of these blank discharges showed that the discharge energy blasts away the layer of surface contamination. Only Si and Al were detected inside the discharge zones, including the central craters of these features. Thus far a total of 79 randomly selected microparticle impact sites from the six primary sides of the LDEF have been analyzed: 36 from tray C-9 (Leading (ram), or East, side), 18 from tray C-3 (Trailing (wake), or West, side), 12 from tray B-12 (North side), 4 from tray D-6 (South side), 3 from tray H-11 (Space end), and 6 from tray G-10 (Earth end). Residue from manmade debris was identified in craters on all trays. (Aluminum oxide particle residues were not detectable on the Al/Si substrates.) These results were consistent with the IDE impact record which showed highly variable long term microparticle impact flux rates on the West, Space and Earth sides of the LDEF which could not be ascribed to astronomical variability of micrometeorite density. The IDE record also showed episodic bursts of microparticle impacts on the East, North, and South sides of the satellite, denoting passage through orbital debris clouds or rings.

The electronic sensors of the Interplanetary Dust Experiment (IDE) recorded precise impact times and approximate directions for submicron to approximately 100 micron size particles on all six primary sides of the spacecraft for the first 346 days of the LDEF orbital mission. Previously-reported analyses of the timed impact data have established their spatio-temporal features, including the demonstration that a preponderance of the particles in this regime are orbital debris and that a large fraction of the debris particles are encountered in megameter-size clouds. Short-term fluxes within such clouds can rise several orders of magnitude above the long-term average. These unexpectedly large short-term variations in debris flux raise the question of how representative an indication of the multi-year average flux is given by the nearly one year of timed data. One of the goals of the IDE was to conduct an optical survey of impact sites on detectors that remained active during the entire LDEF mission, to obtain full-mission fluxes. We present here the comparisons and contrasts among the new IDE optical survey impact data, the IDE first-year timed impact data, and impact data from other LDEF micrometeoroid and debris experiments. The following observations are reported: (1) the 5.77 year long-term integrated microparticle impact fluxes recorded by IDE detectors matched the integrated impact fluxes measured by other LDEF investigators for the same period; (2) IDE integrated microparticle impact fluxes varied by factors from 0.5 to 8.3 for LDEF days 1-346, 347-2106 and 1-2106 (5.77 years) on rows 3 (trailing edge, or West), 6 (South side), 12 (North side), and the Earth and Space ends; and (3) IDE integrated microparticle impact fluxes varied less than 3 percent for LDEF days 1-346, 347-2106 and 1-2106 (5.77 years) on row 9 (leading edge, or East). These results give further evidence of the accuracy and internal consistency of the recorded IDE impact data. This leads to the further conclusion that the utility of long-term ratios for impacts on various sides of a stabilized satellite in low Earth orbit (LEO) is extremely limited. These observations and their consequences highlight the need for continuous, real time monitoring of the dynamic microparticle environment in LEO. Author (revised)

THE INTERSTELLAR GAS EXPERIMENT: ANALYSIS IN PROGRESS **c90**
F. Buehler, D. L. Lind (Utah State Univ., Logan.), J. Geiss, and O. Eugster *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 705-723 (For primary document see N93-29354 11-99)
Avail: CASI HC A03/MF A04

The Interstellar Gas Experiment (IGE) exposed thin metallic foils aboard the LDEF spacecraft in low Earth orbit in order to collect neutral interstellar particles which penetrate the solar system due to their motion relative to the sun. By mechanical penetration these atoms were imbedded in the collecting foils along with precipitating magnetospheric ions and, possibly, with ambient atmospheric atoms. During the entire LDEF mission, seven of these foils collected particles arriving from seven different directions as seen from the spacecraft. After the foils were returned to Earth, a mass spectrometric analysis of the noble gas component of the trapped particles was begun. The isotopes of He-3, He-4, Ne-20, and Ne-22 were detected. We have given a first account of the experiment. In order to infer the isotopic ratios in the interstellar medium from the concentrations found in the foils, several lines of investigation had to be initiated. The flux of ambient atmospheric noble gas atoms moving toward the foils due to the orbital motion of LDEF was estimated by detailed calculations. Any of these particles which evaded the baffles in the IGE collector could be entrapped in the foils as a background flux. However, the calculations have shown that this flux is negligible, which was the intent of the experiment hardware design. This conclusion is supported by the measurements. However, both the concentration of trapped helium and its impact energy indicate that the flux of magnetospheric ions which was captured was larger than had been expected. In fact, it appears that the magnetospheric particles constitute the largest fraction of the particles in the foils. Since little is known about this particle flux, their presence in the IGE foils appears fortunate. The analysis of these particles provides information about their isotropic composition and average flux. Author (revised)

FOLLOW UP ON THE CRYSTAL GROWTH EXPERIMENTS OF THE LDEF **c76**
K. F. Nielsen and M. D. Lind (Rockwell International Science Center, Thousand Oaks, CA.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Second Post-Retrieval Symposium, Part 2 Apr. 1993 p 725-733 (For primary document see N93-29354 11-99)
Avail: CASI HC A02/MF A04

The results of the 4 solution growth experiments on the LDEF have been published elsewhere. Both the crystals of CaCO3, which were large and well shaped, and the much smaller TTF-TCNQ crystals showed unusual morphological behavior. The follow up on these experiments was begun in 1981, when ESA initiated a 'Concept Definition Study' on a large, 150 kg, Solution Growth Facility (SGF) to be included in the payload of EURECA-1, the European Retrievable Carrier. This carrier was a continuation of the European Spacelab and at that time planned for launch in 1987. The long delay of the LDEF retrieval and of subsequent missions brought about reflections both on the concept of crystal growth in space and on the choice of crystallization materials that had been made for the LDEF. Already before the LDEF retrieval, research on TTF-TCNQ had been stopped, and a planned growth experiment with TTF-TCNQ on the SGF/EURECA had been cancelled. The target of the SGF investigation is now more fundamental in nature. None of the crystals to be grown here are, like TTF-TCNQ, in particular demand by science or industry, and the crystals only serve the purpose of model crystals. The real purpose of the investigation is to study the growth behavior. One of the experiments, the Soret Coefficient Measurement experiment is not growing crystals at all, but has it as its sole purpose to obtain accurate information on thermal diffusion, a process of importance in crystal growth from solution. THE PREHISTORY OF ESRO, 1959 - 1960
John Krige (European Univ. Inst., Florence, Italy.) Jul. 1992 35 p
(ESA-HSR-1) Avail: CASI HC A03/MF A01

The origins of a joint European space effort are generally traced back to a number of initiatives taken in 1959 and 1960 by a small group of scientists and science administrators, catalyzed by two friends, physicists and scientific statesmen, Edoardo Amaldi and Pierre Auger. Neither Amaldi nor Auger was a stranger to the cause of scientific collaboration on a European scale. Indeed it was they who, in the early 1950s, were key actors in the process which led to the setting up of CERN, the European Organization for Nuclear Research. Now, as the decade drew to a close, they turned their attention to space. Success was rapid. Within a year of the first formal discussions being held amongst scientists European governments had set up a preparatory commission to explore the possibilities for a joint space research effort. The most striking feature of the story presented here is the transformation of the scientist's original project into one which was more modest in scope- and over which they could hope to retain a large measure of control. Various aspects of the project transformation are presented. Author (revised)

REFINEMENTS ON THE PINHOLE CAMERA MEASUREMENTS OF THE LDEF ATTITUDE **c18**

Palmer N. Peters, Paul N. Whitehouse, and John C. Gregory (Alabama Univ., Huntsville.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 3-12 (For primary document see N93-29621 11-99)
Avail: CASI HC A02/MF A03

The results from the University of Alabama in Huntsville (UAH) pinhole camera were reanalyzed to include the effects of corotation of the atmosphere with the Earth as well as satellite oscillation. Previous results from the instrument showed that the satellite had stable attitude offsets in yaw of 8.0 deg and 1.0 deg in pitch; these offsets are unchanged by the present analysis. The primary impact zone of oxygen, i.e., the directly exposed spot on a silver detector, had a ratio of major to minor axes equal to 1.05, which was interpreted as being caused by a small oscillation of plus or minus 0.35 degrees (with precision plus or minus 0.15 degrees). The present analysis shows that the observed effect can largely be accounted for by atmospheric corotation, but that an additional oscillation in yaw of the order of a degree cannot be excluded. The sensitivity of the pinhole camera to satellite oscillations is shown to decrease nonlinearly with decreasing magnitude of the oscillation and to vary inversely with the gas temperature. R. J. Bourassa, H. G. Pippin, and J. R. Gillis *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 13-25 (For primary document see N93-29621 11-99)
(Contract NAS1-19247)
Avail: CASI HC A03/MF A03

A computer model for prediction of atomic oxygen exposure of spacecraft in low earth orbit, referred to as the primary atomic oxygen model, was originally described at the First Long Duration Exposure Facility (LDEF) Post-Retrieval Symposium. The primary atomic oxygen model accounts for variations in orbit parameters, the condition of the atmosphere, and for the orientation of exposed surfaces relative to the direction of spacecraft motion. The use of the primary atomic oxygen model to define average atomic oxygen exposure conditions for a spacecraft is discussed and a second microenvironments computer model is described that accounts for shadowing and scattering of atomic oxygen by complex surface protrusions and indentations. Comparisons of observed and predicted erosion of fluorinated ethylene propylene (FEP) thermal control blankets using the models are presented. Experimental and theoretical results are in excellent agreement. Work is in progress to expand modeling capability to include ultraviolet radiation exposure and to obtain more detailed information on reflecting and scattering characteristics of material surfaces. A GENERALIZED APPROACH TO THE THERMAL ANALYSIS OF THE LONG DURATION EXPOSURE FACILITY'S FLIGHT EXPERIMENTS c34
Thomas R. Sampair *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 27-50 (For primary document see N93-29621 11-99)
Avail: CASI HC A03/MF A03

The generalized method employed in the thermal analysis of a Long Duration Exposure Facility (LDEF) flight experiment is presented. The method consists of thermal math model development, defining the orbital heating rates, and applying the appropriate temperature boundary conditions. This approach has proven to be an accurate method for predicting experiment component temperatures for the worst case orbital environments and calculating daily average component temperatures for any part or all time portions of the 5.8 year mission. The application of this method to the thermal analysis of the Ultra-Heavy Cosmic-Ray Nuclei experiment (UHCRE) is presented as an example of this approach. Author

EnviroNET: ON-LINE INFORMATION FOR LDEF c82
Michael Lauriente *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium 51-67 (SEE N93-29621 11-99) Apr. 1993 (For primary document see N93-29621 11-99)
Avail: CASI HC A03/MF A03

EnviroNET is an on-line, free-form database intended to provide a centralized repository for a wide range of technical information on environmentally induced interactions of use to Space Shuttle customers and spacecraft designers. It provides a user-friendly, menu-driven format on networks that are connected globally and is available twenty-four hours a day - every day. The information, updated regularly, includes expository text, tabular numerical data, charts and graphs, and models. The system pools space data collected over the years by NASA, USAF, other government research facilities, industry, universities, and the European Space Agency. The models accept parameter input from the user, then calculate and display the derived values corresponding to that input. In addition to the archive, interactive graphics programs are also available on space debris, the neutral atmosphere, radiation, magnetic fields, and the ionosphere. A user-friendly, informative interface is standard for all the models and includes a pop-up help window with information on inputs, outputs, and caveats. The system will eventually simplify mission analysis with analytical tools and deliver solutions for computationally intense graphical applications to do 'What if...' scenarios. A proposed plan for developing a repository of information from the Long Duration Exposure Facility (LDEF) for a user group is presented. Author (revised)

STATUS OF LDEF IONIZING RADIATION MEASUREMENTS AND ANALYSIS c93
Thomas A. Parnell *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 69-78 (For primary document see N93-29621 11-99)
Avail: CASI HC A02/MF A03

At this symposium significant new data and analyses were reported in cosmic ray research, radiation dosimetry, induced radioactivity, and radiation environment modeling. Measurements of induced radioactivity and absorbed dose are nearly complete, but much analysis and modeling remains. Measurements and analyses of passive nuclear track detectors (PNTD), used to derive the cosmic ray composition and spectra, and linear energy transfer (LET) spectra, are only a few percent complete, but important results have already emerged. As one might expect at this stage of the research, some of the new information has produced questions rather than answers. Low-energy heavy nuclei detected by two experiments are not compatible with known solar or cosmic components. Various data sets on absorbed dose are not consistent, and a new trapped proton environment model does not match the absorbed dose data. A search for cosmogenic nuclei other than Be-7 on Long Duration Exposure Facility (LDEF) surfaces has produced an unexpected result, and some activation data relating to neutrons is not yet understood. Most of these issues will be resolved by the analysis of further experiment data, calibrations, or the application of the large LDEF data set that offers alternate data or analysis techniques bearing on the same problem. The scope of the papers at this symposium defy a compact technical summary. I have attempted to group the new information that I noted into the following groups: induced radioactivity; absorbed dose measurements; LET spectra and heavy ion dosimetry; environment modeling and three dimensional shielding effects; cosmogenic nuclei; and cosmic rays and other heavy ions. The papers generally are expository and have excellent illustrations, and I refer to their figures rather than reproduce them here. The general program and objectives of ionizing radiation measurements and analyses on LDEF has been described previously. Author (revised)

RADIOACTIVITIES INDUCED IN SOME LDEF SAMPLES c72
Robert C. Reedy, Calvin E. Moss, S. George Bobias, and Jozef Masarik *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 87-96 (For primary document see N93-29621 11-99)
Avail: CASI HC A02/MF A03

Radioactivities induced in several Long Duration Exposure Facilities (LDEF) samples were measured by low-level counting at Los Alamos and elsewhere. These radionuclides have activities similar to those observed in meteorites and lunar samples. Some trends were observed in these measurements in terms of profiles in trunnion layers and as a function of radionuclide half-life. Several existing computer codes were used to model the production by the protons trapped in the Earth's radiation belts and by the galactic cosmic rays of some of these radionuclides, Mn-54 and Co-57 in steel, Sc-46 in titanium, and Na-22 in alloys of titanium and aluminum. Production rates were also calculated for radionuclides possibly implanted in LDEF, Be-7, Be-10, and C-14. Enhanced concentrations of induced isotopes in the surfaces of trunnion sections relative to their concentrations in the center are caused by the lower-energy protons in the trapped radiation. Secondary neutrons made by high-energy trapped protons and by galactic cosmic rays produce much of the observed radioactivities, especially deep in an object. Comparisons of the observed to calculated activities of several radionuclides with different half-lives indicate that the flux of trapped protons at LDEF decreased significantly at the end of the mission. A year ago at the First Long Duration Exposure Facility (LDEF) Post-Retrieval Symposium, detailed measurements on trunnion sections, as well as results from 'intentional' samples (Co, Ni, In, Ta, and V) and spacecraft parts were reported. For this year's Symposium, some of these findings are re-evaluated in combination with more recent results, to cast a longer perspective on the LDEF experience, and to sketch some promising avenues toward more effective participation in future missions. The LDEF analysis effort has been a superb training exercise, from which lessons learned need to be applied to future missions - right back to the early phases of mission planning. Author (revised)

CHARGED PARTICLE ACTIVATION STUDIES ON THE SURFACE OF LDEF SPACECRAFT c72
Ilhan Olmez, Forest Burns (Army Materials Technology Lab., Watertown, MA.), and Paul Sagalyn (Army Materials Technology Lab., Watertown, MA.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 107-109 (For primary document see N93-29621 11-99)
Avail: CASI HC A01/MF A03

High energy proton induced nuclear reaction products are examined using seven elements, namely, Aluminum, Silicon, Nickel, Copper, Zirconium, Tantalum, and Tungsten. The samples were in the form of plates, 2 x 2 x 1/8 inches. Activities due to Na-22 from Al, Co-56 and Co-57 from Ni, Co-58 from Cu, and Y-88 from Zr targets were detected. No induced activity was observed in Si, Ta, and W, most probably due to the long cooling times. Only the Zr sample contained a weak Be-7 peak, although Ta and W were also located at the leading edge of the spacecraft. Gamma-rays of individual isotopes were measured using high-resolution Ge(Li) solid state detector coupled to 4096-multichannel analyzer. Activities were calculated for Co-56 (846 keV) and Co-57 (122 and 136 keV's) at the time of the entry of the spacecraft and found to be 0.014 plus or minus 0.005 c/sec. g, 0.018 plus or minus 0.002 c/sec. g, and 0.0024 plus or minus 0.0007 c/sec. g, respectively. Avail: CASI HC A03/MF A03

The study of the induced radioactivity of samples intentionally placed aboard the Long Duration Exposure Facility (LDEF) and samples obtained from the LDEF structure is reviewed. The eight laboratories involved in the gamma-ray counting are listed and the scientists and the associated counting facilities are described. Presently, most of the gamma-ray counting has been completed and the spectra are being analyzed and corrected for efficiency and self absorption. The acquired spectra are being collected at Eastern Kentucky University for future reference. The results of these analyses are being compiled and reviewed for possible inconsistencies as well as for comparison with model calculations. These model calculations are being revised to include the changes in trapped-proton flux caused by the onset of the period of maximum solar activity and the rapidly decreasing spacecraft orbit. Tentative plans are given for the storage of the approximately 1000 gamma-ray spectra acquired in this study and the related experimental data. Author

INDUCED ACTIVATION STUDY OF LDEF c72
B. A. Harmon, G. J. Fishman, T. A. Parnell, and C. E. Laird (University of Eastern Kentucky, Richmond.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 125-136 (For primary document see N93-29621 11-99)
Avail: CASI HC A03/MF A03

Analysis of the induced radioactivity of the Long Duration Exposure Facility (LDEF) is continuing with extraction of specific activities for various spacecraft materials. Data and results of activation measurements from eight facilities are being collected for interpretation at Eastern Kentucky University and NASA/Marshall Space Flight Center. The major activation mechanism in LDEF components is the proton flux in the South Atlantic Anomaly (SAA). This flux is highly anisotropic, and could be sampled by taking advantage of the gravity-gradient stabilization of the LDEF. The directionally-dependent activation due to these protons was clearly observed in the data from aluminum experiment tray clamps (reaction product Na-22), steel trunnions (reaction product Mn-54 and others) and is also indicated by the presence of a variety of nuclides in other materials. A secondary production mechanism, thermal neutron capture, was observed in cobalt, indium, and tantalum, which are known to have large capture cross sections. Experiments containing samples of these metals and significant amounts of thermalizing low atomic number (Z) material showed clear evidence of enhanced activation of Co-60, In-114m, and Ta-182. Other mechanisms which activate spacecraft material that are not as easily separable from SAA proton activation, such as galactic proton bombardment and secondary production by fast neutrons, are being investigated by comparison to radiation environmental calculations. Deviations from one-dimensional radiation models indicate that these mechanisms are more important at greater shielding depths. The current status of the induced radioactivity measurements as of mid-year 1992 are reviewed. Specific activities for a number of materials which show SAA effects and thermal neutron capture are presented. The results for consistency by combining data from the participating institutions is also examined. Author (revised)

The Long Duration Exposure Facility (LDEF) spacecraft flew in a 28.5 deg inclination circular orbit with an altitude in the range from 319.4 to 478.7 km. For this orbital altitude and inclination, two components contribute most of the penetrating charge particle radiation encountered - the galactic cosmic rays and the geomagnetically trapped Van Allen protons. Where shielding is less than 1.0 g/sq cm geomagnetically trapped electrons make a significant contribution. The 'Vette' models together with the associated magnetic field models and the solar conditions were used to obtain the trapped electron and proton omnidirectional fluences reported previously. Results for directional proton spectra using the MSFC anisotropy model for solar minimum and 463 km altitude (representative for the LDEF mission) were also reported. The directional trapped proton flux as a function of mission time is presented considering altitude and solar activity variation during the mission. These additional results represent an extension of previous calculations to provide a more definitive description of the LDEF trapped proton exposure. Author (revised)

A MEASUREMENT OF THE RADIATION DOSE TO LDEF BY PASSIVE DOSIMETRY **c72**
J. B. Blake and S. S. Imamoto *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 147-155 (For primary document see N93-29621 11-99)
(Contract F04701-88-C-0089)
Avail: CASI HC A02/MF A03

The results from a pair of thermoluminescent dosimeter experiments flown aboard the Long Duration Exposure Facility (LDEF) show an integrated dose several times smaller than that predicted by the NASA environmental models for shielding thicknesses much greater than 0.10 gm/sq cm aluminum. For thicknesses between 0.01 and 0.1 gm/sq cm, the measured dose was in agreement with predictions. The Space and Environment Technology Center of The Aerospace Corporation fielded two related experiments on LDEF to measure the energetic radiation dose by means of passive dosimetry. The sensors were LiF thermoluminescent dosimeters mounted behind various thicknesses of shielding. The details of the experiment are described first, followed by the results of the observations. A comparison is made with the predictions based upon the NASA environmental models and the actual mission profile flown by LDEF; conclusions follow. Author (revised)

LDEF: DOSIMETRIC MEASUREMENT RESULTS (AO 138-7 EXPERIMENT) **c72**
J. Bourrieau *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 157-162 (For primary document see N93-29621 11-99)
Avail: CASI HC A02/MF A03

One of the objectives of the AO 138-7 experiment on board the Long Duration Exposure Facility (LDEF) was a total dose measurement with Thermo Luminescent Detectors (TLD 100). Two identical packages, both of them including five TLD's inside various aluminum shields, are exposed to the space environment in order to obtain the absorbed dose profile. Radiation fluence received during the total mission length was computed, taking into account the trapped particles (AE8 and AP8 models during solar maximum and minimum periods) and the cosmic rays; due to the magnetospheric shielding the solar proton fluences are negligible on the LDEF orbit. The total dose induced by these radiations inside a semi infinite plane shield of aluminum are computed with the radiation transport codes available at DERTS. The dose profile obtained is in good agreement with the evaluation by E.V. Benton. TLD readings are performed after flight; due to the mission duration increase a post flight calibration was necessary in order to cover the range of the in flight induced dose. The results obtained, similar (plus or minus 30 percent) for both packages, are compared with the dose profile computation. For thick shields it seems that the measurements exceed the forecast (about 40 percent). That can be due to a cosmic ray and trapped proton contributions coming from the backside (assumed as perfectly shielded by the LDEF structure in the computation), or to an underestimate of the proton or cosmic ray fluences. A fine structural shielding analysis should be necessary in order to determine the origin of this slight discrepancy between forecast and in flight measurements. For the less shielded dosimeters, mainly exposed to the trapped electron flux, a slight overestimation of the dose (less than 40 percent) appears. Due to the dispersion of the TLD's response, this cannot be confirmed. In practice these results obtained on board LDEF, with less than a factor 1.4 between measurements and forecast, reinforce the validity of the computation methods and models used for the long term evaluation of the radiation levels (flux and dose) encountered in space on low inclination and altitude Earth orbits. ABSORBED DOSE MEASUREMENTS AND PREDICTIONS ON LDEF **c72**
A. L. Frank, E. V. Benton, T. W. Armstrong (Science Applications International Corp., Prospect, TN.), and B. L. Colborn (Science Applications International Corp., Prospect, TN.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 163-170 (For primary document see N93-29621 11-99)
(Contract NAS8-38610)
Avail: CASI HC A02/MF A03

The overall radiation environment of the Long Duration Exposure Facility (LDEF) was determined in part through the use of thermoluminescent detectors (TLD's) which were included in several experiments. The results given are from four experiments (A0015 Biostack, M0004 Fiber Optics Data Link, P0004 Seeds in Space, and P0006 Linear Energy Transfer Spectrum Measurement) and represent a large fraction of existing absorbed dose data. The TLD's were located on the leading and the trailing edges and the Earth end of the spacecraft under various shielding depths (0.48 to 15.4 g/sq cm). The measured absorbed doses were found to reflect both directional dependence of incident trapped protons and shielding. At the leading edge, doses ranged from 2.10 to 2.58 Gy under shielding of 2.90 to 1.37 g/sq cm Al equivalent (M0004). At the trailing edge, doses varied from 3.04 to 4.49 Gy under shielding of 11.7 to 3.85 g/sq cm (A0015), doses varied from 2.91 to 6.64 Gy under shielding of 11.1 to 0.48 g/sq cm (P0004), and a dose range of 2.66 to 6.48 Gy was measured under shielding of 15.4 to 0.48 g/sq cm (P0006). At the Earth end of the spacecraft, doses from 2.41 to 3.93 Gy were found under shielding of 10.0 to 1.66 g/sq cm (A0015). The effect of the trapped proton anisotropy was such that the western side of LDEF received more than 2 times the dose of the eastern side at shielding depths of approximately 1 g/sq cm. Calculations utilizing a directional model of trapped proton spectra predict smaller doses than those measured, being about 50 percent of measured values at the trailing edge and Earth end, and about 80 percent near the leading edge. Avail: CASI HC A02/MF A03

Measurements are under way of the charged particle radiation environment of the Long Duration Exposure Facility (LDEF) satellite using stacks of plastic nuclear track detectors (PNTD's) placed in different locations of the satellite. In the initial work the charge, energy, and linear energy transfer (LET) spectra of charged particles were measured with CR-39 double layer PNTD's located on the west side of the satellite (Experiment P0006). Primary and secondary stopping heavy ions were measured separately from the more energetic particles. Both trapped and galactic cosmic ray (GCR) particles are included, with the latter component being dominated by relativistic iron particles. The results from the P0006 experiment will be compared with similar measurements in other locations on LDEF with different orientation and shielding conditions. The remarkably detailed investigation of the charged particle radiation environment of the LDEF satellite will lead to a better understanding of the radiation environment of the Space Station Freedom. It will enable more accurate prediction of single event upsets (SEU's) in microelectronics and, especially, more accurate assessment of the risk - contributed by different components of the radiation field (GCR's, trapped protons, secondaries and heavy recoils, etc.) - to the health and safety of crew members. LIGHT-HEAVY ION MEASUREMENTS IN CR-39 LOCATED ON THE EARTH SIDE OF LDEF **c72**
I. Csige, E. V. Benton, S. Soundararajan, and E. R. Benton *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium 181-186 (SEE N93-29621 11-99) Apr. 1993 (For primary document see N93-29621 11-99)
(Contract NAS8-38610)
Avail: CASI HC A03/MF A03

The azimuthal angle distribution and the charge and energy spectra of selected light-heavy (5 less than or equal to Z less than or equal to 8) stopping particles were measured in a single layer of CR-39 plastic nuclear track detector (PNTD) from the stack of the A0015 experiment located on the Earth-end of the LDEF satellite. The directional incidence of the trapped protons is studied by comparing the azimuthal angle distribution of selected recoils, obtained in the LDEF detectors, to that obtained through calibrations of PNTD's with exposures performed with 200 MeV proton beams from different directions. (Grant NAG8-168)
Avail: CASI HC A02/MF A03

Three-dimensional shielding effects on cosmic ray charged particle fluences were measured with plastic nuclear track detectors in the P0006 experiment on Long Duration Exposure Facility (LDEF). The azimuthal and polar angle distributions of the galactic cosmic ray particles (mostly relativistic iron) were measured in the main stack and in four side stacks of the P0006 experiment, located on the west end of the LDEF satellite. A shadowing effect of the shielding of the LDEF satellite is found. Total fluence of stopping protons was measured as a function of the position in the main and side stacks of the P0006 experiment. Location dependence of total track density is explained by the three-dimensional shielding model of the P0006 stack. These results can be used to validate 3D mass model and transport code calculations and also for predictions of the outer radiation environment for the Space Station Freedom. Author (revised)

Predictions and comparisons with the radiation dose measurements on Long Duration Exposure Facility (LDEF) by thermoluminescent dosimeters were made to evaluate the accuracy of models currently used in defining the ionizing radiation environment for low Earth orbit missions. The calculations include a detailed simulation of the radiation exposure (altitude and solar cycle variations, directional dependence) and shielding effects (three-dimensional LDEF geometry model) so that differences in the predicted and observed doses can be attributed to environment model uncertainties. The LDEF dose data are utilized to assess the accuracy of models describing the trapped proton flux, the trapped proton directionality, and the trapped electron flux. Author (revised)

PROGRESS REPORT ON THE HEAVY IONS IN SPACE (HIIS) EXPERIMENT **c72**
James H. Adams, Jr., Lorraine P. Beahm, Paul R. Boberg, and Allan J. Tylka *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium Apr. 1993 p 247-259 (For primary document see N93-29621 11-99)
Avail: CASI HC A03/MF A03

One of the objectives of the Heavy Ions In Space (HIIS) experiment is to investigate heavy ions which appear at Long Duration Exposure Facility (LDEF) below the geomagnetic cutoff for fully-ionized galactic cosmic rays. Possible sources of such 'below-cutoff' particles are partially-ionized solar energetic particles, the anomalous component of cosmic rays, and magnetospherically-trapped particles. In recent years, there have also been reports of below-cutoff ions which do not appear to be from any known source. Although most of these observations are based on only a handful of ions, they have led to speculation about 'partially-ionized galactic cosmic rays' and 'near-by cosmic ray sources'. The collecting power of HIIS is order of magnitude larger than that of the instruments which reported these results, so HIIS should be able to confirm these observations and perhaps discover the source of these particles. Preliminary results on below-cutoff heavy-ions are reported. Observations to possible known sources of such ions are compared. A second objective of the HIIS experiment is to measure the elemental composition of ultraheavy galactic cosmic rays, beginning in the tin-barium region of the periodic table. A report on the status of this analysis is presented. Author (revised)

Avail: CASI HC A02/MF A03

The Ultra Heavy Cosmic Ray Experiment (UHCRE) is based on a modular array of 192 side-viewing solid state nuclear track detector stacks. These stacks were mounted in sets of four in 48 pressure vessels employing sixteen peripheral Long Duration Exposure Facility (LDEF) trays. The extended duration of the LDEF mission has resulted in a greatly enhanced scientific yield from the UHCRE. The geometry factor for high energy cosmic ray nuclei, allowing for Earth shadowing, was 30 sq m-sr, giving a total exposure factor of 170 sq m-sr-y at an orbital inclination of 28.4 degrees. Scanning results indicate that about 3000 cosmic ray nuclei in the charge region with Z greater than 65 were collected. This sample is more than ten times the current world data in the field (taken to be the data set from the HEAO-3 mission plus that from the Ariel-6 mission) and is sufficient to provide the world's first statistically significant sample of actinide (Z greater than 88) cosmic rays. Results to date are presented including details of ultra-heavy cosmic ray nuclei, analysis of pre-flight and post-flight calibration events and details of track response in the context of detector temperature history. The integrated effect of all temperature and age related latent track variations cause a maximum charge shift of +/- 0.8 e for uranium and +/- 0.6 e for the platinum-lead group. The precision of charge assignment as a function of energy is derived and evidence for remarkably good charge resolution achieved in the UHCRE is considered. Astrophysical implications of the UHCRE charge spectrum are discussed. Author (revised)

Avail: CASI HC A03/MF A03; 2 functional color pages

The Long Duration Exposure Facility (LDEF) carried a remarkable variety of electrical, mechanical, thermal, and optical systems, subsystems, and components. Nineteen of the fifty-seven experiments flown on LDEF contained functional systems that were active on-orbit. Almost all of the other experiments possessed at least a few specific components of interest to the Systems Special Investigation Group (Systems SIG), such as adhesives, seals, fasteners, optical components, and thermal blankets. Almost all top level functional testing of the active LDEF and experiment systems has been completed. Failure analysis of both LDEF hardware and individual experiments that failed to perform as designed has also been completed. Testing of system components and experimenter hardware of interest to the Systems SIG is ongoing. All available testing and analysis results were collected and integrated by the Systems SIG. An overview of our findings is provided. An LDEF Optical Experiment Database containing information for all 29 optical related experiments is also discussed.

POST-FLIGHT ANALYSES OF THE CRYSTALS FROM THE M0003-14 QUARTZ CRYSTAL MICROBALANCE EXPERIMENT **c76**
W. K. Stuckey, G. Radhakrishnan, and D. Wallace (QCM Research, Laguna Beach, CA.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1269-1283 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

Quartz Crystal Microbalances constructed by QCM Research were flown on the leading and trailing edges of LDEF as one of the sub-experiments of M0003. Response of the crystals coated with 150 A of In2O3 was recorded during the first 424 days of the mission. A second QCM with crystals coated with 150 A of ZnS was also flown but not monitored. After the flight, the QCM's were disassembled and analyzed in The Aerospace Corporation laboratories. The samples included the crystals from the leading and trailing edge samples of both types of coatings along with the reference crystals, which were inside the QCM housing. Analyses were performed by scanning electron microscopy, energy dispersive x-ray analyses, x-ray photoelectron spectroscopy, ion microprobe mass analysis, and reflectance spectroscopy in the infrared and UV/visible regions. The crystals are contaminated predominantly with silicone compounds. The contamination is higher on the leading edge than on the trailing edge and higher on the exposed crystals than on the reference crystals. Author (revised)

RADIATION SENSITIVITY OF QUARTZ CRYSTAL OSCILLATORS EXPERIMENT FOR THE LONG DURATION EXPOSURE FACILITY (LDEF), PART 2 **c33**
J. S. Ahearn and J. D. Venables *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1285-1289 (For primary document see N93-29682 11-99)
Avail: CASI HC A01/MF A03; 2 functional color pages

The stability of high precision quartz crystal oscillators exposed to the radiation environment of NASA's Long Duration Exposure Facility (LDEF) was studied. Comparisons between pre-flight and post-flight frequency drift rates indicate that oscillators made from swept premium Q quartz exhibited a significantly greater post-flight drift rate than before exposure, but that the effect annealed after five months aging at 75 C (the operating temperature). The result that six years worth of radiation damage annealed out in less than six months suggests that if the oscillators had been powered during the LDEF mission, no net change in drift rate beyond their normal baseline value would have occurred. THE EFFECT OF THE LOW EARTH ORBIT ENVIRONMENT ON SPACE SOLAR CELLS: RESULTS OF THE ADVANCED PHOTOVOLTAIC EXPERIMENT (S0014) **c44**

David J. Brinker, John R. Hickey (Eppley Lab., Inc., Newport, RI.), and David A. Scheiman (Sverdrup Technology, Inc., Brook Park, OH.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1291-1302 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

The results of post-flight performance testing of the solar cells flown on the Advanced Photovoltaic Experiment are reported. Comparison of post-flight current-voltage characteristics with similar pre-flight data revealed little or no change in solar cell conversion efficiency, confirming the reliability and endurance of space photovoltaic cells. This finding is in agreement with the lack of significant physical changes in the solar cells despite nearly six years in the low Earth orbit environment. Author

LEO EFFECTS ON CANDIDATE SOLAR CELL COVER MATERIALS **c44**

Paul M. Stella *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1303-1313 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

In 1984, the LDEF (Long Duration Exposure Facility) was placed in LEO (Low Earth Orbit) for a mission planned to last approximately one year. Due to a number of factors, retrieval was delayed until 1990. An experiment, prepared under the direction of JPL, consisted of a test plate with thirty (30) individual thin silicon solar cell/cover samples. The covers consisted of conventional cerium doped microsheet platelets and potential candidate materials, such as FEP Teflon, silicon RTV's, glass resins, polyimides, and a silicone-polyimide copolymer encapsulant. The effects of the LDEF mission environment (micrometeorite/debris impacts, atomic oxygen, UV, and particulate radiation) on the samples are discussed. Author (revised)

NEW RESULTS FROM FRECOPA ANALYSIS **c37**

Christian Durin *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1315-1331 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

New results from the ongoing analysis of the FRECOPA's (FREnch COoperative PAssive payload) system hardware are discussed. FRECOPA (AO138) was one of the 57 experiments flown on the LDEF satellite. The experiment was located on the trailing edge (Tray B3) and was exposed to UV radiation (11,100 equivalent sun hours), approximately equal to 34,000 thermal cycles, higher vacuum levels than the leading edge, a low atomic oxygen flux, and minor doses of protons and electrons. Due to LDEF's extended mission (5.8 years), CNES decided to set up a team to analyze the FRECOPA system. Initial results were presented at the First Post-Retrieval Conference, June, 1991. The results obtained since then are summarized. Author (revised)

DEGRADATION OF ELECTRO-OPTIC COMPONENTS ABOARD LDEF **c74**

M. D. Blue *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1333-1342 (For primary document see N93-29682 11-99)
Avail: CASI HC A02/MF A03; 2 functional color pages

Remeasurement of the properties of a set of electro-optic components exposed to the low-earth environment aboard the Long Duration Exposure Facility (LDEF) indicates that most components survived quite well. Typical components showed some effects related to the space environment unless well protected. The effects were often small but significant. Results for semiconductor infrared detectors, lasers, and LED's, as well as filters, mirrors, and black paints are described. Semiconductor detectors and emitters were scarred but reproduced their original characteristics. Spectral characteristics of multi-layer dielectric filters and mirrors were found to be altered and degraded. Increased absorption in black paints indicates an increase in absorption sites, giving rise to enhanced performance as coatings for baffles and sunscreens. Author

LDEF SPACE PLASMA-HIGH VOLTAGE DRAINAGE EXPERIMENT POST-FLIGHT RESULTS **c33**

J. Y. Yaung, B. K. Blakkolb, W. C. Wong, L. E. Ryan, H. J. Schurig, and W. W. L. Taylor *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1343-1354 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

The Space Plasma-High Voltage Drainage Experiment (SP-HVDE) was comprised of two identical experimental trays. With one tray located on the leading (ram facing, B10) edge and the other located on the trailing (wake facing, D4) edge of the Long Duration Exposure Facility (LDEF), it was possible to directly compare the effects of ram and wake spacecraft environments on charged dielectric materials. Six arrays of Kapton dielectric samples of 2 mil, 3 mil, and 5 mil thicknesses maintained at +/- 300, +/- 500, and +/- 1000 voltage bias formed the experimental matrix of each tray. In addition, each tray carried two solar cell strings, one biased at +300 volts and the other at -300 volts, to study current leakage from High Voltage Solar Arrays (HVSA). The SP-HVDE provides the first direct, long-term, in-flight measurements of average leakage current through dielectric materials under electric stress. The experiment also yields information on the long term stability of the bulk dielectric properties of such materials. Data and findings of the SP-HVDE are an extension of those from shorter term flight experiments such as the PIX-1 (Plasma Interaction Experiment) and PIX-2 and are therefore valuable in the design and evaluation of long-lived space systems with high voltage systems exposed to the low earth orbital environment. A summary of the SP-HVDE post flight analysis final report delivered to the LDEF Project Office under contract to the National Aeronautics and Space Administration is presented. Author (revised)

IN ORBIT DEGRADATION OF EUV OPTICAL COMPONENTS IN THE WAVELENGTH RANGE 10-40 nm AO 138-3 **c74**

J. P. Delaboudiniere, C. Carabetian, and J. F. Hochedez *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1355-1360 Sponsored in part by CNES (For primary document see N93-29682 11-99)
Avail: CASI HC A02/MF A03; 2 functional color pages

A complement of EUV optical components, including mirrors and thin film filters, was flown as part of the Long Duration Exposure Facility (LDEF) AO 138-3. The most original amongst these components were multilayered interference reflectors for the 10-40 nm wavelength range. Very moderate degradation was observed for those components which were exposed to the sun. The degradation is compatible with the deposition of a few nanometers of absorbing material on the surface of the samples. Author

document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

Phillips Laboratory's Long Duration Exposure Facility (LDEF) optical experiment is designed to determine the adverse effects of the natural space environment on laser optical component and coating materials. The experiment consists of 10 sample sets, each containing six different material samples. The materials were chosen because of their common use in laser optical components. Sample characterization is divided into three phases. Phase 1 testing is limited to visual and optical performance evaluation. Phase 2 tests investigate the fundamental causes of the performance degradation quantified in Phase 1. During Phase 3, selected samples will be cleaned and some Phase 1 measurements repeated to determine if acceptable optical performance can be restored, and laser damage testing will be performed on a small number of samples. Performance deteriorations will be correlated to exposure duration, sample location on the LDEF, atomic oxygen levels, and other space environment conditions. Preliminary results obtained on the optical samples are discussed. Author (revised)

EFFECTS OF LONG TERM SPACE ENVIRONMENT EXPOSURE ON OPTICAL SUBSTRATES AND COATINGS (S0050-2) **c74**

Keith Harvey, Arthur Mustico, and John Vallimont *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1389-1397 (For primary document see N93-29682 11-99)
Avail: CASI HC A02/MF A03; 2 functional color pages

Eastman Kodak Company included twelve substrate and coating samples on the Long Duration Exposure Facility (LDEF) structure. There were three Fused Silica and three Ultra Low Expansion (ULE) uncoated glass samples, two ULE samples with a high reflectance silver coating, two Fused Silica samples with an antireflectance coating, and two Fused silica samples with a solar rejection coating. A set of duplicate control samples was also manufactured and stored in a controlled environment for comparison purposes. Kodak's samples were included as a subset of the Georgia Institute of Technology tray, which was located on row 5-E, tray S0050-2. This placed the samples on the trailing edge of the structure, which protected them from the effects of atomic oxygen bombardment. An evaluation of the flight samples for effects from the 5 year mission showed that a contaminant was deposited on the samples, a micrometeoroid impact occurred on one of the samples, and the radiation darkening which was expected for the glass did not occur. The results are listed in more detail. Author

LDEF SPACE OPTICS HANDBOOK Abstract Only **c74**

Robert J. Champetier, Dale R. Atkinson (POD Associates, Inc., Albuquerque, NM.), and William T. Kemp (Phillips Lab., Kirtland AFB, NM.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1399 (For primary document see N93-29682 11-99)
Avail: CASI HC A01/MF A03; 2 functional color pages

There is a need to present design guidelines derived from the Long Duration Exposure Facility (LDEF) space optics experiments to hardware designers. In response to this need a small study program was just started by SAIC and POD Associates for the Phillips Laboratory. The objective is to prepare a top-level review of available results on the behavior of certain optical components in the LDEF space experiments. The optics interest centers on optical surfaces and coatings, and fabrication processes for laser windows and mirrors. The program has two main parts: the first phase, to be completed by the end of 1992, consists of identifying and acquiring data from the appropriate investigators. The second phase, ending in December 1993, comprises report preparation as well as selected, prioritized, additional characterization of certain samples, coordinated with the principal investigators and the Phillips Laboratory. This program is getting under way at the time of the Symposium and does not warrant more than the present summary at this time. Author (revised)

RULED AND HOLOGRAPHIC EXPERIMENT (AO 138-5) Abstract Only **c35**

Francis Bonnemason *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1401 (For primary document see N93-29682 11-99)
Avail: CASI HC A01/MF A03; 2 functional color pages

The AO 138-5 experiment was designed, via the FRECOPA (FRench COoperative PAyload) experiment with the aim to study the optical behavior of different diffraction gratings submitted to space vacuum long exposure and solar irradiation. Samples were ruled and holographic gratings, masters or replica, and some additional control mirrors with various coatings. The experiment was located on the B3, trailing edge of the LDEF and was protected against Atomic Oxygen flux. The experienced thermal cycling was evaluated from -23 C to 66 C during the flight, 34,000 orbits. The samples (two batches of four pieces) were located on a dedicated plate, by a pair of equivalent gratings or mirrors; optical faces were located on the external side. The plate was inside a canister, which had been opened in space for ten months. When the satellite returned to Kennedy Space Center, the remaining vacuum in the canister was still correct. The analysis focused on the triple point characterization including light efficiency, wavefront flatness quality and stray light level. Tests were conducted on control mirrors and gratings (rules and holographic master or replica) loaded but not exposed to cosmic dust or direct solar irradiations. They did not show any significant variations. Solar exposure had damaged the coating (aluminum and platinum) reflectivity in the Ultra-Violet region; the degradation is higher with the gratings, in terms of efficiency. However, wavefront flatness quality and stray light level tests revealed no additional changes. Author

ANALYSES OF SPACE ENVIRONMENT EFFECTS ON ACTIVE FIBER OPTIC LINKS ORBITED ABOARD THE LDEF c74

Edward W. Taylor, T. W. Monarski, J. N. Berry, A. D. Sanchez, R. J. Padden, and S. P. Chapman *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1425-1437 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

The results of the 'Preliminary Analysis of WL Experiment no. 701, Space Environment Effects on Operating Fiber Optic Systems,' is correlated with space simulated post retrieval terrestrial studies performed on the M0004 experiment. Temperature cycling measurements were performed on the active optical data links for the purpose of assessing link signal to noise ratio and bit error rate performance some 69 months following the experiment deployment in low Earth orbit. The early results indicate a high correlation between pre-orbit, orbit, and post-orbit functionality of the first known and longest space demonstration of operating fiber optic systems. Author (revised)

RADIATION AND TEMPERATURE EFFECTS ON LDEF FIBER OPTIC SAMPLES c74

A. R. Johnston, R. Hartmayer, and L. A. Bergman *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1439-1453 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

Results obtained from the JPL Fiber Optics Long Duration Exposure Facility (LDEF) Experiment since the June 1991 Experimenters' Workshop are addressed. Radiation darkening of laboratory control samples and the subsequent annealing was measured in the laboratory for the control samples. The long-time residual loss was compared to the LDEF flight samples and found to be in agreement. The results of laboratory temperature tests on the flight samples, extending over a period of about nine years, including the pre-flight and post-flight analysis periods, are described. The temperature response of the different cable samples varies widely, and appears in two samples to be affected by polymer aging. Conclusions to date are summarized. Author (revised)

LONG DURATION EXPOSURE FACILITY (LDEF) LOW TEMPERATURE HEAT PIPE EXPERIMENT PACKAGE (HEPP) FLIGHT RESULTS c34

Roy McIntosh, Craig McCreight (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, CA.), and Patrick J. Brennan (OAO Corp., Greenbelt, MD.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1455-1475 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

The Low Temperature Heat Pipe Flight Experiment (HEPP) is a fairly complicated thermal control experiment that was designed to evaluate the performance of two different low temperature ethane heat pipes and a low-temperature (182 K) phase change material. A total of 390 days of continuous operation with an axially grooved aluminum fixed conductance heat pipe and an axially grooved stainless steel heat pipe diode was demonstrated before the data acquisition system's batteries lost power. Each heat pipe had approximately 1 watt applied throughout this period. The HEPP was not able to cool below 188.6 K during the mission. As a result, the preprogrammed transport test sequence which initiates when the PCM temperature drops below 180 K was never exercised, and transport tests with both pipes and the diode reverse mode test could not be run in flight. Also, because the melt temperature of the n-heptane PCM is 182 K, its freeze/thaw behavior could not be tested. Post-flight thermal vacuum tests and thermal analyses have indicated that there was an apparent error in the original thermal analyses that led to this unfortunate result. Post-flight tests have demonstrated that the performance of both heat pipes and the PCM has not changed since being fabricated more than 14 years ago. A summary of HEPP's flight data and post-flight test results are presented. Author (revised)

FINAL RESULTS OF SPACE EXPOSED EXPERIMENT DEVELOPED FOR STUDENTS c51

Doris K. Grigsby *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1479-1492 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

SEEDS was a cooperative endeavor of NASA Headquarters, the NASA Langley Research Center, and the George W. Park Seed Company. Approximately 132,000 SEEDS kits containing Rutger's tomato seeds that had flown on LDEF, as well as similar seeds that had been stored in a climate-controlled warehouse for the same time period, were sent to schools in every state and 30 foreign countries. Student researchers from kindergarten through university compared germination and growth characteristics of the space-exposed and Earth-based seeds and returned data to NASA for analysis. Important scientific information was gained as students reported very little difference between the two seed groups. Author (revised)

CONTINUED RESULTS OF THE SEEDS IN SPACE EXPERIMENT c51

Jim A. Alston *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1493-1497 (For primary document see N93-29682 11-99)
Avail: CASI HC A01/MF A03; 2 functional color pages

Two million seeds of 120 different varieties representing 106 species, 97 genera, and 55 plant families were flown aboard the Long Duration Exposure Facility (LDEF). The seed were housed on the Space Exposed Experiment Developed for Students (SEEDS) tray in the sealed canister number 6 and in two small vented canisters. The tray was in the F-2 position. The seed were germinated and the germination rates and the development of the resulting plants were compared to the performance of the control seed that stayed in Park Seed's seed storage facility. The initial results were presented in a paper at the First LDEF Post-Retrieval Symposium. There was a better survival rate of the seed in the sealed canister in space than in the storage facility at Park Seed. At least some of the seed in each of the vented canisters survived the exposure to vacuum for almost six years. The number of observed apparent mutations was very low. In the initial testing, the small seeded crops were not grown to maturity to check for mutations and obtain second generation seed. These small seeded crops have now been grown for evaluation and second generation seed collected. Author

LDEF ARCHIVAL SYSTEM PLAN c82

Brenda K. Wilson *In* NASA. Langley Research Center, LDEF: 69 months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1499-1509 (For primary document see N93-29682 11-99)
Avail: CASI HC A03/MF A03; 2 functional color pages

The Long Duration Exposure Facility (LDEF) has provided the first significant opportunity to extensively study the space environment and its effects upon spacecraft systems and materials. The long-term value of the data obtained from LDEF, which is applicable to a wide range of areas including space environment definition, space environmental effects, and spacecraft design, will depend upon the system developed to archive and retrieve the data. Therefore, in addition to the large effort undertaken to analyze LDEF data, a substantial effort is also necessary in order to retain and disseminate LDEF resources for future research and design. W. J. Schafer Associates, Inc., has a task subcontract to develop the LDEF archival system. The LDEF resources include data, hardware, photographic records, and publications which cover the 20-year history of LDEF from concept design through data analysis. Chronologically, prelaunch resources include documentation of facility and experiment development, testing integration, and operation. Post-retrieval resources are the observations, testing, analysis, and publications since the January 1990 retrieval of LDEF. A third set of resources is the experiment and facility hardware and specimens, including more than 10,000 test specimens flown on LDEF and subsequently divided and distributed among investigators at numerous laboratories. Many valuable science and technology investigations were undertaken with LDEF experiments and hardware, and many more investigations are being identified in areas not yet explored. LDEF data applications encompass primarily low-Earth orbit spacecraft and structures. The nearly six-year space exposure of LDEF has provided data to evaluate materials, systems, and living specimens exposed to radiation, meteoroids, debris, and other constituents of the low-Earth environment. Structural, mechanical, electrical, optical, and thermal systems were studied, and materials with applications in all aspects of space systems were exposed to the space environment. The objectives of the LDEF archival system are to maintain the existing LDEF hardware, data, analysis, publications, and photographs as a long term resource, and to provide a quick and simple mechanism by which LDEF resources can be identified, located, and applied. Author (revised)

RETRIEVABLE PAYLOAD CARRIER, NEXT GENERATION LONG DURATION EXPOSURE FACILITY: UPDATE 1992 **c18**

A. T. Perry, J. A. Cagle, and S. C. Newman *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1511-1520 (For primary document see N93-29682 11-99)

Avail: CASI HC A02/MF A03; 2 functional color pages

Access to space and cost have been two major inhibitors of low Earth orbit research. The Retrievable Payload Carrier (RPC) Program is a commercial space program which strives to overcome these two barriers to space experimentation. The RPC Program's fleet of spacecraft, ground communications station, payload processing facility, and experienced integration and operations team will provide a convenient 'one-stop shop' for investigators seeking to use the unique vantage point and environment of low Earth orbit for research. The RPC is a regularly launched and retrieved, free-flying spacecraft providing resources adequate to meet modest payload/experiment requirements, and presenting ample surface area, volume, mass, and growth capacity for investigator usage. Enhanced capabilities of ground communications, solar-array-supplied electrical power, central computing, and on-board data storage pick up on the path where NASA's Long Duration Exposure Facility (LDEF) blazed the original technology trail. Mission lengths of 6-18 months, or longer, are envisioned. The year 1992 was designated as the 'International Space Year' and coincides with the 500th anniversary of Christopher Columbus's voyage to the New World. This is a fitting year in which to launch the full scale development of our unique shop of discovery whose intent is to facilitate retrieving technological rewards from another new world: space. Presented is an update on progress made on the RPC Program's development since the November 1991 LDEF Materials Workshop. Author (revised)

NEXT GENERATION OPTICAL INSTRUMENTS AND SPACE EXPERIMENT BASED ON THE LDEF THERMAL CONTROL SURFACES EXPERIMENT (S0069) **c74**

Donald R. Wilkes *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1521-1533 (For primary document see N93-29682 11-99)

Avail: CASI HC A03/MF A03; 2 functional color pages

The Thermal Control Surfaces Experiment (TCSE) was a successful experiment to study the effects of the space environment on thermal control surfaces using in-space optical properties measurements combined with post-flight analyses. The TCSE reflectometer performed well on the LDEF mission demonstrating that a portable compact integrating sphere spectroreflectometer can be built that is rugged and space rated. Since the retrieval of the TCSE package from space, several other instruments have evolved from its pioneering technologies. These are the Optical Properties Monitor (OPM), the Laboratory Portable SpectroReflectometer (LPSR), and the Space Portable SpectroReflectometer (SPSR). These instruments and experiment packages are described. Author (revised)

AN LDEF 2 DUST INSTRUMENT FOR DISCRIMINATION BETWEEN ORBITAL DEBRIS AND NATURAL PARTICLES IN NEAR-EARTH SPACE **c19**

A. J. Tuzzolino, J. A. Simpson, R. B. McKibben, H. D. Voss (Lockheed Missiles and Space Co., Palo Alto, CA.), and H. Gursky (Naval Research Lab., Washington, DC.) *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1535-1549 Sponsored in part by Lockheed Missiles and Space Co. (For primary document see N93-29682 11-99)

(Contract NAGw-3078; N00014-91-J-1716)

Avail: CASI HC A03/MF A03; 2 functional color pages

The characteristics of a space dust instrument which would be ideally suited to carry out near-Earth dust measurements on a possible Long Duraction Exposure Facility reflight mission (LDEF 2) is discussed. As a model for the trajectory portion of the instrument proposed for LDEF 2, the characteristics of a SPAce DUSt instrument (SPADUS) currently under development for flight on the USA ARGOS mission to measure the flux, mass, velocity, and trajectory of near-Earth dust is summarized. Since natural (cosmic) dust and man-made dust particles (orbital debris) have different velocity and trajectory distributions, they are distinguished by means of the SPADUS velocity/trajectory information. The SPADUS measurements will cover the dust mass range approximately 5 x 10(exp -12) g (2 microns diameter) to approximately 1 x 10(exp -5) g (200 microns diameter), with an expected mean error in particle trajectory of approximately 7 deg (isotropic flux). Arrays of capture cell devices positioned behind the trajectory instrumentation would provide for Earth-based chemical and isotopic analysis of captured dust. The SPADUS measurement principles, characteristics, its role in the ARGOS mission, and its application to an LDEF 2 mission are summarized. Author (revised)

FUTURE RADIATION MEASUREMENTS IN LOW EARTH ORBIT **c93**

James H. Adams, Jr. *In* NASA. Langley Research Center, LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium Apr. 1993 p 1551-1561 (For primary document see N93-29682 11-99)

Avail: CASI HC A03/MF A03; 2 functional color pages

The first Long Duration Exposure Facility (LDEF) mission has demonstrated the value of the LDEF concept for deep surveys of the space radiation environment. The kinds of measurements that could be done on a second LDEF mission are discussed. Ideas are discussed for experiments which: (1) capitalize on the discoveries from LDEF 1; (2) take advantage of LDEF's unique capabilities; and (3) extend the investigations begun on LDEF 1. These ideas have been gleaned from investigators on LDEF 1 and others interested in the space radiation environment. They include new approaches to the investigation of Be-7 that was discovered on LDEF 1, concepts to obtain further information on the ionic charge state of cosmic rays and other energetic particles in space and other ideas to extend the investigations begun on LDEF 1. DECISION MAKER'S GUIDE TO INTERNATIONAL SPACE

Robert Usher and Donald Blersch 1993 159 p

(Anser-STDN-93-4) Avail: CASI HC A08/MF A02

ANSER maintains an extensive knowledge base on international space activities. As part of its Independent Research and Development activities (IR&D), ANSER has developed an infrastructure that tracks the space development activities of more than 60 countries. Direct contact with foreign space officials and organizations provides a unique, steady flow of primary source data that is used in conjunction with data from open sources. The Decision Maker's Guide to International Space documents the highlights of ANSER's knowledge base in an easy-to-use reference book that provides top-level data in a uniform structure. The Guide is intended as a resource for senior-level US Government officials. As such, the format is kept concise for quick information retrieval and comparisons. Overall sources of information are cited at the end of the book, and current year budget figures are cited in individual country sections. While a rigorous footnoting system was not adopted, ANSER maintains this detailed level of data tracking as a feature within the International Space Capabilities Information System (ISCIS) database that supports publication of the Guide. The goal of this reference is to provide an accurate, standardized, functional guide to international space activities. For more rigorous investigations, ANSER currently uses its established knowledge base to perform in-depth analyses in a variety of international space areas and stands ready to meet additional needs of the US Government. INTERAGENCY ADVANCED POWER GROUP (IAPG) MEETING COMPENDIUM

Jan. 1993 130 p Symposium held in Alexandria, VA, 31 Mar. - 2 Apr. 1992

(Contract DE-AC01-90CE-90053)

(DE93-006189; CONF-920384-Summ) Avail: CASI HC A07/MF A02

Under the direction of the Interagency Advanced Power Group (IAPG), the Power Information Center (PIC) provides support services for each IAPG information exchange session. IAPG members meet a minimum of once each year to share programmatic and technical information on federally funded research and development (R&D) projects in the area of advanced power. This R&D is directed by one of the five IAPG member agencies-the US Army, US Navy, US Air Force, US Department of Energy, and the National Aeronautics and Space Administration. Affiliated federal groups and federally funded research and development centers can also participate. To enhance the exchange of information between government researchers, this 1992 IAPG Meeting Compendium has been assembled. This publication is a re-printing of abstracts of each IAPG presentation offered during 1991-1992. The information is arranged chronologically by IAPG meeting. During the 1992 IAPG meeting year, there were presentations restricted to government audiences only. These 'restricted' minutes have not been included in this compilation. DOE

AFOSR STATUS REPORT Quarterly Status Report, Jan. - Mar. 1993

Apr. 1993 92 p

(AD-A264720; AFOSR-93-0340TR) Avail: CASI HC A05/MF A01

The Research Proposal Quarterly Status Report is published in March, June, September, and December by the Air Force Office of Scientific Research (AFOSR). It lists all the research proposals received by AFOSR in the previous six months along with the action taken (Initiated, Declined, or Withdrawn) on each report. The report is divided into two parts. The Institution index lists proposals alphabetically by institution. This is followed by a more detailed listing by Directorate, and by Program Manager within the Directorate. This report is designed to inform other government sponsoring agencies of the proposals received by the AFOSR and the action taken on these proposals. Readers must keep in mind that declined proposals should not necessarily be special programmatic emphasis. DTIC

SCIENTIFIC RESEARCH ABSTRACTS IN THE REPUBLIC OF CHINA, 1991 (SCIENCE AND TECHNOLOGY)

Dec. 1992 1823 p

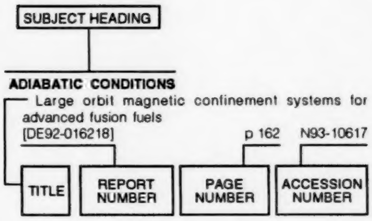
Avail: CASI HC A99/MF A10

In order to meet the information needs of science and technology research in the country, reduce unwarranted repetition of research projects, and introduce the country's R&D activities to the international science and technology community, Science and Technology Information Center (STIC) compiles annually a set of abstracts as an effort to enlist all research projects completed in the year of interest. For the information to be comprehensive in scope, STIC collects data from all possible sources within the Republic of China, including research institutions, universities, and privately-funded laboratories. For the calendar year of 1991, entries covering all fields of Science and Technology are provided. Derived from text

SUBJECT INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 31 NUMBER 11

Typical Subject Index Listing



SUBJECT HEADING
ADIABATIC CONDITIONS
Large orbit magnetic confinement systems for advanced fusion fuels
[DE92-016218] p 162 N93-10617
TITLE
REPORT NUMBER
PAGE NUMBER
ACCESSION NUMBER

The subject heading is a key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The page number helps you locate the citation in the abstract section. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus*.

A

A STARS
Precision optical interferometry in space
[NASA-CR-193264] p 3630 N93-29163

ABLATION
Altitude compensating ablative stiffening band for rocket motor nozzles
[NASA-CASE-MFS-28728-1] p 3288 N93-28950
Ablative shielding for hypervelocity projectiles
[NASA-CASE-MSC-21884-1] p 3331 N93-29088
Ablation problems using a finite control volume technique
[DE93-009861] p 3549 N93-29187

ABNORMALITIES
Energetic material response to abnormal environments p 3350 N93-30095

ABSORBENTS
Be3(AsO4)2 2H2O: A new berylloarsenate phase containing bridged tetrahedral 3-rings
[AD-A262518] p 3592 N93-28584
The synthesis and ab initio structure determination of Zn4O(BO3)2: A microporous zincoborate built up from fused 3-ring and 5-ring sub-units
[AD-A262504] p 3594 N93-29138
Ordered molecular arrays as templates: A new approach to synthesis of mesoporous materials
[AD-A264631] p 3570 N93-30540

ABSORBERS (MATERIALS)
Formulation of Ames 24E2 IR-black coating
[NASA-TM-102864] p 3629 N93-29453

ABSORPTION
A Fokker-Planck operator for the emission and absorption of electron plasma waves in a magnetized plasma
[DE93-009579] p 3584 N93-28598
Acid gas treating by aqueous alkanolamines
[PB93-176188] p 3471 N93-29676

ABSORPTION SPECTRA
Tomographic analysis of line-of-sight infrared spectra of low-pressure flames
[AD-A263185] p 3309 N93-28514
Microtextured metals for stray-light suppression in the Clementine startracker p 3286 N93-28785
Examination of shock induced chemical reactions in liquids using time-resolved optical spectroscopy
p 3318 N93-30073
Condensed phase diagnostics of nitramine propellant combustion p 3320 N93-30102
A novel flame thermometer based on the doppler width of ro-vibrational transitions
[AD-A264515] p 3315 N93-30405
A correlated k-distribution model of the atmospheric heating rates for overlapping spectra of CO2 and H2O
[DE93-007391] p 3474 N93-30504
Pulsed laser photoacoustic spectrometer for study of solid materials
[DE93-605290] p 3441 N93-31023

ABSORPTION SPECTROSCOPY
Development of ultraviolet absorption photometer for atmospheric ozone measurements and results from mid-latitude investigations p 3468 N93-28949
Femtosecond laser studies of excited state dynamics
[AD-A263708] p 3439 N93-29918
Experimental and theoretical aspects of excited state electron transfer and related phenomena
[AD-A263457] p 3570 N93-30589

ABSTRACTS
NASA SBIR abstracts of 1991 phase 1 projects
[NASA-TM-108240] p 3609 N93-29323
The 2nd International symposium on electrochemical impedance spectroscopy (extended abstracts)
[AD-A262994] p 3312 N93-29462
ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials
[CPIA-PUBL-589] p 3343 N93-30061
Scientific research abstracts in the Republic of China, 1991 (science and technology) p 3670 N93-30911

ABUNDANCE
Multiwavelength studies of classical nova shells
p 3636 N93-30412

ACCELERATION (PHYSICS)
Enhanced reduction of velocity data obtained during CETA flight experiment
[NASA-TM-4460] p 3431 N93-29209
Testing in combined dynamic environments
[DE93-010679] p 3278 N93-29250
Residual acceleration data on IML-1: Development of a data reduction and dissemination plan

GRO: Red-shifted electron-positron annihilation gamma-rays from radiopulsars
[NASA-CR-193243] p 3635 N93-30053

ACCELERATION STRESSES (PHYSIOLOGY)
Acquisition of physiological data during G-induced Loss of Consciousness (G-LOC)
[AD-A264492] p 3496 N93-30400

ACCELERATION TOLERANCE
Issues on human acceleration tolerance after long-duration space flights
[NASA-TM-104753] p 3495 N93-29651

ACCELERATORS
Low-frequency vibration environment for five Shuttle missions
[NASA-TM-106059] p 3285 N93-28554

ACCELEROMETERS
A microseismometer for terrestrial and extraterrestrial applications p 3434 N93-28765

ACCEPTOR MATERIALS
Growth, characterization and device development in monocrystalline diamond films
[AD-A263204] p 3593 N93-28874
Coherent and semi-coherent neutron transfer reactions
[DE93-008336] p 3565 N93-28959
Uniaxially stressed Ge:Ga and Ge:Be
[DE93-010426] p 3594 N93-29150
Defect studies in low-temperature-grown GaAs
[DE93-010405] p 3595 N93-29417
Experimental and theoretical aspects of excited state electron transfer and related phenomena
[AD-A263457] p 3570 N93-30589

ACCESS CONTROL
Minimum security requirements for multi-user operating systems
[PB93-185999] p 3522 N93-30832

ACCIDENT INVESTIGATION
Vehicle dynamic stability and rollover
[PB93-185437] p 3447 N93-30828

ACCIDENT PRONENESS
Accident proneness: A research review
[DOT/FAA/AM-93/9] p 3498 N93-28622

ACCOMMODATION COEFFICIENT
In-situ temperature and concentration measurements of organosilicon decomposition in a chemical vapor deposition reactor
[ONERA-P-1990-3] p 3313 N93-30109

ACCRETION DISKS
IUE observations of cataclysmic variable
[NASA-CR-193188] p 3629 N93-28634
Effects of spiral shocks on disk emission lines
[DE92-641716] p 3637 N93-31004

ACCUMULATIONS
SWAT system performance predictions
[AD-A262857] p 3579 N93-29470

ACCUMULATORS
From orbital debris capture systems through internal combustion engines on Mars p 3232 N93-29745

ACCURACY
The effect of clock, media, and station location errors on Doppler measurement accuracy
p 3246 N93-29588
Issues, concepts, and standard techniques in assessing accuracy of coordinate measuring machines
[PB93-184331] p 3354 N93-29666
Performance analysis of subspace methods
[AD-A263984] p 3530 N93-29865
Determinants of performance rating accuracy: A field study
[AD-A264726] p 3500 N93-30575

ACETALDEHYDE
Distribution of C1-C2 aldehydes in the free troposphere
[JUEL-2650] p 3475 N93-28475

ACETONE
Surface chemistry of hydrogen-passivated porous silicon-oxidation of surface Si-H groups by acetone
[AD-A264655] p 3315 N93-30526

ACETYLENE
Conjugated substituted ionic polyacetylenes
[AD-A264702] p 3337 N93-30497

ACID BASE EQUILIBRIUM
Coordination compounds of aluminum as precursors to aluminum nitride
[AD-A264700] p 3327 N93-30574

ACID RAIN
Emission inventories: A global modeling perspective
[DE93-005817] p 3469 N93-28965

ACIDITY
High octane ethers from synthesis gas-derived alcohols
[DE93-012470] p 3341 N93-28752

ACIDS
Studies in Lewis acid and superacid ionic liquids
[AD-A264683] p 3316 N93-30551

ACOUSTIC ATTENUATION
Sound attenuation characteristics of the standard DH-132A and SPH-4 helmets worn in combination with standard issue earplugs
[AD-A263011] p 3506 N93-29406
Sound wave scattering from a rigid sphere
[AD-A264182] p 3562 N93-30157

ACOUSTIC COUPLING
Theoretical and experimental study of thermoacoustic engines
[AD-A261934] p 3561 N93-28995

ACOUSTIC EXCITATION
Quiet by design: Numerical acousto-elastic analysis of aircraft structures
[ISBN-90-386-0042-9] p 3248 N93-29268

ACOUSTIC FATIGUE
Nonlinear analyses of composite aerospace structures in sonic fatigue
[NASA-CR-193124] p 3451 N93-29154

ACOUSTIC MEASUREMENT
Inservice diagnostic methods for solenoid-operated valves
[DE93-007823] p 3443 N93-28968
Acousto-Ultrasonic analysis of failure in ceramic matrix composite tensile specimens
[NASA-TM-106219] p 3449 N93-29073
Constant frequency pulsed phase-locked loop measuring device
[NASA-CASE-LAR-13823-1] p 3431 N93-29084
External acoustical noise measurements for aviation systems
[AD-A263138] p 3562 N93-29480

ACOUSTIC PROPAGATION
Sonic boom problem for future highspeed aircraft
[ONERA-NT-1990-3] p 3241 N93-30020

ACOUSTIC PROPERTIES
An integrated optimum design approach for high speed prop-rotors including acoustic constraints
[NASA-CR-193222] p 3248 N93-29153
Unsteady vortex loop/dipole theory applied to the work and acoustics of an ideal low speed propeller
[AD-A264057] p 3241 N93-29891

ACOUSTIC SCATTERING
The wave, the cylinder, and the plate
[DE93-009458] p 3450 N93-28596
Sound wave scattering from an elastic spherical shell
[AD-A264039] p 3562 N93-30029
Sound wave scattering from a rigid sphere
[AD-A264182] p 3562 N93-30157
Evaluation of the scattered pressure due to infinite rigid cylinders, infinite elastic cylindrical shells, and rigid spheres in the presence of an ambient noise field
[AD-A264835] p 3563 N93-30899

ACOUSTIC SOUNDING
Remote sensing survey of Mississippi River-Gulf Outlet, Breton Sound disposal area, Plaquemines Parish, Louisiana
[AD-A263097] p 3459 N93-29146

ACOUSTIC VELOCITY
Sound wave scattering from a rigid sphere
[AD-A264182] p 3562 N93-30157

ACOUSTICS
JPRS report: Science and technology. Central Eurasia: Physics and mathematics
[JPRS-UPM-93-002] p 3560 N93-29022
Acoustic charge transport technology investigation for advanced development transponder
p 3386 N93-29602
Unsteady vortex loop/dipole theory applied to the work and acoustics of an ideal low speed propeller

Transforming AdaPT to Ada9x
[NASA-CR-193117] p 3526 N93-29026
Reactive integration for traditional programming languages
[AD-A263986] p 3531 N93-29866
Estimating Ada system size during development
[AD-A263880] p 3532 N93-30022
Using Penelope to assess the correctness of NASA Ada software: A demonstration of formal methods as a counterpart to testing
[NASA-CR-4509] p 3533 N93-30380
Procedures for applying Ada quality prediction models
[AD-A264730] p 3534 N93-30546
An approach to software quality prediction from Ada designs
[AD-A264731] p 3534 N93-30547

ADAPTATION
Adaptive defuzzification for fuzzy systems modeling
p 3512 N93-29532
Beta-adrenergic blockade and lactate metabolism during exercise at high altitude
[AD-A263544] p 3495 N93-29820
Enhanced convergence adaptive detection
[AD-A264100] p 3399 N93-30879

ADAPTIVE CONTROL
The dynamic behavior of constrained adaptive array sensor processors
[AD-A262402] p 3541 N93-28494
Description of the Joint Damping Experiment (JDX)
p 3263 N93-28703
Adaptive structures flight experiments
p 3263 N93-28704
Clustering of tethered satellite system simulation data by an adaptive neuro-fuzzy algorithm
p 3512 N93-29535
Genetic algorithms in adaptive fuzzy control
p 3518 N93-29572
Materials for adaptive structural acoustic control, volume 1
[AD-A264619] p 3562 N93-30121
Division by polynomial matrix and its application to multivariable linear systems p 3357 N93-30233
An information theoretic approach to stochastic adaptive control application to manipulators with active inertia
p 3359 N93-30247
An adaptive controller for a class of MIMO non-minimum phase systems with disturbance rejection design
p 3359 N93-30248
Materials for adaptive structural acoustic control, volume 2
[AD-A264620] p 3563 N93-30385

ADAPTIVE FILTERS
The dynamic behavior of constrained adaptive array sensor processors
[AD-A262402] p 3541 N93-28494
Realization of high speed adaptive FIR digital filters
p 3355 N93-30222
Synchronization of the LAPTV adative filter with input statistics p 3358 N93-30242
Adaptive filtering for clutter suppression in high frequency radar p 3377 N93-30355
Adaptive airborne radar simulation with equalization filter taps
[AD-A264722] p 3393 N93-30514
Enhanced convergence adaptive detection
[AD-A264100] p 3399 N93-30879

ADAPTIVE OPTICS
Characterization of laboratory generated turbulence by optical phase measurements
[AD-A262596] p 3480 N93-28465
SWAT 2 overview
[AD-A262905] p 3578 N93-29139
SWAT laboratory test results
[AD-A262906] p 3578 N93-29140
SWAT system performance predictions
[AD-A262857] p 3579 N93-29470
Sodium guide star adaptive optics system for astronomical imaging in the visible and near-infrared
[DE93-009543] p 3630 N93-29785

ADDITIVES
Process optimization of Hexoloy SX-SiC towards improved mechanical properties
[DE93-007913] p 3320 N93-28564
Ambient-atmosphere compatible superconducting fullerenes
[AD-A262025] p 3595 N93-29397
The 2-6 semiconductor superlattices
[AD-A264343] p 3597 N93-30164
Study on diamond semiconductor
[DE92-531076] p 3413 N93-30622

ADHESION
Evaluation of polyaryl adhesives in elastomer-stainless steel joints
[DE93-009794] p 3329 N93-28551
A study of the chemical mechanism in lubrication
[DE93-012230] p 3330 N93-28650
Effect of metallic-coating properties on the tribology of coated and oil-lubricated ceramics
[DE93-010663] p 3330 N93-28666
The mechanical response of gold substrates modified with self-assembling monolayer films
[AD-A262997] p 3452 N93-29515
Effect of water immersion on fiber/matrix adhesion in thermoplastic composites
[AD-A263646] p 3299 N93-29984
Structure, adhesion, and stability of metal/oxide and oxide/oxide interfaces
[DE93-012930] p 3325 N93-30060
Adhesion of thick film Au to alumina ceramics
[DE93-009802] p 3339 N93-30656
Studies of fiber-matrix adhesion on compression strength p 3304 N93-30846

ADHESION TESTS
Design and evaluation of a uniaxial pull test for lithium hydride/deuteride
[DE93-010760] p 3451 N93-28832

ADHESIVE BONDING
Evaluation of polyaryl adhesives in elastomer-stainless steel joints
[DE93-009794] p 3329 N93-28551
A study of the chemical mechanism in lubrication
[DE93-012230] p 3330 N93-28650
The adhesion of AgI molecules to gaseous metallic silver cluster cations
[AD-A264820] p 3338 N93-30628

ADHESIVES
Evaluation of polyaryl adhesives in elastomer-stainless steel joints
[DE93-009794] p 3329 N93-28551
Preliminary properties of a resin from ethynyl terminated materials p 3303 N93-30842

Performance of thermal adhesives in forced convection p 3293 N93-30974

ADIABATIC CONDITIONS
Dynamics and photoexcitation in MX and MXX' chain solids
[AD-A264823] p 3561 N93-29711

ADIABATIC EQUATIONS
Classification theorem for principal fibre bundles, Berry's phase, and exact cycle evolution
[DE93-011114] p 3556 N93-28601

ADJUSTING
CATS EYES adjustment procedures
[AD-A264069] p 3508 N93-29924

ADRENERGICS
Beta-adrenergic blockade and lactate metabolism during exercise at high altitude
[AD-A263544] p 3495 N93-29820

ADSORBENTS
Fluids in porous media.
[PB93-175198] p 3428 N93-30759

ADSORPTION
Adsorption of sulfate on metal electrodes
[AD-A263192] p 3309 N93-28540
Photodissociation of HBr/LiF(001): A quantum mechanical model
[NASA-CR-193119] p 3603 N93-28933
In situ Fourier transform infrared spectroscopic study of bisulfate and sulfate adsorption on gold, with and without the underpotential deposition of copper
[AD-A263421] p 3323 N93-29259
What is underneath? Moving atoms and molecules to find out
[AD-A263363] p 3567 N93-29332
FI-STM investigation of atomic hydrogen adsorption on the Si(100)2x1 surface
[AD-A262748] p 3567 N93-29403
Adsorption of hydrated halide ions on charged electrodes: Molecular dynamics simulation
[AD-A263137] p 3568 N93-29619
Interfacial viscosity measurements of adsorbed monolayers on metal surfaces
[AD-A263288] p 3324 N93-29803
Kinetics and dynamics of reacting systems
[AD-A264046] p 3313 N93-30030
Surface chemistry of N2H4 on Si(100)-2x1
[AD-A264819] p 3316 N93-30627
Fluids in porous media.
[PB93-175198] p 3428 N93-30759
Change of solar cell element properties influenced by adsorbed atoms
[DE93-606694] p 3466 N93-30777
Complex-compound heat pump: Topical report on phase 1 results
[PB93-185460] p 3466 N93-30814

ADVANCED VERY HIGH RESOLUTION RADIOMETER
Utilization of NOAA/AVHRR data for energy balance of Lake Constance (Switzerland) p 3458 N93-28926
Derivation of conductive heat transfer in mountains from AVHRR data p 3458 N93-28927

ADVECTION
Shear, strain, and thermohaline vertical fine structure in the upper ocean p 3488 N93-30046

AERIAL RECONNAISSANCE
Contributions to the American Meteorological Society's 26th International Conference on Radar Meteorology
[AD-A263385] p 3481 N93-29257

AEROACOUSTICS
Some aspects of the aeroacoustics of high-speed jets
[NASA-CR-191458] p 3418 N93-28975
Contribution to the study of the interaction between acoustic waves and coherent structures induced by a prismatic cylinder in a rectangular cavity
[ONERA-NT-1990-10] p 3314 N93-30203

AEROASSIST
Hypersonic lateral and directional stability characteristics of aeroassist flight experiment configuration in air and CF4
[NASA-TM-4435] p 3239 N93-29166

AERODYNAMIC CHARACTERISTICS
Effect of canard wing positions on aerodynamic characteristics of swept-forward wing
[AD-A262373] p 3238 N93-28493
International aviation (Selected articles)
[AD-A262566] p 3227 N93-28576
Experimental evaluation of a cooled radial-inflow turbine
[NASA-TM-106230] p 3251 N93-28697
An integrated optimum design approach for high speed prop-rotors including acoustic constraints
[NASA-CR-193222] p 3248 N93-29153
High Reynolds number and turbulence effects on aerodynamics and heat transfer in a turbine cascade
[NASA-TM-106187] p 3420 N93-29157
Recent applications of CFD to the aerodynamics of Army projectiles
[AD-A262953] p 3240 N93-29512
The application of concentric vortex simulation to calculating the aerodynamic characteristics of bodies of revolution at high angles of attack
[AD-A263879] p 3241 N93-29919
Heat transfer and aerodynamics of a 3D design nozzle guide vane tested in the Pyestock Isentropic Light Piston Facility p 3252 N93-29928
Experimental study of heat transfer close to a plane wall heated in the presence of multiple injections (subsonic flow) p 3253 N93-29931
The aerodynamic effect of coolant ejection in the leading edge region of a film-cooled turbine blade
p 3258 N93-29958
A computational model that couples aerodynamic and structural dynamic behavior of parachutes during the opening process
[AD-A264115] p 3241 N93-30119

AERODYNAMIC COEFFICIENTS
Hypersonic lateral and directional stability characteristics of aeroassist flight experiment configuration in air and CF4
[NASA-TM-4435] p 3239 N93-29166

AERODYNAMIC CONFIGURATIONS
Recent applications of CFD to the aerodynamics of Army projectiles
[AD-A262953] p 3240 N93-29512

AERODYNAMIC DRAG
Modeling the effects of drop drag and breakup on fuel sprays
[AD-A263650] p 3445 N93-29388
Construction, wind tunnel testing and data analysis for a 1/5 scale ultra-light wing model p 3243 N93-29778
Vortex shedding by blunt/bluff bodies at high Reynolds numbers. Volume 4: Rectangles
[AD-A264154] p 3241 N93-30151

AERODYNAMIC FORCES
Vortex shedding by blunt/bluff bodies at high Reynolds numbers. Volume 4: Rectangles
[AD-A264154] p 3241 N93-30151

AERODYNAMIC HEAT TRANSFER
The effect of orthogonal-mode rotation on forced convection in a circular-sectioned tube fitted with full circumferential transverse ribs p 3254 N93-29937

AERODYNAMIC HEATING
The infrared measurement for the reentry-body-translation
[AD-A263100] p 3278 N93-29134
Ablation problems using a finite control volume technique
[DE93-009861] p 3549 N93-29187

AERODYNAMIC LOADS
Evaluation of four advanced nozzle concepts for short takeoff and landing performance
[NASA-TP-3314] p 3239 N93-29165
Report on the test set-up for the structural testing of the Airmass Sunburst Ultralight Aircraft
p 3249 N93-29775
NASTRAN analysis for the Airmass Sunburst model 'C' Ultralight Aircraft p 3249 N93-29777
Construction, wind tunnel testing and data analysis for a 1/5 scale ultra-light wing model p 3243 N93-29778
Selection and static calibration of the Marsh J1678 pressure gauge p 3249 N93-29779

AERODYNAMIC NOISE
Subjective response to simulated sonic booms with ground reflections
[NASA-TM-107764] p 3561 N93-28692
Computation of far-field helicopter rotor tone noise
[ONERA-P-1990-5] p 3562 N93-30110

AERODYNAMIC STALLING
X-31 demonstration of integrated flight and propulsion control for effective combat at extreme angles of attack
p 3260 N93-28851
Requirements for pilot assistance in a thrust-vectoring combat aircraft p 3504 N93-28870
Simulation, characterization and control of forced unsteady viscous flows using Navier-Stokes equations
[AD-A264333] p 3425 N93-30369

AERODYNAMICS
International aviation (Selected articles)
[AD-A262566] p 3227 N93-28576
Construction, wind tunnel testing and data analysis for a 1/5 scale ultra-light wing model p 3243 N93-29778

AEROELASTICITY
The natural excitation technique (NExT) for modal parameter extraction from operating wind turbines
[DE93-010611] p 3463 N93-28603
Transonic flows on an oscillating airfoil and their effect on the flutter-boundary
[DLR-FB-92-08] p 3238 N93-29006
An integrated optimum design approach for high speed prop-rotors including acoustic constraints
[NASA-CR-193222] p 3248 N93-29153

AEROGELS
Thermal properties of organic and modified inorganic aerogels
[DE93-009230] p 3311 N93-29263

AERONAUTICAL ENGINEERING
JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-92-007] p 3353 N93-28635
JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-92-006] p 3353 N93-28636
JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-92-010] p 3353 N93-28674
JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-92-008] p 3353 N93-28675
JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-93-003] p 3353 N93-28691
Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program
[NASA-CR-192962] p 3227 N93-29712
Project summary p 3227 N93-29714
Preliminary design studies of an advanced general aviation aircraft p 3228 N93-29717

AERONAUTICS
Research and technology objectives and plans: Summary fiscal year 1991
[NASA-TM-103086] p 3660 N93-29452

AEROSOLS
Activities report of the International Meteorological Institute, Stockholm (Sweden)
[ETN-93-93768] p 3480 N93-28519
Aerosol particle analysis by Raman scattering technique
[DE93-005587] p 3309 N93-28880
Development of a 9.3 micrometer CW LIDAR for the study of atmospheric aerosol
[NASA-CR-193227] p 3381 N93-29105
Ocean aerosol measurements and models in the straits of Florida (The KEY-90 experiment)
[AD-A264777] p 3487 N93-29659
Quantifying and minimizing uncertainty of climate forcing by anthropogenic aerosols
[NASA-TM-108259] p 3472 N93-30043
Simulation and calculation of diffusive aerosol deposition
[DE93-007518] p 3474 N93-30506
Marine microbial production of dimethylsulfide from dissolved dimethylsulfoniopropionate
[NASA-CR-193278] p 3492 N93-30665

AEROSPACE ENGINEERING
International aviation (Selected articles)
[AD-A262566] p 3227 N93-28576
JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-92-007] p 3353 N93-28635
JPRS report: Science and technology. Central Eurasia: Engineering and equipment

JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-92-010] p 3353 N93-28674
JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-92-008] p 3353 N93-28675
JPRS report: Science and technology. Central Eurasia: Engineering and equipment
[JPRS-UEQ-93-003] p 3353 N93-28691
Low-cost Active Structural Control space experiment (LASC) p 3263 N93-28700
Godunov-type schemes applied to detonation flows
[NASA-CR-191447] p 3509 N93-28841
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 28: The technical communication practices of Russian and US aerospace engineers and scientists
[NASA-TM-108249] p 3612 N93-28948
Research and technology objectives and plans: Summary fiscal year 1991
[NASA-TM-103086] p 3660 N93-29452
A perspective on acquisition of NASA space systems
[AD-A263246] p 3610 N93-29499
Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program
[NASA-CR-192962] p 3227 N93-29712
Design study to simulate the development of a commercial transportation system p 3228 N93-29718
An overview of DARPA's advanced space technology program p 3269 N93-29908
NASA/DoD Aerospace Knowledge Diffusion Research Project. Paper 30: The electronic transfer of information and aerospace knowledge diffusion
[NASA-TM-109223] p 3616 N93-30036

Technology Transfer and the Civil Space Program. Volume 2: Workshop proceedings [NASA-TM-108250] p 3625 N93-30692
OAST space research and technology applications: Technology transfer successes p 3625 N93-30693
Technology coordination p 3626 N93-30706
NASA space research and technology overview (ITP) p 3628 N93-30722
Space research and technology overview p 3628 N93-30723

AEROSPACE ENVIRONMENTS
Low-frequency vibration environment for five Shuttle missions [NASA-TM-106059] p 3285 N93-28554
The Optical Properties Monitor (OPM): A multipurpose optical laboratory in space p 3266 N93-28729
Low Earth orbital mission aboard the Space Test Experiments Platform (STEP-3) p 3267 N93-28732
High-performance visible/UV CCD focal plane technology for spacebased applications p 3434 N93-28771
Advanced engine study program [NASA-CR-187217] p 3287 N93-28946
Natural environmental service support to NASA vehicle, technology, and sensor development programs [NASA-CR-192554] p 3469 N93-29029
Enhanced reduction of velocity data obtained during CETA flight experiment [NASA-TM-4460] p 3431 N93-29209
LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium [NASA-CP-3194-PT-1] p 3660 N93-29621
LDEF: Dosimetric measurement results (AO 138-7 experiment) p 3573 N93-29635
LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium [NASA-CP-3194-PT-4] p 3665 N93-29682
Degradation of optical components in a space environment p 3582 N93-29692
Effects of long term space environment exposure on optical substrates and coatings (S0050-2) p 3582 N93-29694
LDEF space optics handbook p 3582 N93-29695
Holographic data storage crystals for the LDEF p 3435 N93-29697
Analyses of space environment effects on active fiber optic links orbited aboard the LDEF p 3583 N93-29699
Final results of space exposed experiment developed for students p 3492 N93-29702
Continued results of the seeds in space experiment p 3492 N93-29703
LDEF archival system plan p 3624 N93-29704
Next generation optical instruments and space experiment based on the LDEF thermal control surfaces experiment (S0069) p 3583 N93-29706
Future radiation measurements in low Earth orbit p 3654 N93-29708
Effects of device scaling and geometry on MOS radiation hardness assurance [DE93-009832] p 3413 N93-30516

AEROSPACE INDUSTRY
Technology Transfer and the Civil Space Program. Volume 2: Workshop proceedings [NASA-TM-108250] p 3625 N93-30692
NASP technology transfer p 3627 N93-30713
Technology transfer between the government and the aerospace industry p 3628 N93-30716

AEROSPACE MEDICINE
Acquisition of physiological data during G-induced Loss of Consciousness (G-LOC) [AD-A264492] p 3496 N93-30400

AEROSPACE SAFETY
Risk-based spacecraft fire safety experiments p 3267 N93-28738
SPECS: Orbital debris removal p 3234 N93-29754

AEROSPACE SCIENCES
Research and technology objectives and plans: Summary fiscal year 1991 [NASA-TM-103086] p 3660 N93-29452
The prehistory of ESRO, 1959 - 1960 [ESA-HSR-1] p 3660 N93-29500
Technology coordination p 3626 N93-30706

AEROSPACE SYSTEMS
Lightweight flexible composite tent materials [AD-A263021] p 3295 N93-28660
Low-cost Active Structural Control space experiment (LASC) p 3263 N93-28700
Graphical interface between the CIRSSE testbed and CimStation software with MCS/CTOS [NASA-CR-193276] p 3527 N93-29218
Spacecraft surface charging handbook [AD-A262778] p 3279 N93-29305
A perspective on acquisition of NASA space systems [AD-A263246] p 3610 N93-29499
Tactical satellites p 3284 N93-29893
Spacecraft and launch systems for TACSAT applications p 3284 N93-29904
An overview of DARPA's advanced space technology program p 3269 N93-29908
The planning coordinator: A design architecture for autonomous error recovery and on-line planning of intelligent tasks [NASA-CR-193250] p 3543 N93-30039
Consultative Committee for Space Data Systems recommendation for space data system standards: Telecommand. Part 2.1: Command operation procedures [NASA-TM-108158] p 3393 N93-30371
OAST space research and technology applications: Technology transfer successes p 3625 N93-30693
Technology transfer from the viewpoint of a NASA prime contractor p 3626 N93-30701
A representative survey of US space systems and methods for estimating their costs [AD-A264159] p 3272 N93-30881

AEROSPACE TECHNOLOGY TRANSFER
Technology Transfer and the Civil Space Program. Volume 2: Workshop proceedings [NASA-TM-108250] p 3625 N93-30692
OAST space research and technology applications: Technology transfer successes p 3625 N93-30693
White House/OSTP perspective p 3625 N93-30696
Technology transfer p 3626 N93-30699
Technology transfer to the broader economy p 3628 N93-30719
Strategic directions and mechanisms in technology transfer p 3628 N93-30720
Workshop conclusions: Technology transfer and the civil space program p 3628 N93-30721
Technology transfer in the NASA Ames Advanced Life Support Division p 3628 N93-30724
A research experiment on facilitation and formation of joint research and development programs between government, industry, and universities: Overview, preliminary findings, and observations p 3628 N93-30725

AEROSPACE VEHICLES
Preliminary properties of a resin from ethynyl terminated materials p 3303 N93-30842
Advanced electromagnetic methods for aerospace vehicles [NASA-CR-193468] p 3400 N93-31036

AEROTHERMODYNAMICS
Heat transfer in high turbulence flows: A 2-D planar wall jet p 3254 N93-29935
Aerothermic calculations of flows in interdisc cavities of turbines p 3256 N93-29947
Aero-thermal design of a cooled transonic NGV and comparison with experimental results p 3257 N93-29957

AFTERBODIES
Fabrication of the V-22 composite AFT fuselage using automated fiber placement p 3302 N93-30443

AFTERBURNING
Thrust augmentation system for low-cost-expendable turbojet engine [AD-A263727] p 3259 N93-30877

AGGREGATES
Growth model of Au films on Ru(001) [DE92-642126] p 3602 N93-30998

AGING (MATERIALS)
Molecular dynamics of physical aging processes in polymer glasses [AD-A263737] p 3334 N93-29856

AGING (METALLURGY)
The temperature dependence of the deformation and oxidation behavior of an age-hardenable beta + alpha-two titanium alloy [AD-A262232] p 3320 N93-28491
Molecular dynamics of physical aging processes in polymer glasses [AD-A263737] p 3334 N93-29856

AGRICULTURE
Remote sensing of agricultural vegetation: Status and perspectives p 3458 N93-28922
The MAESTRO-1 campaign: Analyses of polarimetric SAR data of agricultural fields and forests [BCRS-92-06] p 3460 N93-29320

AGROMETEOROLOGY
National remote sensing programme 2 ACMS project. Phase 1: Validation. Part 1: Definition of validation experiment [BCRS-92-10-PHASE-1-PT-1] p 3461 N93-29465

AIR
Methods for preparation of mixtures of gases in air at the parts-per-billion to parts-per-million concentration range for calibration of monitors [DE92-642433] p 3317 N93-30982

AIR BREATHING ENGINES
Conceptual design of a two-stage-to-orbit vehicle p 3228 N93-29716

AIR CARGO
The development of a parachute system for aerial delivery from high speed cargo aircraft [DE93-008339] p 3239 N93-29035

AIR CONDITIONING
Complex-compound heat pump: Topical report on phase 1 results [PB93-185460] p 3466 N93-30814

AIR CONDITIONING EQUIPMENT
Study of parameters affecting the performance of solar desiccant cooling systems [DE93-000088] p 3465 N93-30206

AIR COOLING
Experimental evaluation of a cooled radial-inflow turbine [NASA-TM-106230] p 3251 N93-28697
Transient thermal behaviour of a compressor rotor with axial cooling air flow and co-rotating or contra-rotating shaft p 3255 N93-29946
Impingement/effusion cooling p 3257 N93-29954

AIR DATA SYSTEMS
The Orbiter Experiments (OEX) program p 3266 N93-28731

AIR DEFENSE
Planning for air to air combat p 3501 N93-28852
Computer assisted evaluation for air close combat based on time interval characterization p 3504 N93-28868
Requirements for pilot assistance in a thrust-vectoring combat aircraft p 3504 N93-28870

AIR FILTERS
Evaluation and optimization of a flexible filtration system for respiratory protection system 21 [AD-A262467] p 3493 N93-28758

AIR FLOW
Jet mixer noise suppressor using acoustic feedback [NASA-CASE-LEW-15170-1] p 3561 N93-28953
The 3-D viscous flow CFD analysis of the propeller effect on an advanced ducted propeller subsonic inlet [NASA-TM-106240] p 3252 N93-29162
Aerothermic calculations of flows in interdisc cavities of turbines p 3256 N93-29947
Air oxidation behavior of fuel for the High Temperature Engineering Test Reactor (HTTR) [DE93-753349] p 3576 N93-30006

AIR LAND INTERACTIONS
Modeling land-surface/atmosphere dynamics for CHAMMP [DE93-008520] p 3476 N93-28677

AIR NAVIGATION
Advanced Transport Operating System (ATOPS) Flight Management/Flight Controls (FM/FC) software description [NASA-CR-191457] p 3250 N93-28621
Engineering management consideration for an integrated aeronautical mobile satellite service p 3374 N93-30337
Adapting system engineering principles to the Canadian Airspace System p 3247 N93-30338

AIR PIRACY
Air piracy and terrorism directed against U.S. Air carriers [AD-A264120] p 3244 N93-30194

AIR POLLUTION
Fugitive hydrocarbon emissions from Pacific OCS facilities, volume 1 [PB93-173797] p 3468 N93-28899
Atmospheric and Geophysical Sciences Division: G-Division did you know? [DE93-007412] p 3469 N93-28967
Global warming potential for SF6 [DE93-007394] p 3469 N93-28972
Summer 1990 Atlanta ozone precursor study (January 1993) [PB93-167203] p 3470 N93-29200
Analysis of protocol gases: An on-going quality assurance audit [PB93-168839] p 3311 N93-29204
The ANL electric vehicle battery R/D program for DOE-EHP [DE93-010658] p 3408 N93-29311
Study to determine the nature and extent of ozone and ozone precursor transport in selected areas of California [PB93-184828] p 3470 N93-29669
Potential effects of HFC-152a on global ozone and climate [DE93-008018] p 3471 N93-29792
Fugitive hydrocarbon emissions from Pacific OCS facilities. Volume 2: Executive summary and user's guide [PB93-173805-VOL-2] p 3471 N93-29861
Multi-Attribute Decision Theory methodology for pollution control measure analysis [DE93-005444] p 3472 N93-30008

AIR QUALITY
Analysis of protocol gases: An on-going quality assurance audit [PB93-168839] p 3311 N93-29204

Multi-Attribute Decision Theory methodology for pollution control measure analysis
[DE93-005444] p 3472 N93-30008
Case study of Frontal Boundary Study Mission 03
[DE93-007176] p 3473 N93-30183

AIR TO AIR MISSILES
Pilot decision aiding for weapon delivery: A novel approach to fire control cueing using parallel computing
p 3501 N93-28853

AIR TRAFFIC
Two simulation studies of precision runway monitoring of independent approaches to closely spaced parallel runways
[AD-A263433] p 3261 N93-29815

AIR TRAFFIC CONTROL
Results of DATAS investigation of ATCRBS environment at the Los Angeles International Airport
[DOT/FAA/CT-93/6] p 3245 N93-28625
Data Multiplexing Network (DMN) equipment Operational Test and Evaluation (OT&E) integration test report
[AD-A263172] p 3538 N93-29490
The 1991-1992 aviation system capacity plan
[AD-A263436] p 3261 N93-29788
Two simulation studies of precision runway monitoring of independent approaches to closely spaced parallel runways
[AD-A263433] p 3261 N93-29815
Classification of radar clutter in an air traffic control environment p 3246 N93-30299
Evolution of radar data processing in the French air traffic control system p 3247 N93-30325
Engineering management consideration for an integrated aeronautical mobile satellite service
p 3374 N93-30337
Adapting system engineering principles to the Canadian Airspace System p 3247 N93-30338
Issues of ATC conflict resolution under real-time constraints p 3247 N93-30350
National Airspace System Performance Analysis Capability (NASPAC) simulation model
p 3247 N93-30351
Enhancing availability, performance, and flexibility of air traffic control air-ground services p 3247 N93-30353
Changing role of telecommunications management in air traffic control in the FAA p 3247 N93-30354
Airspace Design Expert System (ADES), a 2D/3D mapping and modelling tool incorporating an expert system for use in instrument approach design
p 3247 N93-30357
An analysis of en route controller-pilot voice communications
[AD-A264784] p 3394 N93-30611

AIR TRAFFIC CONTROLLERS (PERSONNEL)
Two simulation studies of precision runway monitoring of independent approaches to closely spaced parallel runways
[AD-A263433] p 3261 N93-29815
The air traffic controller's mental model and it's implications for equipment design and trainee selection
p 3372 N93-30322
An analysis of en route controller-pilot voice communications
[AD-A264784] p 3394 N93-30611

AIR TRANSPORTATION
Design study to simulate the development of a commercial transportation system p 3228 N93-29718
The 1991-1992 aviation system capacity plan
[AD-A263436] p 3261 N93-29788
Air piracy and terrorism directed against U.S. Air carriers
[AD-A264120] p 3244 N93-30194

AIR WATER INTERACTIONS
Optical measurements of ripples using a scanning laser slope gauge. Part 1: Instrumentation and preliminary results
[AD-A261939] p 3486 N93-28996
Upper ocean model of dissolved atmospheric gases
[DE93-010151] p 3487 N93-29327
Optical slope/height measurements of small scale waves within the SAXON-FPN experiment
[AD-A262572] p 3487 N93-29422
The 17th Annual Climate Diagnostics Workshop
[PB93-183895] p 3483 N93-29664
A preliminary review of global CO2 exchange between ocean and atmosphere
[AD-A264019] p 3472 N93-30015
Marine microbial production of dimethylsulfide from dissolved dimethylsulfoniopropionate
[NASA-CR-193278] p 3492 N93-30665
Hydrographic observations in the western tropical and subtropical north Atlantic Ocean: Atlantic Climate Change Program (ACCP) and Western Tropical Atlantic Experiment (WESTRAX) during 1990
[PB93-184760] p 3489 N93-30827
IOC-UNEP review meeting on oceanographic processes of transport and distribution of pollutants in the sea
[DE93-605070] p 3490 N93-31019

AIRBORNE EQUIPMENT
Research and development of an airborne multispectral scanner to measure fire, terrestrial and atmospheric characteristics (50 channel)
[NASA-CR-193121] p 3456 N93-28620
A concluding study of the altitude determination deficiencies of the Service Aircraft Instrumentation Package (SAIP)
[AD-A263515] p 3250 N93-29971

AIRBORNE LASERS
Every good virtue you ever wanted in a Q-switched solid-state laser and more: Monolithic, diode-pumped, self-Q-switched, highly reproducible, diffraction-limited Nd:YAG laser p 3442 N93-28772

AIRBORNE RADAR
Development of an airborne MMW FM-CW radar for mapping river ice
[AD-A262655] p 3379 N93-28588
Adaptive airborne radar simulation with equalization filter taps
[AD-A264722] p 3393 N93-30514

AIRBORNE SURVEILLANCE RADAR
Radar beam effects for a flight simulator using signal processor based hardware p 3373 N93-30328

AIRBORNE/SPACEBORNE COMPUTERS
Spacecraft computer technology at Southwest Research Institute p 3522 N93-28813
SEU tolerant computer based on the R3000
[DE93-009294] p 3520 N93-29058
A real-time, hardware-in-the-loop simulation of an unmanned aerial research vehicle
[AD-A262477] p 3248 N93-29409
Airborne data acquisition using a front-end processor architecture p 3373 N93-30329
Space Generic Open Avionics Architecture (SGOAA) reference model technical guide
[NASA-CR-188246] p 3285 N93-31032

AIRCRAFT ACCIDENTS
World commercial aircraft accidents
[DE93-010892] p 3243 N93-28571
An evaluation of B-1B pilot performance during simulated instrument approaches with and without status information
[AD-A263874] p 3507 N93-29888

AIRCRAFT ANTENNAS
Models for performance assessment of HF antennas on the CH-135/Twin Huey helicopter
p 3366 N93-30291
Coupling gain computation between antennas on circular cylinders at SHF/EHF frequencies p 3369 N93-30309

AIRCRAFT APPROACH SPACING
Developing automation for terminal air traffic control: Case study of the imaging aid p 3247 N93-30356

AIRCRAFT COMMUNICATION
Tactical satellites for air command and control
p 3284 N93-29898
Design issues and initial performance of an adaptive air/ground/air HF communication system
p 3375 N93-30342
Enhancing availability, performance, and flexibility of air traffic control air-ground services p 3247 N93-30353

AIRCRAFT CONFIGURATIONS
High-altitude reconnaissance aircraft
p 3227 N93-29713

AIRCRAFT CONSTRUCTION MATERIALS
A demonstration of simple airfoils: Structural design and materials choices
[DE93-007882] p 3238 N93-28662
Nonlinear analyses of composite aerospace structures in sonic fatigue
[NASA-CR-193124] p 3451 N93-29154
Advanced technology composite aircraft structures
[NASA-CR-190420] p 3248 N93-29498
Static and dynamic large deflection flexural response of graphite-epoxy beams
[NASA-CR-4118] p 3454 N93-30374
Composites: A viable option p 3300 N93-30429
Advanced composite structural concepts and material technologies for primary aircraft structures
p 3300 N93-30430
Structural evaluation of curved stiffened composite panels fabricated using a THERM-Xsm process
p 3301 N93-30435
Lessons learned for composite structures
p 3302 N93-30444
First NASA Advanced Composites Technology Conference, part 2
[NASA-CP-3104-PT-2] p 3303 N93-30841
Characterization of multiaxial warp knit composites
p 3304 N93-30851
Development of resins for composites by resin transfer molding p 3305 N93-30853
Advanced fiber/matrix material systems
p 3305 N93-30854
Mechanical and analytical screening of braided composites for transport fuselage applications
p 3305 N93-30855
Construction and testing of simple airfoils to demonstrate structural design, materials choice, and composite concepts p 3243 N93-30979

AIRCRAFT CONTROL
Artificial intelligence methodologies in flight related differential game, control and optimization problems
[AD-A262405] p 3541 N93-28498
X-31 demonstration of integrated flight and propulsion control for effective combat at extreme angles of attack
p 3260 N93-28851

AIRCRAFT DESIGN
International aviation (Selected articles)
[AD-A262566] p 3227 N93-28576
Reliability assessment at airline inspection facilities. Volume 2: Protocol for an eddy current inspection reliability experiment
[DOT/FAA/CT-92/12-VOL-2] p 3449 N93-28685
Design considerations for a night, air-to-surface attack capability on a dual role fighter p 3251 N93-28871
An integrated optimum design approach for high speed prop-rotors including acoustic constraints
[NASA-CR-193222] p 3248 N93-29153
Quiet by design: Numerical acousto-elastic analysis of aircraft structures
[ISBN-90-386-0042-9] p 3248 N93-29268
High-altitude reconnaissance aircraft
p 3227 N93-29713
Project summary p 3227 N93-29714
Project ARES 2: High-altitude battery-powered aircraft
p 3227 N93-29715
Preliminary design studies of an advanced general aviation aircraft p 3228 N93-29717
Design study to simulate the development of a commercial transportation system p 3228 N93-29718
Design of a turbofan powered regional transport aircraft p 3228 N93-29721
Solar powered multipurpose remotely powered aircraft
p 3229 N93-29722
Preliminary development of a VTOL unmanned air vehicle for the close-range mission
[AD-A263514] p 3354 N93-29969
Sonic boom problem for future highspeed aircraft
[ONERA-NT-1990-3] p 3241 N93-30020
Cost studies for commercial fuselage crown designs
p 3302 N93-30440
A unified approach for composite cost reporting and prediction in the ACT program p 3302 N93-30441
Lessons learned for composite structures
p 3302 N93-30444
First NASA Advanced Composites Technology Conference, part 2
[NASA-CP-3104-PT-2] p 3303 N93-30841
Multi-parameter optimization tool for low-cost commercial fuselage crown designs
p 3305 N93-30858
Design and analysis of grid stiffened concepts for aircraft composite primary structural applications
p 3306 N93-30861
A comparison of classical mechanics models and finite element simulation of elastically tailored wing boxes
p 3306 N93-30863
Tailored composite wings with elastically produced chordwise camber p 3308 N93-30876

AIRCRAFT ENGINES
An analysis of the correlation between the J52 engine component improvement program and improved maintenance parameters
[AD-A262062] p 3251 N93-28984
The design of two-stage-to-orbit vehicles
p 3228 N93-29719

AIRCRAFT EQUIPMENT
Hybrid oxygen system
[AD-A262417] p 3500 N93-28464
A new class of mission support for combat air-crew
p 3501 N93-28854
The design and development of the new RAF standard HUD format p 3502 N93-28856
Standardization of automatic test equipment in the US Air force
[AD-A262076] p 3250 N93-29004
The NASA SBIR product catalog
[NASA-TM-108242] p 3609 N93-29322
High reliability, maintenance-free INS battery development
[AD-A264521] p 3412 N93-30406

AIRCRAFT FUELS
Advanced thermally-stable, coal-derived, jet fuels program: Experiment system and model development
[AD-A262747] p 3342 N93-29402

AIRCRAFT GUIDANCE
Advanced Transport Operating System (ATOPS) Flight Management/Flight Controls (FM/FC) software description
[NASA-CR-191457] p 3250 N93-28621
Head-steered sensor flight test results and implications p 3502 N93-28859
The quest for an integrated flying helmet
p 3502 N93-28860
Human capabilities and limitations in situation awareness p 3503 N93-28863
Tactical satellites for air command and control
p 3284 N93-29898
Evaluation of category 3 MLS designs
p 3247 N93-30358
Aircraft guidance for wind shear avoidance: Decision-making under uncertainty p 3246 N93-31005
AIRCRAFT ICING
A passive infrared ice detection technique for helicopter applications
[NASA-CR-193187] p 3244 N93-29152
FAA international conference on airplane ground deicing
[AD-A263617] p 3244 N93-29286
AIRCRAFT INSTRUMENTS
The design and development of the new RAF standard HUD format p 3502 N93-28856
Cognitive interface considerations for intelligent cockpits p 3503 N93-28865
A concluding study of the altitude determination deficiencies of the Service Aircraft Instrumentation Package (SAIP)
[AD-A263515] p 3250 N93-29971
AIRCRAFT LANDING
Helicopter approach capability using the differential global positioning system
[NASA-CR-193183] p 3245 N93-28936
Evaluation of four advanced nozzle concepts for short takeoff and landing performance
[NASA-TP-3314] p 3239 N93-29165
AIRCRAFT MAINTENANCE
Reliability assessment at airline inspection facilities. Volume 2: Protocol for an eddy current inspection reliability experiment
[DOT/FAA/CT-92/12-VOL-2] p 3449 N93-28685
Aircraft and refueler bonding and grounding study
[AD-A262027] p 3261 N93-29398
AIRCRAFT MANEUVERS
X-31 demonstration of integrated flight and propulsion control for effective combat at extreme angles of attack
p 3260 N93-28851
Planning for air to air combat p 3501 N93-28852
The design and development of the new RAF standard HUD format p 3502 N93-28856
Computation of a delta-wing roll-and-hold maneuver
[AD-A264704] p 3260 N93-30498
AIRCRAFT MODELS
A demonstration of simple airfoils: Structural design and materials choices
[DE93-007882] p 3238 N93-28662
Modal survey of a full-scale F-18 wind tunnel model
[AD-A262482] p 3240 N93-29410
Solution of Euler equations for forebody-inlet ensemble of aircraft at high angle of attack
[AD-A263905] p 3240 N93-29862
RCS of fundamental scatterers in the HF band by wire-grid modelling p 3371 N93-30320
AIRCRAFT NOISE
External acoustical noise measurements for aviation systems
[AD-A263138] p 3562 N93-29480
AIRCRAFT PERFORMANCE
Evaluation of four advanced nozzle concepts for short takeoff and landing performance
[NASA-TP-3314] p 3239 N93-29165
Flight mechanical model for performance calculations and interactions between flight vehicle and ramjet in regard to the flight orbit
[ESA-TT-1267] p 3248 N93-29464
AIRCRAFT PILOTS
Head-steered sensor flight test results and implications p 3502 N93-28859
The quest for an integrated flying helmet
p 3502 N93-28860
The physiological limitations of man in the high G environment p 3503 N93-28861
Field test of a computer-driven tool to measure psychological characteristics of aircrew
[AD-A264484] p 3499 N93-30425
AIRCRAFT SAFETY
FAA international conference on airplane ground deicing
[AD-A263617] p 3244 N93-29286
Progress through precedent: Going where no helicopter simulator has gone before p 3237 N93-30686
Aircraft guidance for wind shear avoidance: Decision-making under uncertainty p 3246 N93-31005
AIRCRAFT STRUCTURES
Reliability assessment at airline inspection facilities. Volume 2: Protocol for an eddy current inspection reliability experiment
[DOT/FAA/CT-92/12-VOL-2] p 3449 N93-28685
Nonlinear analyses of composite aerospace structures in sonic fatigue
[NASA-CR-193124] p 3451 N93-29154
Advanced technology composite aircraft structures
[NASA-CR-190420] p 3248 N93-29498
The Ultra Light Aircraft Testing
[NASA-CR-193043] p 3249 N93-29774
Report on the test set-up for the structural testing of the Airmass Sunburst Ultralight Aircraft
p 3249 N93-29775
Static and dynamic large deflection flexural response of graphite-epoxy beams
[NASA-CR-4118] p 3454 N93-30374
Composites: A viable option p 3300 N93-30429
Advanced composite structural concepts and material technologies for primary aircraft structures
p 3300 N93-30430
Composites technology for transport primary structure
p 3300 N93-30431
Design, analysis, and fabrication of the technology integration box beam p 3300 N93-30433
Structural evaluation of curved stiffened composite panels fabricated using a THERM-Xsm process
p 3301 N93-30435
Resin transfer molding for advanced composite primary aircraft structures p 3301 N93-30438
Consolidation of graphite thermoplastic textile preforms for primary aircraft structure p 3302 N93-30439
F-15 composite engine access door
p 3302 N93-30442
First NASA Advanced Composites Technology Conference, part 2
[NASA-CP-3104-PT-2] p 3303 N93-30841
Advanced fiber/matrix material systems
p 3305 N93-30854
Multi-parameter optimization tool for low-cost commercial fuselage crown designs
p 3305 N93-30858
Design and analysis of grid stiffened concepts for aircraft composite primary structural applications
p 3306 N93-30861
Optimization of composite sandwich cover panels subjected to compressive loadings p 3306 N93-30862
Advanced fiber placement of composite fuselage structures p 3306 N93-30864
Structural response of bead-stiffened thermoplastic shear webs p 3308 N93-30873
An overview of the crash dynamics failure behavior of metal and composite aircraft structures
p 3308 N93-30875
Construction and testing of simple airfoils to demonstrate structural design, materials choice, and composite concepts p 3243 N93-30979
AIRCRAFT WAKES
Determination of surface heat transfer and film cooling effectiveness in unsteady wake flow conditions
p 3253 N93-29933
Vortex wake characteristics of B757-200 and B767-200 aircraft using the tower fly-by technique
[PB93-180255] p 3242 N93-30387
Vortex wake characteristics of B757-200 and B767-200 aircraft using the tower fly-by technique
[PB93-180263] p 3242 N93-30388
AIRFOILS
Development and testing of the Perseus proof-of-concept aircraft
[DE93-010121] p 3247 N93-28586
A demonstration of simple airfoils: Structural design and materials choices
[DE93-007882] p 3238 N93-28662
Development of an unstructured solution adaptive method for the quasi-three-dimensional Euler and Navier-Stokes equations
[NASA-CR-193241] p 3421 N93-29213
A parallel implicit incompressible flow solver using unstructured meshes
[AD-A263395] p 3424 N93-29851
Keynote address: Unsteady, multimode transition in gas turbine engines p 3252 N93-29927
Determination of surface heat transfer and film cooling effectiveness in unsteady wake flow conditions
p 3253 N93-29933
Prediction of jet impingement cooling scheme characteristics (airfoil leading edge application)
p 3255 N93-29941
Construction and testing of simple airfoils to demonstrate structural design, materials choice, and composite concepts p 3243 N93-30979
AIRFRAMES
Development and testing of the Perseus proof-of-concept aircraft
[DE93-010121] p 3247 N93-28586
A unified approach for composite cost reporting and prediction in the ACT program p 3302 N93-30441
Fabrication of the V-22 composite AFT fuselage using automated fiber placement p 3302 N93-30443
AIRLINE OPERATIONS
The 1991-1992 aviation system capacity plan
[AD-A263436] p 3261 N93-29788
AIRPORT SECURITY
Future directions in aviation security
p 3244 N93-30274
AIRPORTS
The 1991-1992 aviation system capacity plan
[AD-A263436] p 3261 N93-29788
AIRSHIPS
Tethered aerostat VLF/LF transmitter system design considerations p 3399 N93-30753
AIRSPACE
The 1991-1992 aviation system capacity plan
[AD-A263436] p 3261 N93-29788
Airspace Design Expert System (ADES), a 2D/3D mapping and modelling tool incorporating an expert system for use in instrument approach design
p 3247 N93-30357
ALBEDO
Atmospheric correction of LANDSAT-TM-data for forest inventory p 3459 N93-28929
Modeling the bidirectional reflectance and spectra
[AD-A263570] p 3462 N93-29830
ALBUMINS
Amino acid sequences for the binding regions in serum albumin proteins
[NASA-CASE-MFS-28402-1] p 3491 N93-28952
ALCOHOLS
Design of a high activity and selectivity alcohol catalyst
[DE93-012277] p 3309 N93-28750
Mass spectrometric investigation of 2-methoxyethanol and 2-ethoxyethanol clusters: Magic numbers and structural implications
[AD-A262822] p 3312 N93-29429
ALDEHYDES
Distribution of C1-C2 aldehydes in the free troposphere
[JUEL-2650] p 3475 N93-28475
ALGAE
Process for selectively recovering algae and protozoa
[NASA-CASE-MFS-26124-1-NPO] p 3491 N93-29174
Marine microbial production of dimethylsulfide from dissolved dimethylsulfoniopropionate
[NASA-CR-193278] p 3492 N93-30665
ALGEBRA
Antirational transductions and their language families
[ETN-93-93794] p 3611 N93-28525
Research in mathematics and computer science, March 1, 1991 - September 30, 1992
[DE93-011492] p 3509 N93-28573
How to write fast and clear parallel programs using algebra
[DE93-000797] p 3524 N93-28640
Deformations of the Lie algebras L1(H(2)) and L1(W(2))
[MEMO-1056] p 3547 N93-28667
An algebraic approach to the quantization of constrained systems: Finite dimensional examples
p 3548 N93-28671
The generic arithmetic of SISYPHE
[INRIA-RT-0136] p 3524 N93-28755
Dynamic factorization in large-scale optimization
[AD-A263993] p 3528 N93-29345
The general theory of convolutional codes
p 3385 N93-29595
Turning SOS rules into equations
[CWI-CS-R9218] p 3532 N93-30017
Positive energy representations of the conformal quantum algebra
[DE93-606064] p 3551 N93-30809
Connections between quantized affine algebras and superalgebras
[DE93-606065] p 3551 N93-30810
Abelian gauge theories on homogeneous spaces
[DE92-644730] p 3607 N93-30921
Beltrami parametrization and gauging of Virasoro and w-infinity algebras
[DE92-644844] p 3557 N93-30928
On one-dimensional topological and conformal field theories
[DE92-644726] p 3558 N93-30986
ALGORITHMS
Resource limited reasoning: A study of literature in the context of model-based diagnosis
[MEMO-INF-92-38] p 3540 N93-28480

Coarse image motion for saccade control
[OUEL-1916/92] p 3523 N93-28485
Research in mathematics and computer science, March 1, 1991 - September 30, 1992
[DE93-011492] p 3509 N93-28573
Filtering interpolators for image comparison algorithms
p 3463 N93-28797
Planning for air to air combat p 3501 N93-28852
A summary of block schemes for reducing a general matrix to Hessenberg form
[DE93-010621] p 3525 N93-28877
A simple parallel prefix algorithm for compact finite-difference schemes
[NASA-CR-191448] p 3525 N93-28976
Research in efficient scientific computation
[AD-A262084] p 3525 N93-28986
Implementation of a multidomain Navier-Stokes code on the Intel iPSC2 hypercube
[FFA-TN-1992-37] p 3418 N93-28994
An autonomous vision-based mobile robot
p 3443 N93-29082
Resource utilization model for the algorithm to architecture mapping model
[NASA-CR-193122] p 3527 N93-29171
Speech recognition by recursive stochastic modelling
[ISBN-90-9005038-8] p 3382 N93-29266
Iterative encoding methods for computer generated holograms
[AD-A263705] p 3431 N93-29297
Fast multipole method in simulations of aqueous systems
[AD-A263422] p 3567 N93-29336
Collection-oriented match: Scaling up the data in production systems
[AD-A262755] p 3615 N93-29459
Implementation of parallel algorithms
[AD-A263126] p 3529 N93-29496
A fuzzy clustering algorithm to detect planar and quadric shapes p 3511 N93-29524
A fuzzy measure approach to motion frame analysis for scene detection p 3511 N93-29525
Adaptive defuzzification for fuzzy systems modeling
p 3512 N93-29532
A model for amalgamation in group decision making
p 3513 N93-29540
A conjugate gradients/trust regions algorithms for training multilayer perceptrons for nonlinear mapping
p 3519 N93-29581
Inference in fuzzy rule bases with conflicting evidence
p 3519 N93-29583
Reference equations of motion for automatic rendezvous and capture
[NASA-CR-185676] p 3269 N93-29652
Communications neural net processors
[AD-A263330] p 3542 N93-29763
A functional implementation of the Jacobi eigen-solver
[DE93-007349] p 3549 N93-29769
Polynomial space polynomial delay algorithms for listing families of graphs
[DE93-010677] p 3530 N93-29808
NESL: A nested data-parallel language (Version 2.6)
[AD-A263548] p 3530 N93-29822
Class notes: Programming parallel algorithms CS 15-840B (Fall 1992)
[AD-A263549] p 3530 N93-29823
Performance analysis of subspace methods
[AD-A263984] p 3530 N93-29865
Efficient algorithms for the evaluation of planar network reliability
[AD-A263602] p 3531 N93-29916
Turning SOS rules into equations
[CWI-CS-R9218] p 3532 N93-30017
Simplified Linear Equation Solvers: User's manual
[DE93-011975] p 3550 N93-30140
QR decomposition based least squares lattice algorithm p 3358 N93-30239
Feature segmentation using a multiple-stack based chain coding algorithm p 3359 N93-30243
Computation of a delta-wing roll-and-hold maneuver
[AD-A264704] p 3260 N93-30498
Efficient algorithms and data structures in geometric design
[AD-A264678] p 3534 N93-30544
Nonsmooth optimization algorithms, system theory, and software tools
[AD-A264679] p 3534 N93-30549
The 1991 neural information processing systems: Natural and synthetic
[AD-A264754] p 3623 N93-30559
Adaptive networks for sequential decision problems
[AD-A264756] p 3534 N93-30561
A method for intersection line calculation between parametric surfaces
[ETN-93-94178] p 3551 N93-30572
An algorithm for simple and complex feature detection: From retina to primary visual cortex
[AD-A264306] p 3497 N93-30897
Algorithm for the solution of the Faddeev equation for a system of three identical spinless particles
[DE92-644678] p 3535 N93-30914
Algorithm of numerical calculations of differential Yakubovsky equations for the (1 + 3) scattering problem
[DE92-644679] p 3535 N93-30915
Bayesian linear analysis with application to removal of atmospheric influences on optical remote sensing images
[BCRS-92-19] p 3463 N93-31011

ALKALI HALIDES
Adsorption of hydrated halide ions on charged electrodes: Molecular dynamics simulation
[AD-A263137] p 3568 N93-29619

ALKALI METALS
Neutron scattering studies of the structures and lattice dynamics of the alkali metals
[DE93-008272] p 3593 N93-28956
A simple model for ion solvation with non additive cores
[AD-A263075] p 3566 N93-29143
Elastic and reactive collisions of atoms and molecules with neutral alkali clusters
[DE93-009313] p 3566 N93-29206
Change of solar cell element properties influenced by adsorbed atoms
[DE93-606694] p 3466 N93-30777

ALKALINE EARTH METALS
Change of solar cell element properties influenced by adsorbed atoms
[DE93-606694] p 3466 N93-30777

ALKANES
Selective nitrations. Volume 2: The laser-induced nitration of three cycloalkanes
[AD-A263250] p 3438 N93-29800
NMR studies of molecules in liquid crystals and graphite
[DE93-010423] p 3569 N93-29805
Observation of phase-separated nanometer scale molecular domains in mixed self-assembled monolayers
[AD-A263470] p 3569 N93-29839

ALKYL COMPOUNDS
Catalytic synthesis of silicon carbide preceramic polymers: Polycarbosilanes
[DE93-008634] p 3329 N93-28541
Observation of phase-separated nanometer scale molecular domains in mixed self-assembled monolayers
[AD-A263470] p 3569 N93-29839

ALLOYING
Fundamental aspects in the design of passive alloys
[DE93-009028] p 3320 N93-28545
High temperature creep and oxidation resistant chromium silicide matrix alloy containing molybdenum
[NASA-CASE-LEW-15697-1] p 3323 N93-29172
Aluminium-high strength material by mechanical alloying and reaction milling: Basics of processing and characterisation of material
[ESA-TT-1249] p 3324 N93-29272
Eutectic solidification of Al-U at slowly cooling rates (10 C per second)
[DE92-640082] p 3328 N93-30941
Powder metallurgy: Solid and liquid phase sintering of copper p 3294 N93-30976

ALLOYS
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-008] p 3322 N93-29012
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-007] p 3322 N93-29013
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-009] p 3322 N93-29015
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-012] p 3296 N93-29016
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-013] p 3296 N93-29017
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-016] p 3296 N93-29018
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-014] p 3322 N93-29019
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-015] p 3322 N93-29020
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-93-001] p 3296 N93-29021
DOE fundamentals handbook: Material science
[DE93-012224] p 3314 N93-30199
Tool grinding and spark testing p 3291 N93-30954

ALOHA SYSTEM
A slotted Aloha satellite channel simulator
p 3360 N93-30250
Comparison of two random access techniques for the North American MSAT system p 3370 N93-30315

ALPHA PARTICLES
Collective transport of alpha particles due to Alfven wave instability
[DE93-009578] p 3587 N93-29148

ALPINE METEOROLOGY
Fog studies in the Alpine region with digital NOAA/AVHRR data p 3458 N93-28925

ALPS MOUNTAINS (EUROPE)
SAR shape-from-shading for a populated alpine area
p 3458 N93-28923

ALTERNATIVES
An experimental methodology for a fuzzy set preference model p 3514 N93-29547

ALTIMETRY
Multibeam laser altimeter for planetary topographic mapping p 3442 N93-28780
Charting the remote southern oceans with geosat altimetry
[AD-A263452] p 3461 N93-29817

ALTITUDE
The cone structure and focusing of the electric field of VLF and LF waves at high altitudes of the ionosphere
p 3395 N93-30731

ALTITUDE ACCLIMATIZATION
Beta-adrenergic blockade and lactate metabolism during exercise at high altitude
[AD-A263544] p 3495 N93-29820
Field trial of caffeine on physical performance at altitude: An attempt to overcome the challenge
[AD-A264260] p 3497 N93-30894

ALTITUDE SICKNESS
The Environmental Symptoms Questionnaire (ESQ): Development and application
[AD-A264127] p 3495 N93-30196

ALUMINATES
Studies in Lewis acid and superacid ionic liquids
[AD-A264683] p 3316 N93-30551

ALUMINIDES
Microstructural effects on the deformation and fracture of the alloy Ti-25Al-10Nb-3B-1Mo
[AD-A263095] p 3323 N93-29144
Low temperature environmental embrittlement in ordered intermetallics
[DE93-009711] p 3324 N93-29786
Platinum-modified diffusion aluminide coatings on nickel-base superalloys
[AD-A263597] p 3325 N93-29981
Improvement in ductility of the intermetallic compound Ti3Al
[ESA-TT-1276] p 3325 N93-30105
Order-disorder transformations in Ni-Al alloys
[DE93-009293] p 3326 N93-30389

ALUMINUM
Microtextured metals for stray-light suppression in the Clementine startracker p 3286 N93-28785
Transient response of embedded thermocouples
[DE93-009889] p 3431 N93-29325
Processing and property evaluation of silver or aluminum matrix YBa2Cu3O(6+x) superconducting materials
[AD-A263382] p 3595 N93-29333
Damage areas on selected LDEF aluminum surfaces
p 3283 N93-29374
Boron carbide aluminum cermets for external pressure housing applications
[AD-A262749] p 3333 N93-29404
An experimental/analytical evaluation of biaxial sheet failure
[DE93-010620] p 3453 N93-29843

ALUMINUM ALLOYS
Electrochemical behavior and surface chemistry of aluminum alloys: Solute-rich interphase model
[AD-A262061] p 3322 N93-29002
The growth of small corrosion fatigue cracks in alloy 2024
[NASA-TM-107755] p 3451 N93-29069
An experimental investigation of radioactivity induced by ions associated with the operation of pulsed-power accelerators
[DE93-011478] p 3575 N93-29151
Oxidation behavior in reaction-bonded aluminum-silicon alloy/alumina powder compacts
[DE93-010407] p 3298 N93-29191
Aluminium-high strength material by mechanical alloying and reaction milling: Basics of processing and characterisation of material
[ESA-TT-1249] p 3324 N93-29272
Mechanisms of fracture and creep of structural alloys
[AD-A263108] p 3324 N93-29799

Mechanical properties of several magnesium and aluminum composites
[AD-A262481] p 3299 N93-30137
Two-parameter crack tip field associated with stable crack growth in a thin plate: A hybrid analysis
[AD-A264221] p 3453 N93-30147
Order-disorder transformations in Ni-Al alloys
[DE93-009293] p 3326 N93-30389
Constitutive laws for deformation and dynamic recrystallization in cubic metals
[DE93-010740] p 3326 N93-30486
Reactive sintering of Ni3Al intermetallic alloys under compressive stress
[DE93-009729] p 3327 N93-30652
Eutectic solidification of Al-U at slowly cooling rates (10 C per second)
[DE92-640082] p 3328 N93-30941

ALUMINUM ARSENIDES
Low-cost, high-efficiency solar cells utilizing GaAs-on-Si technology
[DE93-000096] p 3464 N93-29965

ALUMINUM CHLORIDES
Studies in Lewis acid and superacid ionic liquids
[AD-A264683] p 3316 N93-30551

ALUMINUM COMPOUNDS
Process optimization of Hexoloy SX-SiC towards improved mechanical properties
[DE93-007913] p 3320 N93-28564

ALUMINUM GALLIUM ARSENIDES
Luminescence study of ion-implanted and MBE-grown Er-doped GaAs and Al(x)Ga(1-x)As
[AD-A262602] p 3591 N93-28471
Infrared rugates by molecular beam epitaxy
p 3582 N93-28808
Optoelectronic technology consortium
[AD-A263580] p 3580 N93-29973
Growth and development of GaInAsP for use in high-efficiency solar cells
[DE93-000098] p 3465 N93-30208
Development of ultra-low noise, high sensitivity planar metal grating coupled 3-5 multiquantum well infrared detectors for focal plane array staring IR sensor systems
[AD-A264465] p 3599 N93-30536

ALUMINUM NITRIDES
Coordination compounds of aluminum as precursors to aluminum nitride
[AD-A264700] p 3327 N93-30574

ALUMINUM OXIDES
Oxidation behavior in reaction-bonded aluminum-silicon alloy/alumina powder compacts
[DE93-010407] p 3298 N93-29191
A transient FGM interlayer based approach to joining ceramics
[DE93-010415] p 3331 N93-29248
Investigation of ion beam mixing of iron marker layers in aluminum oxide by RBS
[DE93-010727] p 3594 N93-29314
Adhesion of thick film Au to alumina ceramics
[DE93-009802] p 3339 N93-30656
Tensile creep behavior of polycrystalline alumina fibers
[NASA-TM-106269] p 3340 N93-30938

ALUMINUM SILICATES
The effect of oxidation embrittlement on the impact behavior of nicalon reinforced CAS 2 ceramic matrix composites
[AD-A263567] p 3334 N93-29829

ALVEOLI
The chronic effects of jP-8 jet fuel exposure on the lungs
[AD-A264162] p 3495 N93-30153

AMBIENT TEMPERATURE
Ambient-atmosphere compatible superconducting fullerenes
[AD-A262025] p 3595 N93-29397

AMINES
Synthesis of cubane based energetic molecules
[AD-A263271] p 3564 N93-28562
Acid gas treating by aqueous alkanolamines
[PB93-176188] p 3471 N93-29676
Diffusion coefficients and heats of mixing in aqueous alkanolamines
[PB93-176212] p 3316 N93-30661

AMINO ACIDS
Amino acid sequences for the binding regions in serum albumin proteins
[NASA-CASE-MFS-28402-1] p 3491 N93-28952

AMINO RADICAL
NOx chemistry in natural gas flames
[PB93-175263] p 3317 N93-30760

AMMETERS
Investigation of methods for the measurement of small electron bundle currents
[DIGEL-1992-4] p 3413 N93-30763
A 250 mA toroid monitor for the measurement of the bundle current in the stretcher mode of AmPS
[DIGEL-1992-1] p 3413 N93-30835

AMMONIA
Complex-compound heat pump: Topical report on phase 1 results
[PB93-185460] p 3466 N93-30814

AMMONIUM COMPOUNDS
Synthesis of cubane based energetic molecules
[AD-A263271] p 3564 N93-28562
Ion emission during high-energy sputtering of ammonium dinitramide and ammonium nitrate crystals and the determination of ion decomposition pathways using tandem mass spectrometry p 3318 N93-30066

AMMONIUM NITRATES
Ion emission during high-energy sputtering of ammonium dinitramide and ammonium nitrate crystals and the determination of ion decomposition pathways using tandem mass spectrometry p 3318 N93-30066
Detonation shock dynamics of composite energetic materials p 3350 N93-30096
Isothermal and shock compression of high density ammonium nitrate and ammonium perchlorate
[DE93-000682] p 3315 N93-30209

AMMONIUM PERCHLORATES
Atomic force microscopy of ammmonium perchlorate
p 3349 N93-30091
Microstructural basis for enhanced shock-induced chemistry in single crystals of ammonium perchlorate
p 3319 N93-30092
Defect density measurements in a shocked single crystal of ammonium perchlorate p 3319 N93-30093
Comparison of deformation and shock reactivity for single crystals of RDX and ammonium perchlorate
p 3350 N93-30094
Isothermal and shock compression of high density ammonium nitrate and ammonium perchlorate
[DE93-000682] p 3315 N93-30209

AMORPHOUS MATERIALS
Polar order and relaxation of second order nonlinear optical susceptibility in an electric field polarized amorphous polymer
[AD-A262189] p 3329 N93-28489
High pressure studies of hydrated nafion membranes: Dielectric relaxation and deuteron NMR
[AD-A263511] p 3332 N93-29342
Dipolar orientational relaxation in guest/host amorphous polymer probed by second harmonic generation
[AD-A262006] p 3333 N93-29441
Complex dielectric function of amorphous diamond films deposited by pulsed excimer (ArF) laser ablation of graphite
[AD-A264527] p 3598 N93-30408
Role of oxygen vacancies in anodic TiO2 thin films
[DE92-642137] p 3602 N93-31027

AMPLIFIER DESIGN
Upgrading the LAMPF 201 MHz RF generators
[DE93-010715] p 3406 N93-28830

AMPLITUDE MODULATION
Results of the joint HIPAS/NUWC campaigns to investigate ELF generated by auroral electrojet modulation p 3398 N93-30746

ANALOG CIRCUITS
Analog CMOS circuits for neural networks
p 3355 N93-30223
An architecture for an analog VLSI neural network for early computer vision processing p 3359 N93-30244
Electronics mixed-mode simulation
[AD-A264734] p 3534 N93-30577

ANALOG COMPUTERS
Stochastic architecture for Hopfield neural nets
p 3519 N93-29579

ANALOG DATA
An architecture for an analog VLSI neural network for early computer vision processing p 3359 N93-30244

ANALOG TO DIGITAL CONVERTERS
A compact imaging detector of polarization and spectral content p 3582 N93-28810
Optical antenna beam steering using digital phase shifter control
[AD-D015688] p 3383 N93-29455
A high resolution 14-bit ADC for Gammasphere Project
[DE93-010446] p 3598 N93-30393
Low cost instrumentation: Parallel port analog to digital converter
[AD-A263468] p 3433 N93-30584
The use of DFT windows in signal-to-noise ratio and harmonic distortion computations
[DE93-009800] p 3433 N93-30655
An automated data collection system for a Charpy impact tester p 3293 N93-30972

ANALOGS
Visualizing weld metal solidification using organic analogs p 3293 N93-30973

ANALYSIS (MATHEMATICS)
Environmental studies: Mathematical, computational and statistical analyses
[AD-A264223] p 3473 N93-30360

ANALYTIC FUNCTIONS
Comparison of analytical transport and stochastic solutions for neutron slowing down in an infinite medium
[DE93-010799] p 3565 N93-28833

ANALYTICAL CHEMISTRY
Kinetic studies on gas-phase reaction mechanisms important to the combustion of energetic materials: The CO/N2O reaction p 3347 N93-30084

ANELASTICITY
Anelastic relaxations associated with local disordering in grain boundaries
[AD-A263101] p 3596 N93-29796

ANGLE OF ATTACK
X-31 demonstration of integrated flight and propulsion control for effective combat at extreme angles of attack
p 3260 N93-28851
An experimental study of flow over a 6 to 1 prolate spheroid at incidence p 3239 N93-29124
NASTRAN analysis for the Airmass Sunburst model 'C' Ultralight Aircraft p 3249 N93-29777
Solution of Euler equations for forebody-inlet ensemble of aircraft at high angle of attack
[AD-A263905] p 3240 N93-29862
The application of concentric vortex simulation to calculating the aerodynamic characteristics of bodies of revolution at high angles of attack
[AD-A263879] p 3241 N93-29919
Flight control system design factors for applying automated testing techniques
[NASA-TM-4242] p 3260 N93-30764

ANGULAR DISTRIBUTION
Measurements of light scattering by small particles at an angle of zero degrees
[AD-A263856] p 3580 N93-29887
Analysis of possibilities for using laser scattering for MeV electron beam diagnostics
[DE93-606223] p 3441 N93-30767

ANGULAR MOMENTUM
Investigation of Mars rotational dynamics using Earth-based radio tracking of Mars landers
p 3642 N93-28777
Nonlinear attitude control of planar structures in space using only internal controls p 3280 N93-29991
Planar reorientation of a free-free beam in space using embedded electromechanical actuators
p 3280 N93-29993
Space station attitude disturbance arising from internal motions p 3280 N93-29995
Theoretical studies in nuclear structure
[DE93-012290] p 3570 N93-30505
Integrals of motion on the group of invariance of an interval in three-dimensional spaces
[DE93-606090] p 3606 N93-30797

ANGULAR RESOLUTION
Smart skin structures for identifying and locating laser irradiation
[DE93-005464] p 3436 N93-28887
Measurements of light scattering by small particles at an angle of zero degrees
[AD-A263856] p 3580 N93-29887

ANGULAR VELOCITY
Symbology for head up and head down applications for highly agile fighter aircraft: To improve spatial awareness, trajectory control, and unusual attitude recovery, part 1
p 3502 N93-28857

ANHYDRIDES
Diphenylmethane-containing dianhydride and polyimides prepared therefrom
[NASA-CASE-LAR-14487-1] p 3331 N93-29085
Process to prepare 1,3-diamino-5-pentafluorosulfanylbenzene
[NASA-CASE-LAR-14773-2-CU] p 3312 N93-29506

ANIK SATELLITES
Security of the remote control link of Anik E satellites
p 3365 N93-30282

ANIMALS
Neural mechanisms of attention
[AD-A264345] p 3544 N93-30165
Multiple neuron recording in the hippocampus of freely moving animals
[AD-A264807] p 3492 N93-30594

ANIONS
Synthesis of oligoimides and oligoimide anion radicals
[AD-A263129] p 3290 N93-29474
High-current negative-ion beam transport
[DE93-010732] p 3575 N93-29809

ANISOTROPIC SHELLS
Application of integral and differential equation methods for various EM interaction problems
[AD-A264821] p 3394 N93-30597

ANISOTROPY
Benchmark eigenvalue spectrum calculations with anisotropic effects
[DE93-006387] p 3548 N93-28891
On the meaning of delta T/T
[DE93-008482] p 3653 N93-28962
Hydrodynamic interactions among fibers in high efficiency filters
[DE93-007117] p 3424 N93-30035
Application of integral and differential equation methods for various EM interaction problems
[AD-A264821] p 3394 N93-30597

ANNEALING
Neutron scattering studies of the structures and lattice dynamics of the alkali metals
[DE93-008272] p 3593 N93-28956
Bainitic stabilization of austenite in low alloy steels
[DE93-008275] p 3321 N93-28957
Effects of internal helium on mechanical properties of Nitronic (tm) 40 stainless steel
[DE93-009902] p 3324 N93-29265
Defect studies in low-temperature-grown GaAs
[DE93-010405] p 3595 N93-29417
Isothermal annealing and relaxation of the second harmonic generation signal from a nonlinear optical polymer
[AD-A262007] p 3333 N93-29442
Surface chemistry of N2H4 on Si(100)-2x1
[AD-A264819] p 3316 N93-30627
Superconducting films of YBaCuO
[DE93-606831] p 3600 N93-30772
Processing of novel nanoparticle dispersion strengthened ceramics for improved mechanical performance
[AD-A264191] p 3339 N93-30883

ANNIHILATION REACTIONS
Coupled-channel analysis of low energy nucleon-antinucleon interactions
[DE93-606115] p 3571 N93-30791

ANNOTATIONS
An annotated bibliography on integration in software engineering environments
[AD-A264798] p 3535 N93-30602

ANNUAL VARIATIONS
Investigation of Mars rotational dynamics using Earth-based radio tracking of Mars landers
p 3642 N93-28777
Convective and stratiform rain: Multichannel microwave sensing over oceans
[NASA-TM-104586] p 3482 N93-29448
The distribution of the annual and semiannual cycles in the tropics
[DE92-642213] p 3485 N93-31006

ANNULAR DUCTS
Fluid flow and heat transfer in the entrance region of an annulus between independently rotating tubes with a turbulent axial flow p 3256 N93-29952

ANODES
Alkali metal carbon dioxide electrochemical system for energy storage and/or conversion of carbon dioxide to oxygen
[NASA-CASE-LEW-14973-1] p 3464 N93-28974
Operational results of pilot cell test with cermet inert anodes
[DE93-009338] p 3322 N93-29061

ANOMALIES
A water mass analysis of the 1991-1992 El Nino signal in the Farallon Islands region
[AD-A263490] p 3488 N93-29819
On the photonic chiral anomaly in an external gravitational field
[DE93-606082] p 3479 N93-30785
Compensating fields and anomalies in supergravity
[DE92-644724] p 3637 N93-30919

ANTARCTIC REGIONS
The German satellite ground station in Antarctica: Realization and first results p 3458 N93-28924
A field investigation of water and salt movement in permafrost and the active layer
[AD-A263706] p 3487 N93-29298
Transient (approximately equals 10 s) VLF amplitude and phase perturbations due to lightning-induced electron precipitation into the ionosphere (the Trimpi effect)
p 3396 N93-30736

ANTENNA ARRAYS
Optical antenna beam steering using digital phase shifter control
[AD-D015688] p 3383 N93-29455
Planar microstrip YAGI antenna array
[NASA-CASE-NPO-17873-2-CU] p 3384 N93-29507
Tolerance theory of phased array antennas: A statistical approach p 3369 N93-30307
Results of the joint HIPAS/NUWC campaigns to investigate ELF generated by auroral electrojet modulation p 3398 N93-30746
Study of a VLF distributed antenna array
p 3398 N93-30749

ANTENNA COMPONENTS
DSS-14 subreflector actuator dynamics during the Landers earthquake p 3386 N93-29600
Durability of Quick Reaction Satellite Antenna (QRSA) trunnion castings
[AD-A264095] p 3281 N93-30813

ANTENNA DESIGN
A satellite-tracking millimeter-wave reflector antenna system for mobile satellite-tracking
[NASA-CASE-NPO-18772-1-CU] p 3381 N93-28955
System overview on electromagnetic compensation for reflector antenna surface distortion
[NASA-TM-106217] p 3273 N93-29195
Planar microstrip YAGI antenna array
[NASA-CASE-NPO-17873-2-CU] p 3384 N93-29507
Gravity referenced elevation encoder development
p 3385 N93-29592
DSS-14 subreflector actuator dynamics during the Landers earthquake p 3386 N93-29600
An analysis of the 70-meter antenna hydrostatic bearing by means of computer simulation p 3386 N93-29601
Widebanding techniques for VHF antennas 2
[AD-A263998] p 3387 N93-29882
Fundamental studies of fusion plasmas
[DE93-013144] p 3589 N93-30189
Status of the Canadian military Multibeam Antenna (MBA) development for EHF SATCOM
p 3374 N93-30334
Comparison and design of multiple beam antenna feed networks p 3374 N93-30335
Recent advances in bootlace lens design
p 3374 N93-30336
VLF/LF transmitting antennas p 3398 N93-30747
Application of the Fourier transform to short antennas
p 3398 N93-30750
Antenna modeling and analysis for ELF/VLF/LF applications p 3398 N93-30751

ANTENNA FEEDS
A dual polarized broadband multifrequency Earth station feed p 3371 N93-30319
Comparison and design of multiple beam antenna feed networks p 3374 N93-30335
Recent advances in bootlace lens design
p 3374 N93-30336

ANTENNA RADIATION PATTERNS
Predicting radiation characteristics from antenna physical dimensions
[AD-A262462] p 3379 N93-28654
System overview on electromagnetic compensation for reflector antenna surface distortion
[NASA-TM-106217] p 3273 N93-29195
Optical antenna beam steering using digital phase shifter control
[AD-D015688] p 3383 N93-29455
Propagation channel modeling for angle-diversity combining simulation p 3360 N93-30252
Models for performance assessment of HF antennas on the CH-135/Twin Huey helicopter
p 3366 N93-30291
Computer-aided modeling for analysis of arbitrary scatterers and feeds p 3367 N93-30293
Development of an antenna measurement facility operating in the 2 GHz - 100 GHz frequency range
p 3369 N93-30308
Application of the Fourier transform to short antennas
p 3398 N93-30750
Antenna modeling and analysis for ELF/VLF/LF applications p 3398 N93-30751
Pattern measurements of US Navy ELF antennas
p 3399 N93-30752
Advanced electromagnetic methods for aerospace vehicles
[NASA-CR-193468] p 3400 N93-31036

ANTHROPOMETRY
Neural network technologies
[AD-A262576] p 3541 N93-28987
Anthropometric data from launch and entry suited test subjects for the design of a recumbent seating system
[NASA-TM-104769] p 3505 N93-29044
Anthropometric survey of the astronaut applicants and astronauts from 1985 to 1991
[NASA-RP-1304] p 3506 N93-29324
Methods for characterizing the human head for the design of helmets
[AD-A263875] p 3507 N93-29889

ANTIADRENERGICS
Beta-adrenergic blockade and lactate metabolism during exercise at high altitude
[AD-A263544] p 3495 N93-29820

ANTIBODIES
Evaluation of dried storage of platelets for transfusion: Physiologic integrity and hemostatic functionality
[AD-A263240] p 3494 N93-29620

ANTIFERROMAGNETISM
Numerical simulation of quantum many-body systems
[DE93-008300] p 3603 N93-28958
Phase separation, antiferromagnetism, and superconductivity in superconducting-superoxygenated La(2-x)Sr(x)CuO(4+(delta))
[DE93-009852] p 3598 N93-30517

ANTIMISSILE DEFENSE
Magnetic field measurements of the CEBAF (NIST) wiggler using the pulsed wire method
[AD-A263997] p 3439 N93-29867

ANTINUCLEONS
Towards the results of global analysis of data on nucleon electromagnetic structure
[DE93-606125] p 3571 N93-30792

ANTIREFLECTION COATINGS
High-performance visible/UV CCD focal plane technology for spacebased applications
p 3434 N93-28771
Effects of long term space environment exposure on optical substrates and coatings (S0050-2)
p 3582 N93-29694

ANTISUBMARINE WARFARE
Feature based neural network acoustic transient signal classification
[AD-A263437] p 3562 N93-29816

APERTURES
Electro-optic characterisation of extremely wide bandwidth electrical signals
[AD-A264202] p 3392 N93-30145
Application of the Fourier transform to short antennas
p 3398 N93-30750

APPLICATIONS OF MATHEMATICS
Godunov-type schemes applied to detonation flows
[NASA-CR-191447] p 3509 N93-28841
SIAM Conference on Applications of Dynamical Systems
[DE93-007969] p 3548 N93-29057

APPLICATIONS PROGRAMS (COMPUTERS)
Parallel computation and the basis system
[DE93-008755] p 3537 N93-28544
Minimum Hamiltonian ascent trajectory evaluation (MASTRE) program (update to automatic flight trajectory design, performance prediction, and vehicle sizing for support of shuttle and shuttle derived vehicles) users manual
[NASA-CR-192556] p 3269 N93-28558
Basic OSF/Motif programming and applications
[DE93-010800] p 3524 N93-28834
A distributed object-oriented database application design
[AD-A262591] p 3612 N93-28846
A proposed approach for developing next-generation computational electromagnetics software
[DE93-007326] p 3380 N93-28900
Index mappings for interactive editing of symbolic matrices
[DE93-009316] p 3549 N93-29060
Summer research program (1992). High School Apprenticeship Program (HSAP) reports. Volume 16: Arnold Engineering Development Center Civil Engineering Laboratory
[AD-A262024] p 3608 N93-29396
RTE: A UNIX library with on-line documentation and sample programs for microwave radiative transfer calculations
[PB93-180248] p 3386 N93-29680
TRAB: A transient analysis program for BWR. Part 2: User's manual
[VTT-TIED-1232-PT-2] p 3575 N93-29996
The wake software suite: User's guide
[AD-A264181] p 3425 N93-30156
The First NASA Advanced Composites Technology Conference, part 1
[NASA-CP-3104-PT-1] p 3300 N93-30428
Development of a CFD code for casting simulation
[NASA-CR-192577] p 3427 N93-30492
Computer algebra tools for higher symmetry analysis of nonlinear evolution equations
[DE93-606089] p 3535 N93-30787
Algorithm for the solution of the Faddeev equation for a system of three identical spinless particles
[DE92-644678] p 3535 N93-30914
Algorithm of numerical calculations of differential Yakubovsky equations for the (1 + 3) scattering problem
[DE92-644679] p 3535 N93-30915

APPROACH CONTROL
Developing automation for terminal air traffic control: Case study of the imaging aid p 3247 N93-30356

APPROACH INDICATORS
Developing automation for terminal air traffic control: Case study of the imaging aid p 3247 N93-30356

APPROXIMATION
Polygonal approximation overviews and perspectives
[INRIA-RR-1621] p 3547 N93-28513

A diffusion approximation for a network of reservoirs with power law release rule
[AD-A263753] p 3550 N93-29872

Effect of design selection on response surface performance
[NASA-CR-4520] p 3249 N93-29885

Approximation formulae for functional integrals in P(phi)2-quantum field theory
[DE93-606067] p 3605 N93-30781

Algorithm for the solution of the Faddeev equation for a system of three identical spinless particles
[DE92-644678] p 3535 N93-30914

Fixed point iterations for quasi-contractive maps in uniformly smooth Banach spaces
[DE92-641348] p 3552 N93-30942

AQUEOUS SOLUTIONS

Acid solution absorption of extruded polyethylene foam
[DE93-011701] p 3330 N93-28839

The growth of small corrosion fatigue cracks in alloy 2024
[NASA-TM-107755] p 3451 N93-29069

A field investigation of water and salt movement in permafrost and the active layer
[AD-A263706] p 3487 N93-29298

Fast multipole method in simulations of aqueous systems
[AD-A263422] p 3567 N93-29336

Acid gas treating by aqueous alkanolamines
[PB93-176188] p 3471 N93-29676

Diffusion coefficients and heats of mixing in aqueous alkanolamines
[PB93-176212] p 3316 N93-30661

AQUIFERS

Performance and cost evaluation of bioremediation techniques for fuel spills
[PB93-175545] p 3474 N93-30762

ARC JET ENGINES

Measurements of magnetic fields produced by a 30 kWe class Arcjet Power Conditioning Unit
[AD-A262786] p 3287 N93-28658

ARC WELDING

Welding wire pressure sensor assembly
[NASA-CASE-MFS-26216-1] p 3442 N93-28951

ARCHAEOLOGY

Remote sensing survey of Mississippi River-Gulf Outlet, Breton Sound disposal area, Plaquemines Parish, Louisiana
[AD-A263097] p 3459 N93-29146

ARCHITECTURE

Mars habitat p 3233 N93-29747

Selenia: A habitability study for the development of a third generation lunar base p 3233 N93-29748

ARCHITECTURE (COMPUTERS)

Design of a hardware discrete event simulation coprocessor
[AD-A262614] p 3537 N93-28478

A model for processing the SGML document in version oriented hypertext systems
[ETN-93-93797] p 3611 N93-28528

A multiarchitecture parallel-processing development environment
[NASA-TM-106180] p 3538 N93-28628

Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies
[AGARD-CP-520] p 3501 N93-28850

Efficient wiring of reconfigurable parallel processors
[DE93-009847] p 3538 N93-29186

Using today's technology to improve mobile C4I for the operational commander
[AD-A263613] p 3245 N93-29285

Multisensor image analysis system
[AD-A263679] p 3528 N93-29294

An architecture for robotic system integration
[DE93-010829] p 3444 N93-29316

The parallel implementation of a backpropagation neural network and its applicability to SPECT image reconstruction
[DE93-010304] p 3567 N93-29416

Development of a visual system interface to support a domain-oriented application composition system
[AD-A262489] p 3528 N93-29418

Associative memories for supercomputers
[AD-A263142] p 3520 N93-29482

Digital hardware architecture implementation
[AD-A263219] p 3521 N93-29492

Stochastic architecture for Hopfield neural nets
p 3519 N93-29579

Special purpose parallel computer architecture for real-time control and simulation in robotic applications
[NASA-CASE-NPO-17629-1-CU] p 3521 N93-29608

Synthesis techniques and analysis tools for on-chip fault-tolerance
[AD-A263167] p 3409 N93-29654

Communications neural net processors
[AD-A263330] p 3542 N93-29763

Development of neural network architectures for self-organizing pattern recognition and robotics
[AD-A264831] p 3543 N93-29791

Accelerating the transfer of technology for implementing domain specific software architectures
[AD-A264017] p 3532 N93-30014

The planning coordinator: A design architecture for autonomous error recovery and on-line planning of intelligent tasks
[NASA-CR-193250] p 3543 N93-30039

Canadian Conference on Electrical and Computer Engineering, volumes 1 and 2
[ISBN-0-9694170-1-2] p 3354 N93-30215

A parallel processing system for intensive I/O
p 3362 N93-30262

A transputer based parallel processing architecture for robotics applications p 3362 N93-30263

Technology for national asset storage systems
p 3617 N93-30452

Evolving neural network architecture
[AD-A264802] p 3544 N93-30592

Nonlinear explicit transient finite element analysis on the Intel Delta
[DE93-009561] p 3535 N93-30647

Space Generic Open Avionics Architecture (SGOAA) reference model technical guide
[NASA-CR-188246] p 3285 N93-31032

ARCTIC REGIONS

A field investigation of water and salt movement in permafrost and the active layer
[AD-A263706] p 3487 N93-29298

Design issues and initial performance of an adaptive air/ground/air HF communication system
p 3375 N93-30342

VLF propagation measurements in the Canadian Arctic p 3396 N93-30733

AREA NAVIGATION

Design and implementation of a Global Positioning System (GPS) supported area navigation system with electronic aircraft
[ILR-MITT-275(1992)] p 3246 N93-30671

ARGON

Upper ocean model of dissolved atmospheric gases
[DE93-010151] p 3487 N93-29327

ARID LANDS

A field investigation of water and salt movement in permafrost and the active layer
[AD-A263706] p 3487 N93-29298

Environmental Monitoring and Assessment Program. EMAP: Arid Colorado plateau pilot study
[PB93-181618] p 3474 N93-30823

ARITHMETIC

The generic arithmetic of SISYPHE
[INRIA-RT-0136] p 3524 N93-28755

ARMATURES

Two-dimensional model for current and heat transport in solid-armature railguns
[AD-A262014] p 3271 N93-29394

ARMED FORCES (UNITED STATES)

Summer Faculty Research Program (SFRP), volume 1
[AD-A261988] p 3608 N93-29440

Air Force CALS business practices
[AD-A264789] p 3610 N93-30177

Interagency Advancéd Power Group (IAPG) Meeting Compendium
[DE93-006189] p 3670 N93-30212

ARMOR

The effect of material strength on segment penetration behavior
[AD-A263262] p 3453 N93-29801

ARRAYS

The dynamic behavior of constrained adaptive array sensor processors
[AD-A262402] p 3541 N93-28494

Proposal for a numerical array library
[DE93-010678] p 3623 N93-30482

ARRHYTHMIA

Carbon monoxide exposure of subjects with documented cardiac arrhythmias
[PB93-179943] p 3497 N93-30890

ARSENATES

Two new titanium pyroarsenates: Alpha-TiAs2O7 and Beta-TiAs2O7
[AD-A264632] p 3599 N93-30518

ARSENIC COMPOUNDS

Be3(AsO4)2 2H2O: A new berylloarsenate phase containing bridged tetrahedral 3-rings
[AD-A262518] p 3592 N93-28584

ARTIFICIAL INTELLIGENCE

Artificial intelligence methodologies in flight related differential game, control and optimization problems
[AD-A262405] p 3541 N93-28498

Natural language generation
[AD-A262578] p 3524 N93-28579

Operator and automation capability analysis: Picking the right team p 3503 N93-28864

Cognitive interface considerations for intelligent cockpits p 3503 N93-28865

Uncertainty reasoning in expert systems
[NASA-CR-193120] p 3548 N93-28973

Modelling temporal abductive explanation
[AD-A263096] p 3526 N93-29145

MoCog1: A computer simulation of recognition-primed human decision making
[NASA-TM-103868] p 3542 N93-29386

Information technology: A force for organizational change
[AD-A261986] p 3615 N93-29439

Intelligent virtual reality in the setting of fuzzy sets
p 3513 N93-29544

Automated modeling of physical systems
[NASA-CR-193256] p 3531 N93-29873

Center for the Study of Intelligent Control Systems (Fellowships)
[AD-A263604] p 3543 N93-29917

The planning coordinator: A design architecture for autonomous error recovery and on-line planning of intelligent tasks
[NASA-CR-193250] p 3543 N93-30039

Evolution of a high-performance storage system based on magnetic tape instrumentation recorders
p 3435 N93-30470

Independent research and independent exploratory development programs
[AD-A264735] p 3544 N93-30556

Optimal trajectories for aircraft terrain following and terrain avoidance: A literature review update
[AD-A264075] p 3260 N93-30604

Intelligent real-time problem solving
[AD-A264830] p 3535 N93-30614

ARTIFICIAL SATELLITES

Automating the satellite range scheduling process
[AD-A262601] p 3270 N93-28468

STRV1-b flight experiment p 3265 N93-28723

NEP space test program objective
p 3265 N93-28724

Electric propulsion for lightsats: A review of applications and advantages p 3290 N93-29907

Satellite calibration requirements
[AD-A264279] p 3281 N93-30817

ASCENT TRAJECTORIES

Minimum Hamiltonian ascent trajectory evaluation (MASTRE) program (update to automatic flight trajectory design, performance prediction, and vehicle sizing for support of shuttle and shuttle derived vehicles) users manual
[NASA-CR-192556] p 3269 N93-28558

ASPECT RATIO

Bootstrap current profiles and scaling in large aspect ratio tokamaks
[DE93-753158] p 3589 N93-30003

ASSAYING

Analysis of protocol gases: An on-going quality assurance audit
[PB93-168839] p 3311 N93-29204

Thermal cycler temperature variation and its effect on the polymerase chain reaction
[AD-A264660] p 3337 N93-30541

ASSEMBLING

Spline screw autochanger
[NASA-CASE-GSC-13435-1] p 3445 N93-29505

ASSEMBLY

Spline screw autochanger
[NASA-CASE-GSC-13435-1] p 3445 N93-29505

ASSESSMENTS

Life insurance risk assessment using a fuzzy logic expert system p 3520 N93-29585

ASSOCIATIVE PROCESSING (COMPUTERS)

An adaptive algorithm for linear associative memory problem p 3360 N93-30255

ASTEROID MISSIONS

Clementine 2: A double asteroid flyby and impactor mission p 3268 N93-28770

ASTEROIDS

Proceedings of the Near-Earth-Object Interception Workshop
[NASA-TM-108236] p 3556 N93-28572

Clementine 2: A double asteroid flyby and impactor mission p 3268 N93-28770

A remote laser-mass spectrometer for determination of elemental composition p 3434 N93-28775

Multibeam laser altimeter for planetary topographic mapping p 3442 N93-28780

Systematic processing of Clementine data for scientific analyses p 3624 N93-28803

Space optical and low-frequency radio searches for Earth-crossing asteroids and comets
[DE93-008716] p 3634 N93-29246

Asteroidal versus cometary meteoroid impacts on the Long Duration Exposure Facility (LDEF)
p 3638 N93-29371

Galileo post-Gaspra cruise and Earth-2 encounter
p 3385 N93-29597
ASTRODYNAMICS
Colorado Center for Astrodynamics Research (CCAR)
p 3614 N93-29233
ASTROMETRY
Precision optical interferometry in space
[NASA-CR-193264] p 3630 N93-29163
ASTRONAUTS
Anthropometric survey of the astronaut applicants and astronauts from 1985 to 1991
[NASA-RP-1304] p 3506 N93-29324
ASTRONOMICAL CATALOGS
Far infrared supplement. Third edition: Catalog of infrared observations (lambda greater than or equal to 4.6 micrometers)
[NASA-RP-1295] p 3629 N93-29156
Bonner Durchmusterung (Southern Durchmusterung)
[NASA-RP-1298-VOL-3] p 3630 N93-29811
The faintest stars p 3630 N93-30493
ASTRONOMICAL MODELS
Dark matter: Theoretical perspectives
[DE93-008484] p 3633 N93-28676
Tests of the particle physics-physical cosmology interface
[DE93-008483] p 3634 N93-28963
Fourth-rank gravity and cosmology
[DE92-644722] p 3637 N93-30918
ASTRONOMICAL PHOTOMETRY
Spectroscopic and photometric studies of main sequence M stars and a search for late-type dwarfs in the solar vicinity p 3629 N93-28608
Detection of other planetary systems using photometry p 3632 N93-28791
XRONOS: A timing analysis software package. User's guide, version 3.00
[NASA-TM-109222] p 3532 N93-30023
ASTRONOMICAL SPECTROSCOPY
Spectroscopic and photometric studies of main sequence M stars and a search for late-type dwarfs in the solar vicinity p 3629 N93-28608
ASTRONOMY
Digital image compression using artificial neural networks p 3624 N93-28811
Activities report of the Astronomical Society
[MITT-75] p 3629 N93-29008
Far infrared supplement. Third edition: Catalog of infrared observations (lambda greater than or equal to 4.6 micrometers)
[NASA-RP-1295] p 3629 N93-29156
NSSDC data listing
[NASA-TM-108264] p 3612 N93-29167
ASTROPHYSICS
Near-infrared spectroscopy as an astrophysical tool
p 3632 N93-28607
On the meaning of delta T/T
[DE93-008482] p 3653 N93-28962
Activities report of the Astronomical Society
[MITT-75] p 3629 N93-29008
National collaboratories: Applying information technology for scientific research
[LC-93-83795] p 3612 N93-29129
NSSDC data listing
[NASA-TM-108264] p 3612 N93-29167
ASYMPTOTIC METHODS
Algorithm of numerical calculations of differential Yakubovsky equations for the (1 + 3) scattering problem
[DE92-644679] p 3535 N93-30915
ASYMPTOTIC PROPERTIES
Asymptotic properties of constrained Markov decision processes
[INRIA-RR-1598] p 3553 N93-28508
ASYMPTOTIC SERIES
Errors when shock waves interact due to numerical shock width
[DE93-010699] p 3426 N93-30484
ATLANTIC OCEAN
Steady-state and transient modeling of tracer and nutrient distributions in the global ocean
[DE93-011043] p 3486 N93-28670
Convective and stratiform rain: Multichannel microwave sensing over oceans
[NASA-TM-104586] p 3482 N93-29448
Hydrographic observations in the western tropical and subtropical north Atlantic Ocean: Atlantic Climate Change Program (ACCP) and Western Tropical Atlantic Experiment (WESTRAX) during 1990
[PB93-184760] p 3489 N93-30827
ATMOSPHERIC ATTENUATION
Tunable CW diode-pumped Tm,Ho:YLiF4 laser operating at or near room temperature
[NASA-CASE-NPO-18611-1-CU] p 3440 N93-30415
ATMOSPHERIC BOUNDARY LAYER
Wind loads on canopy roofs
[RR-CE132] p 3451 N93-29106
Surface shear stress estimates from geostrophic winds for use in sensible and latent heat flux formulations
p 3483 N93-30044
ATMOSPHERIC CHEMISTRY
Distribution of C1-C2 aldehydes in the free troposphere
[JUEL-2650] p 3475 N93-28475
Proceedings of the Second Atmospheric Radiation Measurement (ARM) Science Team Meeting
[DE93-005886] p 3476 N93-28889
Emission inventories: A global modeling perspective
[DE93-005817] p 3469 N93-28965
Atmospheric and Geophysical Sciences Division: G-Division did you know?
[DE93-007412] p 3469 N93-28967
Atmospheric and Geophysical Sciences Program report, 1990-1991
[DE93-007390] p 3470 N93-29055
Chemistry of the atmosphere: Its impact on global change. CHEMRAWN 7: Perspectives and recommendations
[PB93-180644] p 3488 N93-29670
Overview of the DOE Atmospheric Chemistry Program's Ozone Project
[DE93-007416] p 3471 N93-29770
Potential effects of HFC-152a on global ozone and climate
[DE93-008018] p 3471 N93-29792
Acoustic-gravity waves from low-altitude localized disturbances
[AD-A264804] p 3479 N93-30593
ATMOSPHERIC CIRCULATION
High performance dispersion model PHYSIC
[DE93-753303] p 3467 N93-28536
The Mechanisms of Solar Variability (MSV) program
[AD-A262525] p 3652 N93-28585
Modeling land-surface/atmosphere dynamics for CHAMMP
[DE93-008520] p 3476 N93-28677
The sensitivity of ageostrophic circulations to model resolution: A case study using NGM forecasts of ERICA IOP-4
[AD-A262011] p 3482 N93-29393
Evaluation of atmospheric wind field and dispersion models for fog-oil smoke dispersion in complex terrain: Field measurement and model evaluation program for assessment of the environmental effects of military smokes
[AD-A262051] p 3482 N93-29399
SWAT system performance predictions
[AD-A262857] p 3579 N93-29470
Wind measurement accuracy of a loran radiosonde
[AD-A263572] p 3483 N93-29832
USU center of excellence in theory and analysis of the geo-plasma environment
[AD-A264750] p 3590 N93-30585
Case study of the operational usefulness of the sharp workstation in forecasting a mesocyclone-induced cold sector tornado event in California
[PB93-178697] p 3485 N93-30889
ATMOSPHERIC COMPOSITION
Predicting the response of a temperate forest ecosystem to atmospheric CO2 increase
[DE93-010081] p 3467 N93-28543
Steady-state and transient modeling of tracer and nutrient distributions in the global ocean
[DE93-011043] p 3486 N93-28670
Mass spectrometric measurement of Martian krypton and xenon isotopic abundance p 3646 N93-28798
Development of ultraviolet absorption photometer for atmospheric ozone measurements and results from mid-latitude investigations p 3468 N93-28949
Emission inventories: A global modeling perspective
[DE93-005817] p 3469 N93-28965
Global warming potential for SF6
[DE93-007394] p 3469 N93-28972
Analysis of protocol gases: An on-going quality assurance audit
[PB93-168839] p 3311 N93-29204
Study to determine the nature and extent of ozone and ozone precursor transport in selected areas of California
[PB93-184828] p 3470 N93-29669
Potential effects of HFC-152a on global ozone and climate
[DE93-008018] p 3471 N93-29792
A preliminary review of global CO2 exchange between ocean and atmosphere
[AD-A264019] p 3472 N93-30015
Case study of Frontal Boundary Study Mission 03
[DE93-007176] p 3473 N93-30183
ATMOSPHERIC CORRECTION
Atmospheric correction of LANDSAT-TM-data for forest inventory p 3459 N93-28929
Bayesian linear analysis with application to removal of atmospheric influences on optical remote sensing images
[BCRS-92-19] p 3463 N93-31011
ATMOSPHERIC EFFECTS
Characterization of laboratory generated turbulence by optical phase measurements
[AD-A262596] p 3480 N93-28465
Results from the US/Russian Meteor-3/Total Ozone Mapping Spectrometer
[NASA-TM-104576] p 3467 N93-28682
Cloud Impacts on DOD Operations and Systems Conference (CIDOS-91)
[AD-A264463] p 3484 N93-30535
ATMOSPHERIC ENTRY
The infrared measurement for the reentry-body-translation
[AD-A263100] p 3278 N93-29134
ATMOSPHERIC GENERAL CIRCULATION MODELS
Modeling land-surface/atmosphere dynamics for CHAMMP
[DE93-008520] p 3476 N93-28677
Proceedings of the Second Atmospheric Radiation Measurement (ARM) Science Team Meeting
[DE93-005886] p 3476 N93-28889
Prognostic cloud water in the Los Alamos general circulation model
[DE93-007381] p 3482 N93-29347
Spectral energetics of the lower thermosphere
p 3477 N93-29467
ATMOSPHERIC HEATING
A correlated k-distribution model of the atmospheric heating rates for overlapping spectra of CO2 and H2O
[DE93-007391] p 3474 N93-30504
ATMOSPHERIC IONIZATION
Discharge of electrically charged clouds
[AD-A263212] p 3480 N93-28518
A computer simulation of the production of an artificially ionized layer using the Arecibo facility
[DE93-010817] p 3478 N93-30487
ATMOSPHERIC MODELS
High performance dispersion model PHYSIC
[DE93-753303] p 3467 N93-28536
Direct volume visualization of three-dimensional vector fields
[DE93-009233] p 3524 N93-28550
Steady-state and transient modeling of tracer and nutrient distributions in the global ocean
[DE93-011043] p 3486 N93-28670
Spherically symmetric model atmospheres for late-type giant stars
[ISBN-0-315-72632-6] p 3633 N93-28673
Emission inventories: A global modeling perspective
[DE93-005817] p 3469 N93-28965
Global warming potential for SF6
[DE93-007394] p 3469 N93-28972
The meteorological database
[DE93-007289] p 3481 N93-29054
Atmospheric and Geophysical Sciences Program report, 1990-1991
[DE93-007390] p 3470 N93-29055
National Center for Supercomputer Applications
p 3614 N93-29232
Exploitation of parallelism in climate models
[DE93-011259] p 3470 N93-29318
Upper ocean model of dissolved atmospheric gases
[DE93-010151] p 3487 N93-29327
The sensitivity of ageostrophic circulations to model resolution: A case study using NGM forecasts of ERICA IOP-4
[AD-A262011] p 3482 N93-29393
Evaluation of atmospheric wind field and dispersion models for fog-oil smoke dispersion in complex terrain: Field measurement and model evaluation program for assessment of the environmental effects of military smokes
[AD-A262051] p 3482 N93-29399
Ocean aerosol measurements and models in the straits of Florida (The KEY-90 experiment)
[AD-A264777] p 3487 N93-29659
The basics of weather models
[AD-A263386] p 3483 N93-29850
Quantifying and minimizing uncertainty of climate forcing by anthropogenic aerosols
[NASA-TM-108259] p 3472 N93-30043
Numerical modeling and parameterization of gravity wave processes and effects in the atmosphere
[AD-A264331] p 3478 N93-30367
A correlated k-distribution model of the atmospheric heating rates for overlapping spectra of CO2 and H2O
[DE93-007391] p 3474 N93-30504
Graphical comparison of U.S. standard atmospheres and military standard climatic extremes
[AD-A264639] p 3484 N93-30521

USU center of excellence in theory and analysis of the geo-plasma environment
[AD-A264750] p 3590 N93-30585
ATMOSPHERIC PHYSICS
JPRS report: Science and technology. Central Eurasia: Earth science
[JPRS-UES-93-003] p 3456 N93-29089
National collaboratories: Applying information technology for scientific research
[LC-93-83795] p 3612 N93-29129
NSSDC data listing
[NASA-TM-108264] p 3612 N93-29167
Analysis of mass transport and potential vorticity budget in a simulated tropopause folding
[PB93-156792] p 3476 N93-29197
Syllabus physical meteorology, part 1
[KNMI-TR-140-PT-1] p 3484 N93-30114
ATMOSPHERIC PRESSURE
Discharge of electrically charged clouds
[AD-A263212] p 3480 N93-28518
Surface shear stress estimates from geostrophic winds for use in sensible and latent heat flux formulations
p 3483 N93-30044
NOx chemistry in natural gas flames
[PB93-175263] p 3317 N93-30760
ATMOSPHERIC RADIATION
Proceedings of the Second Atmospheric Radiation Measurement (ARM) Science Team Meeting
[DE93-005886] p 3476 N93-28889
Clouds and radiation: A primier
[AD-A263136] p 3482 N93-29479
The possible direct use of satellite radiance measurements by the Atmospheric Radiation Measurement Program
[DE93-009819] p 3462 N93-30049
ATMOSPHERIC REFRACTION
Propagation channel modeling for angle-diversity combining simulation p 3360 N93-30252
ATMOSPHERIC SOUNDING
Case study of the operational usefulness of the sharp workstation in forecasting a mesocyclone-induced cold sector tornado event in California
[PB93-178697] p 3485 N93-30889
ATMOSPHERIC STRATIFICATION
Laboratory studies of gravity wave/mean flow interactions
[AD-A264226] p 3478 N93-30174
ATMOSPHERIC TURBULENCE
Characterization of laboratory generated turbulence by optical phase measurements
[AD-A262596] p 3480 N93-28465
SWAT system performance predictions
[AD-A262857] p 3579 N93-29470
Atmospheric transverse coherence length measurement system for laser communications
[AD-A263563] p 3439 N93-29827
ATOM CONCENTRATION
Planetary and satellite x ray spectroscopy: A new window on solid-body composition by remote sensing
p 3641 N93-28773
ATOMIC BEAMS
Surface modification of tribological components in transportation
[DE93-008647] p 3442 N93-28903
ATOMIC COLLISIONS
Elastic and reactive collisions of atoms and molecules with neutral alkali clusters
[DE93-009313] p 3566 N93-29206
ATOMIC EXCITATIONS
Excited states in electronic structure calculations
[DE93-007704] p 3592 N93-28642
Inner-shell photo-ionized x ray laser schemes
[DE93-009285] p 3438 N93-29309
ATOMIC INTERACTIONS
The APX spectrometer for Martian missions
p 3434 N93-28776
Radiation effects in FCC metals and intermetallic compounds: A molecular dynamics computer simulation study
[DE93-009546] p 3600 N93-30668
ATOMIC PHYSICS
Start broadened profiles with self-consistent radiation transfer and atomic kinetics in plasmas produced by high intensity lasers
[DE93-008706] p 3586 N93-29093
The 26th International Quantum Chemistry Symposium on Atomic, Molecular, and Condensed Matter Theory and Computational Methods
[AD-A264206] p 3315 N93-30534
Physics laboratory technical activities, 1992
[PB93-178648] p 3561 N93-30888
ATOMIC STRUCTURE
Powder x ray diffraction patterns of energetic materials for use as reference standards
[DE93-009903] p 3592 N93-28568
Theory of normal and superconducting properties of fullerene-based solids
[DE93-007722] p 3592 N93-28582
Excited states in electronic structure calculations
[DE93-007704] p 3592 N93-28642
Spectroscopic probes of vibrationally excited molecules at chemically significant energies
[DE93-012328] p 3564 N93-28652
Planetary and satellite x ray spectroscopy: A new window on solid-body composition by remote sensing
p 3641 N93-28773
Structure, adhesion, and stability of metal/oxide and oxide/oxide interfaces
[DE93-012930] p 3325 N93-30060
Center for surface radiation damage studies
[AD-A264330] p 3570 N93-30366
Atomic layer epitaxy of semiconductor heterostructures
[AD-A264755] p 3599 N93-30560
A tight binding model for the electronic structure of FCC and SC C60
[DE93-606214] p 3601 N93-30794
Role of oxygen vacancies in anodic TiO2 thin films
[DE92-642137] p 3602 N93-31027
ATOMIZING
Estimation of droplet collision frequency in a spray
[DE93-007991] p 3416 N93-28566
Aluminium-high strength material by mechanical alloying and reaction milling: Basics of processing and characterisation of material
[ESA-TT-1249] p 3324 N93-29272
Pulse mitigation and heat transfer enhancement techniques. Volume 2: Effect of surface wettability and roughness in evaporative spray cooling
[AD-A264174] p 3425 N93-30155
ATOMS
Atomic layer epitaxy of semiconductor heterostructures
[AD-A264755] p 3599 N93-30560
ATTENUATORS
Formulation of Ames 24E2 IR-black coating
[NASA-TM-102864] p 3629 N93-29453
ATTITUDE (INCLINATION)
Symbology for head up and head down applications for highly agile fighter aircraft: To improve spatial awareness, trajectory control, and unusual attitude recovery, part 1
p 3502 N93-28857
Long Duration Exposure Facility (LDEF) attitude measurements of the Interplanetary Dust Experiment
p 3638 N93-29377
Utility of a ghost horizon and climb/dive ladder line tapering on a head-up display
[AD-A264401] p 3508 N93-30167
Attitude determination using GPS: Development of an all solid-state guidance, navigation, and control sensor for air and space vehicles based on the global positioning system p 3246 N93-30605
ATTITUDE CONTROL
Reference equations of motion for automatic rendezvous and capture
[NASA-CR-185676] p 3269 N93-29652
Project MEDSAT p 3231 N93-29739
Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads
[NASA-CR-193142] p 3279 N93-29988
Control of nonlinear systems with applications to constrained robots and spacecraft attitude stabilization
p 3279 N93-29989
Attitude stabilization of a rigid spacecraft using two momentum wheel actuators p 3280 N93-29990
Nonlinear attitude control of planar structures in space using only internal controls p 3280 N93-29991
Attitude stabilization of a rigid spacecraft using gas jet actuators operating in a failure mode
p 3280 N93-29992
Utility of a ghost horizon and climb/dive ladder line tapering on a head-up display
[AD-A264401] p 3508 N93-30167
ATTITUDE INDICATORS
Honeywell's compact, wide-angle UV-visible imaging sensor p 3582 N93-28806
Symbology for head up and head down applications for highly agile fighter aircraft: To improve spatial awareness, trajectory control, and unusual attitude recovery, part 1
p 3502 N93-28857
ATTITUDE STABILITY
Refinements on the pinhole camera measurements of the LDEF attitude p 3283 N93-29622
Control of nonlinear systems with applications to constrained robots and spacecraft attitude stabilization
p 3279 N93-29989
Attitude stabilization of a rigid spacecraft using two momentum wheel actuators p 3280 N93-29990
Attitude stabilization of a rigid spacecraft using gas jet actuators operating in a failure mode
p 3280 N93-29992
Space station attitude disturbance arising from internal motions p 3280 N93-29995
AUDIO FREQUENCIES
High pressure studies of hydrated nafion membranes: Dielectric relaxation and deuteron NMR
[AD-A263511] p 3332 N93-29342
AUGER EFFECT
Research studies on short wavelength by selective auger processes
[AD-A264493] p 3440 N93-30401
AURORAL ABSORPTION
Performance statistics bulletin. High latitude meteor scatter propagation, May, June, July 1989
[AD-A264003] p 3399 N93-30757
AURORAL ARCS
Laboratory simulation of field-aligned currents
[NASA-CR-193091] p 3476 N93-28538
AURORAL ELECTROJETS
Results of the joint HIPAS/NUWC campaigns to investigate ELF generated by auroral electrojet modulation p 3398 N93-30746
AURORAS
Electrodynamics of the dayside cleft region based on ground observations at Svalbard
[AD-A263571] p 3477 N93-29831
AUSTENITE
Bainitic stabilization of austenite in low alloy steels
[DE93-008275] p 3321 N93-28957
AUSTENITIC STAINLESS STEELS
Preliminary test of liquid metal induced embrittlement in liquid LiPb and stainless-steel systems
[DE93-753130] p 3320 N93-28529
Transformation plasticity in ductile solids
[DE93-008636] p 3321 N93-28902
Interim fatigue design curves for carbon, low-alloy, and austenitic stainless steels in LWR environments
[DE93-009202] p 3323 N93-29102
A review of hot cracking in austenitic stainless steel weldments
[DE93-605280] p 3328 N93-31021
AUTOCORRELATION
A technique for single-pulse spectrum and pulse width measurements for an IR-FEL
[DE93-007732] p 3436 N93-28847
Operating manual for single-shot autocorrelator
[AD-A262016] p 3438 N93-29395
Parametric likelihood inference for record breaking problems
[AD-A262546] p 3549 N93-29413
Characterization of slow chromophore reorientation in nonlinear optical polymers by two-dimensional MAS NMR
[AD-A264809] p 3338 N93-30596
AUTOIONIZATION
Partial cross sections in H(-) photodetachment
[DE93-011570] p 3569 N93-30130
Research studies on short wavelength by selective auger processes
[AD-A264493] p 3440 N93-30401
AUTOMATA THEORY
Antirational transductions and their language families
[ETN-93-93794] p 3611 N93-28525
Knot invariants and cellular automata
[AD-A264199] p 3607 N93-30884
AUTOMATED EN ROUTE ATC
The Canadian Automated Air Traffic System
p 3246 N93-30323
Procedural development prototype in Automated En Route Air Traffic Control p 3247 N93-30352
AUTOMATIC CONTROL
Natural language generation
[AD-A262578] p 3524 N93-28579
Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies
[AGARD-CP-520] p 3501 N93-28850
Operator and automation capability analysis: Picking the right team p 3503 N93-28864
System automation and pilot-vehicle-interface for unconstrained low-altitude night attack
p 3503 N93-28867
Welding wire pressure sensor assembly
[NASA-CASE-MFS-26216-1] p 3442 N93-28951
An autonomous vision-based mobile robot
p 3443 N93-29082
Lunar crane system p 3277 N93-29118
Remote vehicle survey tool
[DE93-010822] p 3460 N93-29255
Spline screw autochanger
[NASA-CASE-GSC-13435-1] p 3445 N93-29505
Automated modeling of physical systems
[NASA-CR-193256] p 3531 N93-29873
The planning coordinator: A design architecture for autonomous error recovery and on-line planning of intelligent tasks
[NASA-CR-193250] p 3543 N93-30039

A functional system architecture for fully autonomous robot p 3370 N93-30311
Supervised autonomy in telerobotics
p 3372 N93-30326
A multiprocessor architecture for realtime robot control p 3372 N93-30327
Graphical programming: On-line robot simulation for telerobotic control
[DE93-009796] p 3447 N93-30654
An automated data collection system for a Charpy impact tester p 3293 N93-30972

AUTOMATIC LANDING CONTROL
Advanced Transport Operating System (ATOPS) Flight Management/Flight Controls (FM/FC) software description
[NASA-CR-191457] p 3250 N93-28621

AUTOMATIC PILOTS
Analytical foundations of gain scheduling
[AD-A264682] p 3260 N93-30550

AUTOMATIC TEST EQUIPMENT
Standardization of automatic test equipment in the US Air force
[AD-A262076] p 3250 N93-29004
Flight control system design factors for applying automated testing techniques
[NASA-TM-4242] p 3260 N93-30764

AUTOMATION
Radiometric calibration system for IR cameras
[DE93-009237] p 3430 N93-28520
The future role of the Director of Information Management (DOIM) organization within the DOD corporate information management initiative
[AD-A264118] p 3616 N93-30193
Developing automation for terminal air traffic control: Case study of the imaging aid p 3247 N93-30356

AUTOMOBILE ENGINES
The drive to cost-effective structural ceramics
[DE93-009722] p 3335 N93-30047

AUTONOMOUS NAVIGATION
Clementine 2: A double asteroid flyby and impactor mission p 3268 N93-28770
An autonomous vision-based mobile robot
p 3443 N93-29082
On the implementation of the BIRIS range sensor for applications in robotic control and autonomous navigation p 3366 N93-30286

AUTONOMY
Robotics and artificial intelligence for hazardous environments
[DE93-008271] p 3541 N93-29047
Supervised autonomy in telerobotics
p 3372 N93-30326
A multiprocessor architecture for realtime robot control p 3372 N93-30327

AUTOREGRESSIVE PROCESSES
Parameter identification of time-varying systems using neural networks p 3356 N93-30226
Recognizing partially overlapping objects
p 3366 N93-30289

AUXILIARY POWER SOURCES
APU diaphragm testing. Test plan
[NASA-TM-108251] p 3271 N93-29387
APU diaphragm testing
[NASA-TM-108254] p 3272 N93-29501

AVIATION METEOROLOGY
STRATUS: A prototype expert advisory system for terminal weather forecasting p 3367 N93-30296
Meteorological information for aviation: A systems approach p 3367 N93-30298

AVIATION PSYCHOLOGY
Field test of a computer-driven tool to measure psychological characteristics of aircrew
[AD-A264484] p 3499 N93-30425

AVIONICS
A new class of mission support for combat air-crew
p 3501 N93-28854
Standardization of automatic test equipment in the US Air force
[AD-A262076] p 3250 N93-29004
Strategic avionics technology definition studies. Subtask 3-1A: Electrical Actuation (ELA) systems
[NASA-CR-193237] p 3271 N93-29215
Space Generic Open Avionics Architecture (SGOAA) reference model technical guide
[NASA-CR-188246] p 3285 N93-31032

AXIAL FLOW
Fluid flow and heat transfer in the entrance region of an annulus between independently rotating tubes with a turbulent axial flow p 3256 N93-29952

AXIAL FLOW TURBINES
Aero-thermal design of a cooled transonic NGV and comparison with experimental results
p 3257 N93-29957

AXIAL LOADS
Vibration localization in rotating shafts
p 3454 N93-30626
Development of an experimental method to determine the axial rigidity of a strut-node joint
p 3290 N93-30950

AXIAL STRAIN
Stress-intensity-factor influence coefficients for axial and circumferential flaws in reactor pressure vessels
[DE93-006206] p 3454 N93-30213

AXIAL STRESS
Uniaxially stressed Ge:Ga and Ge:Be
[DE93-010426] p 3594 N93-29150
An experimental/analytical evaluation of biaxial sheet failure
[DE93-010620] p 3453 N93-29843

AXISYMMETRIC BODIES
Axial impact of composites p 3297 N93-29078
Numerical computation of inviscid flow around nose tip of Space Shuttle with NND scheme
[AD-A264012] p 3421 N93-29260

AXISYMMETRIC FLOW
Large amplitude striations in an RF discharge
[DE93-753244] p 3379 N93-28534
Accelerated motion of rigid spheres in unsteady flows at low to moderate Reynolds numbers
p 3416 N93-28612
Turbulence characteristics of an axisymmetric reacting flow
[NASA-CR-4110] p 3242 N93-30373
Theoretical studies in nuclear structure
[DE93-012290] p 3570 N93-30505

B

B-1 AIRCRAFT
An evaluation of B-1B pilot performance during simulated instrument approaches with and without status information
[AD-A263874] p 3507 N93-29888

BACKGROUND RADIATION
Spectroscopic probes of vibrationally excited molecules at chemically significant energies
[DE93-012328] p 3564 N93-28652
The emulsion chamber technology experiment
p 3268 N93-28743
The Backgrounds Data Center p 3624 N93-28814
On the meaning of delta T/T
[DE93-008482] p 3653 N93-28962
A program to determine the pointing angle to a specular point
[AD-A262777] p 3630 N93-29460
The 12 UM contribution of nearby galaxies to the infrared background
[AD-A264336] p 3654 N93-30419
Predictions of a non-Gaussian model for large scale structure
[DE93-010196] p 3636 N93-30528

BACKSCATTERING
Ground clutter measurements for surface-sited radar
[AD-A262472] p 3379 N93-28655
Prototype backscatter Moessbauer spectrometer for measurement of Martian surface mineralogy
p 3648 N93-28812
Development of a 9.3 micrometer CW LIDAR for the study of atmospheric aerosol
[NASA-CR-193227] p 3381 N93-29105
Convective and stratiform rain: Multichannel microwave sensing over oceans
[NASA-TM-104586] p 3482 N93-29448
Polarization experiments with hadronic and electromagnetic probes
[DE93-011375] p 3392 N93-30126

BACKWARD FACING STEPS
A grid refinement study of two-dimensional transient flow over a backward-facing step using a spectral-element method
[DE92-018262] p 3417 N93-28639

BACTERIA
Regulation of alternative CO2 fixation pathways in procaryotic and eucaryotic photosynthetic organisms
[DE93-012109] p 3491 N93-29181
Marine microbial production of dimethylsulfide from dissolved dimethylsulfoniopropionate
[NASA-CR-193278] p 3492 N93-30665

BAFFLES
Formulation of Ames 24E2 IR-black coating
[NASA-TM-102864] p 3629 N93-29453

BAINITE
Bainitic stabilization of austenite in low alloy steels
[DE93-008275] p 3321 N93-28957

BALLISTIC MISSILES
Magnetic field measurements of the CEBAF (NIST) wiggler using the pulsed wire method
[AD-A263997] p 3439 N93-29867
Launch vehicles for lightweight TACSAT deployment
p 3271 N93-29903

BALLOON SOUNDING
Stabilized platform for tethered balloon soundings of broadband long- and short-wave radiation
[DE93-007876] p 3383 N93-29308

BALLOON-BORNE INSTRUMENTS
Aerospace payload design and development
[AD-A264502] p 3289 N93-30402

BANACH SPACE
Fixed point iterations for quasi-contractive maps in uniformly smooth Banach spaces
[DE92-641348] p 3552 N93-30942

BANDPASS FILTERS
Improved real-time imaging spectrometer
[NASA-CASE-NPO-18410-1-CU] p 3578 N93-29086
Optically controlled active impedance element particularly suited for a microwave oscillator
[AD-D015723] p 3408 N93-29281
Electro-optic characterisation of extremely wide bandwidth electrical signals
[AD-A264202] p 3392 N93-30145
Characterizing transient vibrations using band limited temporal moments
[DE93-009639] p 3453 N93-30185
Nonlinear processing of phase vocoded speech
p 3355 N93-30219

BANDWIDTH
A microseismometer for terrestrial and extraterrestrial applications p 3434 N93-28765
A comparison of high-speed links, their commercial support and ongoing R/D activities
[DE93-008134] p 3382 N93-29245
Characteristics of high-frequency signals, noise, availability, and duration of bandwidths based on ROTHR Amchitka spectrum measurements
[AD-A264480] p 3393 N93-30423
Bandwidth and SIMDUCE as simulator fidelity criteria
p 3238 N93-30690
A dynamic bandwidth and phase linearity measurement technique for 4-channel MSK VLF antenna systems
p 3398 N93-30748

BARIUM TITANATES
Investigations of self-pumped phase conjugate laser beams and coherence length
[AD-A263438] p 3438 N93-29789
Photorefractive integrators and correlators
[AD-A264200] p 3597 N93-30144
Enhanced photorefractive effects in barium titanate
[AD-A264724] p 3599 N93-30554
Phase transition studies in barium and strontium titanates at microwave frequencies p 3293 N93-30970

BARRIER LAYERS
Inertial confinement fusion target component fabrication and technology development support
[DE93-010836] p 3585 N93-28836

BARYONS
Research programs from the University of South Carolina on high energy physics
[DE93-007829] p 3574 N93-28969
Borel sum rules for octet baryons in nuclear medium
[DE93-753245] p 3604 N93-29242
Baryon number violation and particle collider experiments
[NIKHEF-H/92-14] p 3572 N93-31008

BASE FLOW
Tank issues: Site characterization for external leak monitoring
[PB93-161156] p 3469 N93-29034

BATHYMETERS
Charting the remote southern oceans with geosat altimetry
[AD-A263452] p 3461 N93-29817
A calibration procedure for the SBE 19 Conductivity, Temperature, and Depth (CTD) profiler
[AD-A264435] p 3489 N93-30420

BAYES THEOREM
Information-theoretic performance bounding of Bayesian identifiers
[DE93-010705] p 3554 N93-28763
Information compression in the context model
p 3514 N93-29549
Mixed limit theorems for pattern analysis
[AD-A263735] p 3549 N93-29854
Easy-to-apply results for establishing convergence of Markov chains in Bayesian analysis
[AD-A264015] p 3555 N93-29979
Bayesian linear analysis with application to removal of atmospheric influences on optical remote sensing images
[BCRS-92-19] p 3463 N93-31011

BEACONS
SWAT system performance predictions
[AD-A262857] p 3579 N93-29470
A satellite downlink spread spectrum timing beacon
p 3362 N93-30267

BEAM CURRENTS
Investigation of methods for the measurement of small electron bundle currents
[DIGEL-1992-4] p 3413 N93-30763
A 250 mA toroid monitor for the measurement of the bundle current in the stretcher mode of AmPS
[DIGEL-1992-1] p 3413 N93-30835
Microsecond ribbon relativistic electron beam in a plane undulator and generation of microwave radiation
[DE93-605693] p 3400 N93-30993

BEAM INJECTION
An RF driven H(-) source and a low energy beam injection system for RFQ operation
[DE93-010438] p 3575 N93-29302
High-current negative-ion beam transport
[DE93-010732] p 3575 N93-29809
Measurements of the energy spectrum of an intense microsecond relativistic electron beam in the beam-plasma experiments using a multi-foil analyzer
[DE93-606271] p 3590 N93-30768
Visible light emitting materials and injection devices
[AD-A263499] p 3601 N93-30811
Complex apparatus and results of active experiment Electron-1 with injection of electronic beam in the ionosphere
[DE93-605452] p 3480 N93-30991

BEAM INTERACTIONS
Complex apparatus and results of active experiment Electron-1 with injection of electronic beam in the ionosphere
[DE93-605452] p 3480 N93-30991

BEAM SPLITTERS
Measurement of a Michelson interferometer mirror velocity with a time interval analyzer
[AD-A263009] p 3430 N93-28659
The HYDICE instrument design and its application to planetary instruments p 3434 N93-28766
A compact imaging detector of polarization and spectral content p 3582 N93-28810
Operating manual for single-shot autocorrelator
[AD-A262016] p 3438 N93-29395

BEAMFORMING
Time-interpolation method for digital beamformers
[AD-D015709] p 3383 N93-29275
Recent advances in bootlace lens design
p 3374 N93-30336

BEAMS (SUPPORTS)
Interaction dynamics of on-orbit construction
p 3274 N93-29109
Evaluation of some scale effects in the response and failure of composite beams p 3308 N93-30874

BEARINGS
An analysis of the 70-meter antenna hydrostatic bearing by means of computer simulation p 3386 N93-29601
System for testing bearings
[NASA-CASE-MFS-28589-1] p 3445 N93-29618
Orbital transfer vehicle oxygen turbopump technology. Volume 3: Hot oxygen testing
[NASA-CR-191036] p 3448 N93-31039

BEAT FREQUENCIES
Carbon monoxide exposure of subjects with documented cardiac arrhythmias
[PB93-179943] p 3497 N93-30890

BEAUFORT SEA (NORTH AMERICA)
Leadex data report. Part 2: Rawinsonde and ice station data
[AD-A263218] p 3483 N93-29491

BELL AIRCRAFT
Models for performance assessment of HF antennas on the CH-135/Twin Huey helicopter
p 3366 N93-30291

BEND TESTS
Design and evaluation of a uniaxial pull test for lithium hydride/deuteride
[DE93-010760] p 3451 N93-28832

BENDING
A complete set of field equations for the dynamic simulation of a towed cable system
[AD-A262570] p 3442 N93-28578
Silicon crystal under bending
[DE93-010522] p 3593 N93-28888
Fracture of glass p 3293 N93-30969

BENDING FATIGUE
The effect of temperature on the impact behavior of TiB2 reinforced XDTM-TiAl intermetallic matrix composites
[AD-A262924] p 3296 N93-28886

BENZENE
What is underneath? Moving atoms and molecules to find out
[AD-A263363] p 3567 N93-29332
Performance and cost evaluation of bioremediation techniques for fuel spills
[PB93-175545] p 3474 N93-30762

BERYLLIUM
Measurements of breakaway reaction between beryllium and water vapor for ITER blanket design
[DE93-753270] p 3584 N93-28535
Uniaxially stressed Ge:Ga and Ge:Be
[DE93-010426] p 3594 N93-29150

BERYLLIUM ALLOYS
Deformation mechanisms in Be(sub 12)X compounds
[DE93-009080] p 3320 N93-28548

BERYLLIUM COMPOUNDS
Be3(AsO4)2 2H2O: A new berylloarsenate phase containing bridged tetrahedral 3-rings
[AD-A262518] p 3592 N93-28584

BERYLLIUM 10
Cosmogenic radionuclides on LDEF: An unexpected Be-10 result p 3573 N93-29643

BETA PARTICLES
Neutrino mass
[DE93-010735] p 3566 N93-29315

BETHE-SALPETER EQUATION
General method for reducing the two-body Dirac equation
[DE93-609833] p 3607 N93-30943

BEVERAGES
Field trial of caffeine on physical performance at altitude: An attempt to overcome the challenge
[AD-A264260] p 3497 N93-30894

BIAS
Measurement of the relative and absolute microgravity environment of space platforms, recent flight results, and determination of the spatial microgravity field
p 3266 N93-28725
Growth, characterization and device development in monocrystalline diamond films
[AD-A263204] p 3593 N93-28874
Evaluating the bias of alternative cost progress models: Tests using aerospace industry acquisition programs
[AD-A262870] p 3624 N93-29477

BIBLIOGRAPHIES
Energy efficient drivepower, volume 2
[DE93-012437] p 3410 N93-29814
Energy efficient drivepower
[DE93-012436] p 3411 N93-30058
An annotated bibliography on integration in software engineering environments
[AD-A264798] p 3535 N93-30602

BIDIRECTIONAL REFLECTANCE
Modeling the bidirectional reflectance and spectra
[AD-A263570] p 3462 N93-29830

BIG BANG COSMOLOGY
Tests of the particle physics-physical cosmology interface
[DE93-008483] p 3634 N93-28963

BINARY ALLOYS
Some effects of composition and microstructure on the B2 in equilibrium to DO3 ordered phase transition in Fe3Al alloys
[DE93-009724] p 3325 N93-29813
Effective interactions between concentration fluctuations and charge transfer in chemically ordering liquid alloys
[DE93-606724] p 3327 N93-30778

BINARY DATA
Wideband propagation measurements for wireless indoor communication
[PB93-175123] p 3382 N93-29202
Incomplete fuzzy data processing systems using artificial neural network p 3519 N93-29578
Massively parallel spatial light modulation-based optical signal processing
[AD-A264846] p 3581 N93-30905

BINARY FLUIDS
Loading and testing a light scattering cell with a binary fluid mixture near its critical composition
[NASA-CR-193147] p 3415 N93-28557

BINARY PHASE SHIFT KEYING
Wideband propagation measurements for wireless indoor communication
[PB93-175123] p 3382 N93-29202

BINARY STARS
Stellar encounters in globular clusters
p 3632 N93-28606
The multiplicity of T Tauri stars in the star forming regions Taurus-Auriga and Ophiuchus-Scorpius: A 2.2 micron speckle imaging survey p 3634 N93-28945
Effects of spiral shocks on disk emission lines
[DE92-641716] p 3637 N93-31004

BINDERS (MATERIALS)
Thermal control paints on LDEF: Results of M0003 sub-experiment 18
[AD-A263252] p 3329 N93-28561
An evaluation of factors affecting the solidification/stabilization of heavy metal sludge
[AD-A264128] p 3473 N93-30197

BINOCULAR VISION
Binocular spherical disparity: A study in representation for a forward translating camera
[PB93-184422] p 3579 N93-29667
Intermediate levels of visual processing
[AD-A264117] p 3495 N93-30192

BINOMIALS
Fluctuations and intermittency in high energy nucleus-nucleus collisions
[DE93-608481] p 3577 N93-30990

BIOCHEMISTRY
Clouds and radiation: A primier
[AD-A263136] p 3482 N93-29479
Solar world congress: Proceedings of the biennial congress of the international solar energy society, volume 1, part 2
[PB93-174779] p 3465 N93-30001
Biophysical and biochemical mechanisms in synaptic transmitter release
[AD-A264829] p 3496 N93-30613

BIOCONTROL SYSTEMS
Cognitive and Neural Sciences Division 1992 programs
[AD-A263400] p 3654 N93-29258

BIOCONVERSION
Introductions to the Proceedings of the Fourteenth Symposium on Biotechnology for Fuels and Chemicals
[DE93-006235] p 3490 N93-28890

BIODYNAMICS
Anthropometric survey of the astronaut applicants and astronauts from 1985 to 1991
[NASA-RP-1304] p 3506 N93-29324
Visualization techniques for analyzing control of human movement: Affine mappings between multi-dimensional spaces p 3508 N93-30204

BIOELECTRIC POTENTIAL
An assessment of peripheral nerve damage in the rat following non-freezing cold exposure: An electrophysiological and histopathological examination
[AD-A264293] p 3492 N93-30818

BIOINSTRUMENTATION
Transcutaneous analyte measuring methods
[AD-A262861] p 3494 N93-29509
Acquisition of physiological data during G-induced Loss of Consciousness (G-LOC)
[AD-A264492] p 3496 N93-30400

BIOLOGICAL EFFECTS
Predicting the response of a temperate forest ecosystem to atmospheric CO2 increase
[DE93-010081] p 3467 N93-28543
Gene transcription and electromagnetic fields
[DE93-010854] p 3490 N93-28848
State of the art: Ecological biomarkers
[DE93-006621] p 3469 N93-28992
Theoretical-experimental study of the non-thermal effects of the polarized laser radiation in living tissues
[DE93-607212] p 3441 N93-30775

BIOLOGICAL EVOLUTION
A robust model for finding optimal evolutionary trees
[DE93-010682] p 3491 N93-30483

BIOLOGICAL MODELS (MATHEMATICS)
Comparative mutagenesis of human cells in vivo and in vitro
[DE93-012269] p 3490 N93-28651
Sudden loading and fatigue effects on the human spine
[PB93-167526] p 3493 N93-29199
Modelling and simulation of human retinal vision processing p 3363 N93-30269
Parallel processing and learning: Variability and chaos in self-organization of activity in groups of neurons
[AD-A264224] p 3539 N93-30361
A robust model for finding optimal evolutionary trees
[DE93-010682] p 3491 N93-30483
A simple computational model of center-surround receptive fields in the retina
[AD-A264723] p 3496 N93-30515
Principal components of natural images: An analytical solution
[AD-A264800] p 3489 N93-30603

BIOMASS
Introductions to the Proceedings of the Fourteenth Symposium on Biotechnology for Fuels and Chemicals
[DE93-006235] p 3490 N93-28890
Design of biomass management systems and components for closed loop life support systems
p 3230 N93-29728

BIOMEDICAL DATA
The Visible Human Project of the National Library of Medicine: Remote access and distribution of a multi-gigabyte data set p 3617 N93-30453

BIOPHYSICS
Gene transcription and electromagnetic fields
[DE93-010854] p 3490 N93-28848
Biophysical model for handwear insulation testing
[AD-A262926] p 3505 N93-28884

Biophysical and biochemical mechanisms in synaptic transmitter release
[AD-A264829] p 3496 N93-30613

BIOTECHNOLOGY
Proceedings of a Workshop on Molecular Nuclear Medicine
[DE93-010828] p 3493 N93-28835
Center of Excellence in Biotechnology (Research)
[AD-A263598] p 3491 N93-29915
Solar world congress: Proceedings of the biennial congress of the international solar energy society, volume 1, part 2
[PB93-174779] p 3465 N93-30001

BIPOLAR TRANSISTORS
Analysis of electrothermal interactions in power semiconductor modules
[ETN-93-93800] p 3591 N93-28470
Charge separation in bipolar transistors
[DE93-009624] p 3413 N93-30650
Hardness assurance and testing issues for bipolar/BiCMOS devices
[DE93-009623] p 3570 N93-30669

BIPOLARITY
A simple computational model of center-surround receptive fields in the retina
[AD-A264723] p 3496 N93-30515

BIREFRINGENCE
A compact imaging detector of polarization and spectral content p 3582 N93-28810

BISMUTH OXIDES
The effect of Bi2 O3 on the electrical properties of Zr O2: 3 percent Mg O ceramic solid electrolytes
[DE93-607029] p 3339 N93-30774

BIT ERROR RATE
Theoretical bit error rate performance of the Kalman filter excisor for FM interference
[AD-A263018] p 3383 N93-29407
Signal-to-noise ratio losses in full spectrum combining of signals with a downconverted subcarrier
p 3386 N93-29599

BLACK HOLES (ASTRONOMY)
Topics in General Relativity theory: Gravitational-wave measurements of black-hole parameters; gravitational collapse of a cylindrical body; and classical-particle evolution in the presence of closed, timelike curves
p 3603 N93-28690
Electric magnetic duality in string theory
[DE93-606061] p 3606 N93-30807
Effects of spiral shocks on disk emission lines
[DE92-641716] p 3637 N93-31004

BLADE SLAP NOISE
Strong parallel blade-vortex interaction and noise propagation in helicopter flight p 3563 N93-30980

BLADE TIPS
Aerodynamic characteristics of a rotorcraft airfoil designed for the tip region of a main rotor blade
[NASA-TM-4264] p 3240 N93-29450

BLADE-VORTEX INTERACTION
Computation of far-field helicopter rotor tone noise
[ONERA-P-1990-5] p 3562 N93-30110
Strong parallel blade-vortex interaction and noise propagation in helicopter flight p 3563 N93-30980

BLANKETS (FUSION REACTORS)
Measurements of breakaway reaction between beryllium and water vapor for ITER blanket design
[DE93-753270] p 3584 N93-28535

BLAST LOADS
Mitigation of shock waves in a cylindrical tunnel by foam
[AD-A262491] p 3423 N93-29419

BLOCK COPOLYMERS
Gas permeability of E/EP semicrystalline diblock copolymers
[AD-A263241] p 3329 N93-28560

BLOCK DIAGRAMS
Technical examination and simulation of a photovoltaic system: Solar generator, battery, download
[ETN-93-94179] p 3466 N93-30573

BLOOD
Transcutaneous analyte measuring methods
[AD-A262861] p 3494 N93-29509

BLOOD FLOW
Pharmacokinetics and Pharmacodynamics in Space
[NASA-CP-10048] p 3494 N93-29502

BLUE STARS
Why Blue stragglers formed via collisions may not be rapid rotators
[DE93-008708] p 3633 N93-28905
Do the Pop 2 field blue stragglers have a collisional origin?
[DE93-008709] p 3634 N93-28906
Can physical stellar collisions explain the blue stragglers in the dwarf spheroidal galaxies?
[DE93-008711] p 3634 N93-28907

BLUFF BODIES
Vortex shedding by blunt/bluff bodies at high reynolds numbers. Volume 1: Data analysis
[AD-A264151] p 3241 N93-30171
Vortex shedding by Blunt/Bluff bodies at high reynolds numbers. Volume 2: Cylinders, octagon, hexagon
[AD-A264152] p 3241 N93-30172
Vortex shedding by blunt/bluff bodies at high reynolds numbers. Volume 3. Cubes
[AD-A264153] p 3242 N93-30173

BLUNT BODIES
Hypersonic lateral and directional stability characteristics of aeroassist flight experiment configuration in air and CF4
[NASA-TM-4435] p 3239 N93-29166
Vortex shedding by blunt/bluff bodies at high reynolds numbers. Volume 1: Data analysis
[AD-A264151] p 3241 N93-30171
Vortex shedding by Blunt/Bluff bodies at high reynolds numbers. Volume 2: Cylinders, octagon, hexagon
[AD-A264152] p 3241 N93-30172
Vortex shedding by blunt/bluff bodies at high reynolds numbers. Volume 3. Cubes
[AD-A264153] p 3242 N93-30173

BOATS
Development of a test program to evaluate structural defects in Glass-Reinforced Plastic (GRP), volume 2
[AD-A263814] p 3335 N93-29881

BODIES OF REVOLUTION
Axial impact of composites p 3297 N93-29078
Representation and recognition with invariants and geometric constraint models
[AD-A263235] p 3529 N93-29493
The application of concentric vortex simulation to calculating the aerodynamic characteristics of bodies of revolution at high angles of attack
[AD-A263879] p 3241 N93-29919

BODY CENTERED CUBIC LATTICES
The role of grain boundaries in hydrogen diffusion in metals at 25 C
[NASA-TM-108407] p 3322 N93-29043
Order-disorder transformations in Ni-Al alloys
[DE93-009293] p 3326 N93-30389

BODY TEMPERATURE
Influence of the Cold Buster (tm) sports bar on heat debt, mobilization and oxidation of energy substrates
[AD-A262762] p 3493 N93-28939
Evaluation of personal cooling systems in conjunction with explosive ordnance disposal suits
[AD-A262862] p 3506 N93-29471

BODY WEIGHT
Field trial of caffeine on physical performance at altitude: An attempt to overcome the challenge
[AD-A264260] p 3497 N93-30894

BOEING 757 AIRCRAFT
Vortex wake characteristics of B757-200 and B767-200 aircraft using the tower fly-by technique
[PB93-180255] p 3242 N93-30387
Vortex wake characteristics of B757-200 and B767-200 aircraft using the tower fly-by technique
[PB93-180263] p 3242 N93-30388

BOEING 767 AIRCRAFT
Vortex wake characteristics of B757-200 and B767-200 aircraft using the tower fly-by technique
[PB93-180255] p 3242 N93-30387
Vortex wake characteristics of B757-200 and B767-200 aircraft using the tower fly-by technique
[PB93-180263] p 3242 N93-30388

BOILING WATER REACTORS
Annual progress report on the NSRR experiments, (21)
[DE93-753190] p 3574 N93-29137
TRAB: A transient analysis program for BWR. Part 2: User's manual
[VTT-TIED-1232-PT-2] p 3575 N93-29996

BOLOMETERS
Novel low temperature superconducting bolometers
[DE93-010433] p 3430 N93-28664
Superconducting submillimeter and millimeter wave detectors
[DE93-007656] p 3431 N93-29149
Submillimeter and microwave residual losses in epitaxial films of Y-Ba-Cu-O and Tl-Ca-Ba-Cu-O
[DE93-010430] p 3596 N93-29868

BOLTS
The design and lifetime calculation of MHD generator walls based on subcritical crack growth in ceramics
[ISBN-90-9004009-9] p 3332 N93-29267
Mold bolt and means for achieving close tolerances between bolts and bolt holes
[NASA-CASE-MFS-28720-1] p 3447 N93-30567
Effects of bolt-hole contact on bearing-bypass damage-onset strength p 3307 N93-30870

BOLTZMANN TRANSPORT EQUATION
Optimization of HPM device parameters for maximum air transmission
[DE93-007332] p 3386 N93-29765

BOLTZMANN-VLASOV EQUATION
Numerical modelling of the cold plasma with time-dependent, magnetohydrodynamic methods
[KFK-5053] p 3586 N93-29081

BOMBARDMENT
A unique photon bombardment system for space applications p 3286 N93-28790

BONDED JOINTS
Diffusion bonding
[DE93-011480] p 3442 N93-28837

BONDING
Tailored interfaces for metal-matrix composites-fundamental considerations
[AD-A263048] p 3298 N93-29130
Observation of phase-separated nanometer scale molecular domains in mixed self-assembled monolayers
[AD-A263470] p 3569 N93-29839
Structure, adhesion, and stability of metal/oxide and oxide/oxide interfaces
[DE93-012930] p 3325 N93-30060
Applications of density functional theory to calculation of reaction energetics p 3351 N93-30098

BOOLEAN ALGEBRA
Modeling the bidirectional reflectance and spectra
[AD-A263570] p 3462 N93-29830
Efficient algorithms and data structures in geometric design
[AD-A264678] p 3534 N93-30544
Manifold shape: From differential geometry to mathematical morphology
[CS-9204] p 3552 N93-31012
Short-circuit evaluation of Boolean expressions
[CS-9205] p 3552 N93-31014

BORATES
The synthesis and ab initio structure determination of Zn4O(BO3)2: A microporous zincoborate built up from fused 3-ring and 5-ring sub-units
[AD-A262504] p 3594 N93-29138
Synthesis and characterization of mixed 3-5 and 2-6 semiconductor monomers included in the borate sodalite analogue
[AD-A264523] p 3598 N93-30407

BORESIGHT ERROR
Gravity referenced elevation encoder development
p 3385 N93-29592

BORESIGHTS
Cryogenic magnetic bearing
[AD-A264716] p 3446 N93-30512

BORON CARBIDES
Boron carbide aluminum cermets for external pressure housing applications
[AD-A262749] p 3333 N93-29404

BORON FLUORIDES
Efficient laser action from two CW laser pumped pyrromethene-BF2 complexes
[AD-A264887] p 3441 N93-30910

BORON REINFORCED MATERIALS
SESAME equation of state number 8010: Boron loaded silicone potting material
[DE93-012083] p 3300 N93-30395

BOROSILICATE GLASS
Large amplitude striations in an RF discharge
[DE93-753244] p 3379 N93-28534
Healing of lithographically introduced flaws in glass and glass containing ceramics
[DE93-010453] p 3330 N93-28761
Thermal certification tests of Orbiter Thermal Protection System tiles coated with KSC coating slurries
[NASA-TM-104766] p 3278 N93-29221

BOSONS
Massive Majorana neutrinos in pre-bounce supernovae
[DE92-642597] p 3572 N93-30931

BOUNDARIES
Information-theoretic performance bounding of Bayesian identifiers
[DE93-010705] p 3554 N93-28763
Detecting residue on a printed circuit board: An application of the Boundary Contour/Feature Contour System
[DE93-006283] p 3412 N93-30370

BOUNDARY CONDITIONS
Dense inclined flows: Theory and experiments
[DE93-011452] p 3417 N93-28630
Design optimization of space structures
p 3278 N93-29122
Fundamental studies of impingement cooling thermal boundary conditions p 3254 N93-29940
Geometrical approach to the dynamics of a relativistic string in the D-dimensional Minkowski space
[DE93-606071] p 3605 N93-30784

Numerical wave propagation and steady-state solutions p 3428 N93-30999

BOUNDARY ELEMENT METHOD
Nonlinear analyses of composite aerospace structures in sonic fatigue [NASA-CR-193124] p 3451 N93-29154

BOUNDARY INTEGRAL METHOD
Analysis of thermal bar using boundary-layer integral equations gradients [MATHS-REPT-A-177] p 3462 N93-30107

BOUNDARY LAYER CONTROL
The numerical simulation of circulation controlled airfoil flowfields p 3243 N93-30947

BOUNDARY LAYER FLOW
State vector splitting: A numerical scheme for the Euler equations p 3419 N93-29039
Flow visualization on helicopter blades using acenaphthen [ESA-TT-1255] p 3422 N93-29273
Experimental study of heat transfer close to a plane wall heated in the presence of multiple injections (subsonic flow) p 3253 N93-29931
Measurement of turbulent spots and intermittency modelling at gas-turbine conditions p 3253 N93-29934
Heat transfer in high turbulence flows: A 2-D planar wall jet p 3254 N93-29935
Analytical and experimental study of laminar free convective heat transfer from isothermal convex bodies of arbitrary shape [ISBN-0-315-72512-5] p 3426 N93-30379

BOUNDARY LAYER PLASMAS
Modeling the D3-D plasma boundary with the LEDGE code [DE93-009301] p 3588 N93-29772

BOUNDARY LAYER SEPARATION
Measurements of breakaway reaction between beryllium and water vapor for ITER blanket design [DE93-753270] p 3584 N93-28535
An experimental study of flow over a 6 to 1 prolate spheroid at incidence p 3239 N93-29124
The 3-D viscous flow CFD analysis of the propeller effect on an advanced ducted propeller subsonic inlet [NASA-TM-106240] p 3252 N93-29162
High-Reynolds-number test of a 5-percent-thick low-aspect-ratio semispan wing in the Langley 0.3-meter transonic cryogenic tunnel: Wing pressure distributions [NASA-TM-4227] p 3240 N93-29449
Vortex structure and mass transfer near the base of a cylinder and a turbine blade p 3253 N93-29929

BOUNDARY LAYER TRANSITION
Keynote address: Unsteady, multimode transition in gas turbine engines p 3252 N93-29927
Determination of surface heat transfer and film cooling effectiveness in unsteady wake flow conditions p 3253 N93-29933
Measurement of turbulent spots and intermittency modelling at gas-turbine conditions p 3253 N93-29934

BOUNDARY LAYERS
Thermal and mechanical analysis of flip-chips on a liquid cooled multichip module [DE93-007609] p 3405 N93-28641
Development of an unstructured solution adaptive method for the quasi-three-dimensional Euler and Navier-Stokes equations [NASA-CR-193241] p 3421 N93-29213
Heat transfer with moderate free stream turbulence p 3254 N93-29936
Analysis of thermal bar using boundary-layer integral equations gradients [MATHS-REPT-A-177] p 3462 N93-30107

BOUNDARY LUBRICATION
A study of the chemical mechanism in lubrication [DE93-012230] p 3330 N93-28650

BOUNDARY VALUE PROBLEMS
The wave, the cylinder, and the plate [DE93-009458] p 3450 N93-28596
Representation and recognition with invariants and geometric constraint models [AD-A263235] p 3529 N93-29493
Algorithms for point set congruence [AD-A264016] p 3532 N93-29980
Geometrical approach to the dynamics of a relativistic string in the D-dimensional Minkowski space [DE93-606071] p 3605 N93-30784
On the invariant measure for the nonlinear Schroedinger equation [DE92-644672] p 3551 N93-30912
A numerical solution of the two-center problem [DE92-644674] p 3551 N93-30913

BOUSSINESQ APPROXIMATION
High performance dispersion model PHYSIC [DE93-753303] p 3467 N93-28536

BOW WAVES
Kinetics and energy transfer in nonequilibrium fluid flows [AD-A263612] p 3240 N93-29284

BOX BEAMS
Design, analysis, and fabrication of the technology integration box beam p 3300 N93-30433

BRAIDED COMPOSITES
Environmental effects on stitched RTM composites [NASA-CR-193221] p 3297 N93-29107

BRAIN
The AFOSR Workshop on the Future of EEG and MEG [AD-A264338] p 3495 N93-30160

BRAIN CIRCULATION
Acquisition of physiological data during G-induced Loss of Consciousness (G-LOC) [AD-A264492] p 3496 N93-30400

BRAIN DAMAGE
The AFOSR Workshop on the Future of EEG and MEG [AD-A264338] p 3495 N93-30160

BRAKES (FOR ARRESTING MOTION)
Single acting translation/rotational brake [NASA-CASE-LAR-14738-1] p 3443 N93-29175

BRANCHING (MATHEMATICS)
A normally elliptic Hamiltonian bifurcation [W-9201] p 3548 N93-28753
Bifurcations phenomena in a nonlinear oscillator: Approximate analytical studies versus computer simulation results p 3407 N93-29037
Short-circuit evaluation of Boolean expressions [CS-9205] p 3552 N93-31014

BRASSES
An experimental investigation of radioactivity induced by ions associated with the operation of pulsed-power accelerators [DE93-011478] p 3575 N93-29151

BRAZING
A transient FGM interlayer based approach to joining ceramics [DE93-010415] p 3331 N93-29248
Direct use geothermal applications for brazed plate heat exchangers [DE93-008559] p 3465 N93-30011

BREEDER REACTORS
Annual progress report on the NSRR experiments, (21) [DE93-753190] p 3574 N93-29137

BREEDING (REPRODUCTION)
Preliminary test of liquid metal induced embrittlement in liquid LiPb and stainless-steel systems [DE93-753130] p 3320 N93-28529
Measurements of breakaway reaction between beryllium and water vapor for ITER blanket design [DE93-753270] p 3584 N93-28535

BREMSSTRAHLUNG
Hard photon emission from high energy electrons and positrons in single crystals [DE93-606328] p 3600 N93-30770

BRIGHTNESS
Discomfort glare from high-intensity discharge headlamps: Effects of context and experience [PB93-174720] p 3496 N93-30659

BRITTLE MATERIALS
Three-dimensional elastic stress analysis in materials with many inhomogeneities [AD-A263736] p 3453 N93-29855
Fracture of glass p 3293 N93-30969

BRITTLENESS
Environmental embrittlement of binary and Zr-doped Ni3Al [DE93-008575] p 3321 N93-28679
Materials characterization of cermet anodes tested in a pilot cell [DE93-008924] p 3323 N93-29101
Preliminary properties of a resin from ethynyl terminated materials p 3303 N93-30842

BROADBAND
Wideband propagation measurements for wireless indoor communication [PB93-175123] p 3382 N93-29202
Electro-optic characterisation of extremely wide bandwidth electrical signals [AD-A264202] p 3392 N93-30145
Topical meeting of broadband analog and digital optoelectronics [AD-A264643] p 3581 N93-30522
Ultrafast, passive, broad-band, optical shutter based on novel semiconductor/conducting polymer interfaces [AD-A264098] p 3601 N93-30878

BROADBAND AMPLIFIERS
Wide-bandwidth high-resolution search for extraterrestrial intelligence [NASA-CR-193137] p 3509 N93-28895

BROKEN SYMMETRY
Flux lattice relaxation, noise, and symmetry-breaking in frustrated Josephson junction arrays [DE93-008713] p 3593 N93-29094
Theoretical studies in nuclear structure [DE93-012290] p 3570 N93-30505
Phase structure of three- and four-dimensional phi(exp 4) field theory [DE93-606069] p 3605 N93-30782
Schroedinger equations of higher (greater than 2) order [DE92-644677] p 3552 N93-30984

BROMINE
Photodissociation of HBr/LiF(001): A quantum mechanical model [NASA-CR-193119] p 3603 N93-28933

BRONCHI
The chronic effects of jP-8 jet fuel exposure on the lungs [AD-A264162] p 3495 N93-30153

BROWNIAN MOVEMENTS
A microseismometer for terrestrial and extraterrestrial applications p 3434 N93-28765
Simulation and calculation of diffusive aerosol deposition [DE93-007518] p 3474 N93-30506

BRUSH SEALS
Preliminary experimental results for a cryogenic brush seal configuration [NASA-TM-106236] p 3416 N93-28627

BSCCO SUPERCONDUCTORS
Effect of lead addition on the formation of superconducting phases in Bi-Sr-Ca-Cu-O ceramics [DE93-606893] p 3339 N93-30773

BUBBLES
A four-field approach towards developing a mechanistic model for multiphase flow [DE93-006572] p 3420 N93-29126
Horizontal nucleate flow boiling heat transfer coefficient measurements and visual observations for R12, R134a, and R134a/ester lubricant mixtures [PB93-178598] p 3475 N93-30887

BUCKLING
Integrated approaches to parallelism in optimization and solution of inverse problems [AD-A262259] p 3452 N93-29349
Design and analysis of grid stiffened concepts for aircraft composite primary structural applications p 3306 N93-30861
Experimental behavior of graphite-epoxy Y-stiffened specimens loaded in compression p 3307 N93-30872

BUDGETING
A perspective on acquisition of NASA space systems [AD-A263246] p 3610 N93-29499
Air Force CALS business practices [AD-A264789] p 3610 N93-30177

BUFFER STORAGE
Compiler-assisted multiple instruction rollback recovery using a read buffer [NASA-CR-193175] p 3527 N93-29170

BUILDINGS
Concept design example, Computer Aided Structural Modeling (CASM). Scheme A [AD-A264759] p 3529 N93-29657
Concept design example, Computer Aided Structural Modeling (CASM). Scheme B [AD-A264760] p 3529 N93-29658
Rocket-triggered lightning studies for the protection of critical assets [DE93-009633] p 3484 N93-30651
ELF/VLF spectrum measurements p 3398 N93-30745

BUNDLES
Characterization of a space orbited incoherent fiber optic bundle p 3583 N93-29698
Powder towpreg process development p 3303 N93-30844

BUOYANCY
Macrostatistical hydrodynamics [DE93-012289] p 3417 N93-28751
Turbulent flow and heat transfer in idealized blade cooling passages p 3254 N93-29938
Effects of buoyancy on gas jet diffusion flames [NASA-CR-191109] p 3352 N93-31031

BYPASSES
Valve malfunction detection apparatus [NASA-CASE-MFS-29904-1] p 3432 N93-29503

C

C (PROGRAMMING LANGUAGE)
Proposal for a numerical array library [DE93-010678] p 3623 N93-30482

C BAND

Study of gain in C-band deflection cavities for a frequency-doubling magnicon amplifier
[AD-A263132] p 3409 N93-29478

C++ (PROGRAMMING LANGUAGE)

A C++ interface for programming on the Connection Machine
[INRIA-RR-1698] p 3538 N93-29487

Proposal for a numerical array library
[DE93-010678] p 3623 N93-30482

CABLES (ROPES)

Theoretical and experimental investigation of slack cable/mass system dynamics p 3455 N93-31028

CADMIUM ALLOYS

Proceedings of Symposium F on New Aspects on the Growth, Characterization and Applications of CdTe and related Cd rich alloys 5, 1992
[AD-A263541] p 3597 N93-29974

CADMIUM SELENIDES

Electrochemical fabrication of cadmium chalcogenide microdiode arrays
[AD-A263169] p 3310 N93-28988

Nonequilibrium screening and exciton dynamics probed by femtosecond laser pulses
[AD-A263603] p 3439 N93-29983

CADMIUM TELLURIDES

Electrochemical fabrication of cadmium chalcogenide microdiode arrays
[AD-A263169] p 3310 N93-28988

Proceedings of Symposium F on New Aspects on the Growth, Characterization and Applications of CdTe and related Cd rich alloys 5, 1992
[AD-A263541] p 3597 N93-29974

CAFFEINE

Field trial of caffeine on physical performance at altitude: An attempt to overcome the challenge
[AD-A264260] p 3497 N93-30894

CALCIUM COMPOUNDS

The effect of oxidation embrittlement on the impact behavior of nicalon reinforced CAS 2 ceramic matrix composites
[AD-A263567] p 3334 N93-29829

CALIBRATING

Radiometric calibration system for IR cameras
[DE93-009237] p 3430 N93-28520

The HYDICE instrument design and its application to planetary instruments p 3434 N93-28766

Program for an improved hypersonic temperature-sensing probe
[NASA-CR-186025] p 3431 N93-29066

Enhanced reduction of velocity data obtained during CETA flight experiment
[NASA-TM-4460] p 3431 N93-29209

Graphical interface between the CIRSSE testbed and CimStation software with MCS/CTOS
[NASA-CR-193276] p 3527 N93-29218

Preprocessing airborne remote sensing PARES calibration maintenance functional design document
[BCRS-92-07] p 3460 N93-29321

Transient response of embedded thermocouples
[DE93-009889] p 3431 N93-29325

Selection and static calibration of the Marsh J1678 pressure gauge p 3249 N93-29779

What is the center of the image?
[AD-A263550] p 3579 N93-29824

The possible direct use of satellite radiance measurements by the Atmospheric Radiation Measurement Program
[DE93-009819] p 3462 N93-30049

A calibration procedure for the SBE 19 Conductivity, Temperature, and Depth (CTD) profiler
[AD-A264435] p 3489 N93-30420

VLF/LF propagation measurements
p 3395 N93-30732

Satellite calibration requirements
[AD-A264279] p 3281 N93-30817

Physics laboratory technical activities, 1992
[PB93-178648] p 3561 N93-30888

ERS-1 directional wave spectra validation with the airborne SAR PHARS
[BCRS-92-18] p 3463 N93-31010

CALIFORNIA

Tidal and lunar data for Point Mugu, San Nicolas island, and the Barking Sands area during 1993
[AD-A262725] p 3477 N93-29401

Fugitive hydrocarbon emissions from Pacific OCS facilities. Volume 2: Executive summary and user's guide
[PB93-173805-VOL-2] p 3471 N93-29861

CALORIMETERS

Studies of relativistic heavy ion collisions at the AGS (E814/E877)
[DE93-008541] p 3564 N93-28678

The emulsion chamber technology experiment
p 3268 N93-28743

Measurement of W-Z interference from neutrino-electron scattering
[DE93-010724] p 3566 N93-29313

CAMBER

A comparison of classical mechanics models and finite element simulation of elastically tailored wing boxes
p 3306 N93-30863

CAMERAS

Radiometric calibration system for IR cameras
[DE93-009237] p 3430 N93-28520

Vision-based control of holonomic robots for 3-dimensional rigid-body positioning using camera-space manipulation p 3578 N93-29178

Binocular spherical disparity: A study in representation for a forward translating camera
[PB93-184422] p 3579 N93-29667

What is the center of the image?
[AD-A263550] p 3579 N93-29824

CAMS

Experimental and analytical investigation of finger-follower cam systems p 3446 N93-30378

CANADA

Canadian Conference on Electrical and Computer Engineering, volumes 1 and 2
[ISBN-0-9694170-1-2] p 3354 N93-30215

VLF propagation measurements in the Canadian Arctic p 3396 N93-30733

CANADIAN SPACECRAFT

Canadian EHF MILSATCOM research and development project p 3362 N93-30264

FASSET: A development model for a Canadian EHF MILSATCOM system p 3363 N93-30268

CANARD CONFIGURATIONS

Effect of canard wing positions on aerodynamic characteristics of swept-forward wing
[AD-A262373] p 3238 N93-28493

CANOPIES

Wind loads on canopy roofs
[RR-CE132] p 3451 N93-29106

CANOPIES (VEGETATION)

Remote sensing of agricultural vegetation: Status and perspectives p 3458 N93-28922

Modeling the bidirectional reflectance and spectra
[AD-A263570] p 3462 N93-29830

CAPACITORS

Adhesion of thick film Au to alumina ceramics
[DE93-009802] p 3339 N93-30656

CAPE KENNEDY LAUNCH COMPLEX

Guide for certifying pressure vessels and systems
[NASA-TM-107549] p 3449 N93-29220

CAPILLARY FLOW

Pulse mitigation and heat transfer enhancement techniques. Volume 5: Transient liquid movement in heat pipe wicks
[AD-A264513] p 3426 N93-30403

CAPILLARY TUBES

Velocity measurements of low Reynolds number tube flow using fiber-optic technology
[DE93-009865] p 3422 N93-29335

Improved heat removal by microscopic surface texturing of capillaries
[AD-A263483] p 3424 N93-29966

CAPILLARY WAVES

Optical measurements of ripples using a scanning laser slope gauge. Part 1: Instrumentation and preliminary results
[AD-A261939] p 3486 N93-28996

The IUTAM Symposium on Breaking Waves
[AD-A264196] p 3489 N93-30143

CARBENES

Laser spectroscopy of hydrocarbon radicals
[DE93-012555] p 3436 N93-28653

CARBOHYDRATE METABOLISM

Influence of the Cold Buster (tm) sports bar on heat debt, mobilization and oxidation of energy substrates
[AD-A262762] p 3493 N93-28939

CARBON

The design and testing of a high-temperature graphite dilatometer
[AD-A262185] p 3430 N93-28488

Research and development of carbon black anodes for lithium secondary cells
[DE93-781331] p 3406 N93-28746

Ocean Margins Program
[DE93-008937] p 3470 N93-29262

Hypervelocity impact survivability experiments for carbonaceous impactors p 3283 N93-29364

Experiment and analysis on elastic deformation properties of graphite and carbon materials for HTTR core components
[DE93-753271] p 3299 N93-30004

Diamond nucleation of surfaces using carbon clusters
[AD-A264634] p 3599 N93-30548

Study on diamond semiconductor
[DE92-531076] p 3413 N93-30622

CARBON CYCLE

Activities report of the International Meteorological Institute, Stockholm (Sweden)
[ETN-93-93768] p 3480 N93-28519

Steady-state and transient modeling of tracer and nutrient distributions in the global ocean
[DE93-011043] p 3486 N93-28670

Ocean Margins Program
[DE93-008937] p 3470 N93-29262

Fiber optic chemical sensors for characterizing the carbon cycle in ocean margin regions
[DE93-011442] p 3489 N93-30056

CARBON DIOXIDE

Predicting the response of a temperate forest ecosystem to atmospheric CO2 increase
[DE93-010081] p 3467 N93-28543

Steady-state and transient modeling of tracer and nutrient distributions in the global ocean
[DE93-011043] p 3486 N93-28670

Alkali metal carbon dioxide electrochemical system for energy storage and/or conversion of carbon dioxide to oxygen
[NASA-CASE-LEW-14973-1] p 3464 N93-28974

Regulation of alternative CO2 fixation pathways in procaryotic and eucaryotic photosynthetic organisms
[DE93-012109] p 3491 N93-29181

Growing wheat to maturity in reduced gas pressures
[NASA-CR-193245] p 3491 N93-29216

Acid gas treating by aqueous alkanolamines
[PB93-176188] p 3471 N93-29676

A preliminary review of global CO2 exchange between ocean and atmosphere
[AD-A264019] p 3472 N93-30015

Fiber optic chemical sensors for characterizing the carbon cycle in ocean margin regions
[DE93-011442] p 3489 N93-30056

Hydrogen sulfide decomposition into hydrogen and sulfur by quinone cycles, part 1
[PB93-175297] p 3317 N93-30761

CARBON DIOXIDE CONCENTRATION

Predicting the response of a temperate forest ecosystem to atmospheric CO2 increase
[DE93-010081] p 3467 N93-28543

CARBON DIOXIDE LASERS

Construction and operation of a gas transport CO2 laser
[AD-A263102] p 3438 N93-29797

CARBON DIOXIDE REMOVAL

Global warming issue and global economic model
[DE93-781334] p 3468 N93-28881

Study on technology for effective utilization of carbon dioxide in view of global environment
[DE93-781440] p 3468 N93-28883

CARBON DISULFIDE

Examination of shock induced chemical reactions in liquids using time-resolved optical spectroscopy
p 3318 N93-30073

Gas electron diffraction employing a pulsed electron beam synchronous with photoexcitation
p 3319 N93-30101

CARBON FIBER REINFORCED PLASTICS

Ultrasonic detection and identification of fabrication defects in composites p 3305 N93-30856

CARBON FIBERS

Apparatus for intercalating large quantities of fibrous structures
[NASA-CASE-LEW-15077-2] p 3298 N93-29609

Powder towpreg process development
p 3303 N93-30844

Studies of fiber-matrix adhesion on compression strength p 3304 N93-30846

The initiation, propagation, and effect of matrix microcracks in cross-ply and related laminates
p 3304 N93-30847

Characterization of multiaxial warp knit composites
p 3304 N93-30851

CARBON MONOXIDE

Generation of carbon monoxide in compartment fires
[PB93-146702] p 3244 N93-29211

Vibrational spectroscopy of shock-compressed fluids
p 3318 N93-30072

Submillimeter CO observations of warm gas around T-Tauri stars
[MPE-PREPRINT-232] p 3631 N93-30615

CO lines toward NGC 2024 and other star forming regions: A closer look at the warm gas component
[MPE-PREPRINT-223] p 3637 N93-30639

Carbon monoxide exposure of subjects with documented cardiac arrhythmias
[PB93-179943] p 3497 N93-30890

CARBON STEELS

Interim fatigue design curves for carbon, low-alloy, and austenitic stainless steels in LWR environments
[DE93-009202] p 3323 N93-29102

CARBON 13
1,2-Dimethyl-1,2-Disila-Closo-Dodecaborane(12), A silicon analog of an ortho-carborane: Synthesis; x ray crystal structure; NMR, vibrational and photoelectron spectra; bonding
[AD-A264709] p 3599 N93-30568

CARBONACEOUS CHONDRITES
Further analysis of LDEF FRECOPA micrometeoroid remnants p 3638 N93-29360

CARBOXYHEMOGLOBIN
Carbon monoxide exposure of subjects with documented cardiac arrhythmias
[PB93-179943] p 3497 N93-30890

CARBOXYLATION
A novel process for methanol synthesis
[DE93-013070] p 3314 N93-30188

CARCINOGENS
Gene transcription and electromagnetic fields
[DE93-010854] p 3490 N93-28848

CARDIOVASCULAR SYSTEM
The physiological limitations of man in the high G environment p 3503 N93-28861

CARGO AIRCRAFT
The development of a parachute system for aerial delivery from high speed cargo aircraft
[DE93-008339] p 3239 N93-29035

CARGO SPACECRAFT
Solar electric propulsion cargo spacecraft for Mars missions p 3235 N93-29758

CARRIER FREQUENCIES
Acoustic transducer system
[AD-D015713] p 3562 N93-29279

CARRIER MOBILITY
Femtosecond carrier processes in compound semiconductors and real time signal processing
[AD-A262966] p 3384 N93-29514

CARRIER WAVES
Signal-to-noise ratio losses in full spectrum combining of signals with a downconverted subcarrier
p 3386 N93-29599

CARTAN SPACE
Connections between quantized affine algebras and superalgebras
[DE93-606065] p 3551 N93-30810

CASCADE FLOW
Three-dimensional fiber-optic LDV measurements in the endwall region of a linear cascade of controlled-diffusion stator blades
[AD-A263513] p 3424 N93-29968

CASE HISTORIES
A fuzzy case based reasoning tool for model based approach to rocket engine health monitoring
p 3289 N93-29570
Technology transfer in the NASA Ames Advanced Life Support Division p 3628 N93-30724

CASSEGRAIN ANTENNAS
A note on the computation of antenna-blocking shadows p 3385 N93-29593
A dual polarized broadband multifrequency Earth station feed p 3371 N93-30319

CASSEGRAIN OPTICS
Optical system analysis for the ground based EXVM
[NASA-CR-192588] p 3582 N93-31035

CASTING
Infiltration/cure modeling of resin transfer molded composite materials using advanced fiber architectures
p 3303 N93-30843
Development of stitching reinforcement for transport wing panels p 3304 N93-30852
Development of resins for composites by resin transfer molding p 3305 N93-30853
Mechanical and analytical screening of braided composites for transport fuselage applications
p 3305 N93-30855

CASTINGS
Development of a CFD code for casting simulation
[NASA-CR-192577] p 3427 N93-30492
Durability of Quick Reaction Satellite Antenna (QRSA) trunnion castings
[AD-A264095] p 3281 N93-30813

CATACLYSMIC VARIABLES
IUE observations of cataclysmic variable
[NASA-CR-193188] p 3629 N93-28634

CATALOGS (PUBLICATIONS)
The NASA SBIR product catalog
[NASA-TM-108242] p 3609 N93-29322
Origin of orbital debris impacts on LDEF's trailing surfaces p 3283 N93-29373
Air weather service master station catalog USAFETAC climatic database users handbook no. 6
[AD-A264761] p 3484 N93-30608
Standard and reference materials for marine science, third edition
[PB93-185684] p 3489 N93-30830

CATALYSIS
Catalytic synthesis of silicon carbide preceramic polymers: Polycarbosilanes
[DE93-008634] p 3329 N93-28541
Supported organometallic complexes, surface chemistry, spectroscopy, and catalysis
[DE93-011930] p 3309 N93-28688
Kinetics and dynamics of reacting systems
[AD-A264046] p 3313 N93-30030
Organometallic and surface chemistry of mixed-metal systems
[DE93-012686] p 3325 N93-30059
Decomposition of hydrogen sulfide for small scale gas processing.
[PB93-174704] p 3316 N93-30658
Gordon Research Conferences, 1991
[AD-A264275] p 3317 N93-30816

CATALYSTS
Catalytic synthesis of silicon carbide preceramic polymers: Polycarbosilanes
[DE93-008634] p 3329 N93-28541
Design of a high activity and selectivity alcohol catalyst
[DE93-012277] p 3309 N93-28750
High octane ethers from synthesis gas-derived alcohols
[DE93-012470] p 3341 N93-28752
Applications of transition metal compounds in the preparation of useful silicon-containing ceramics
[AD-A264028] p 3335 N93-30028
Synthesis of chiral molybdenum ROMP initiators and all-cis highly tactic Poly-2,3-R2Norbornadiene (R = CF3 or CO2Me)
[AD-A264133] p 3336 N93-30169
A novel process for methanol synthesis
[DE93-013070] p 3314 N93-30188
Magnetic character investigation of higher alcohol synthesis Cu-Co-Cr catalysts
[DE93-009732] p 3316 N93-30653
Conjugated polymers from cyclohexadienediol monomers
[AD-A264837] p 3340 N93-30900

CATALYTIC ACTIVITY
Supported organometallic complexes, surface chemistry, spectroscopy, and catalysis
[DE93-011930] p 3309 N93-28688
Hydrogen sulfide decomposition into hydrogen and sulfur by quinone cycles, part 1
[PB93-175297] p 3317 N93-30761

CATHODE RAY TUBES
Low-cost helmet-mounted displays
[AD-A262616] p 3501 N93-28479

CATHODES
Field-emitter arrays for RF vacuum microelectronics
[AD-A262677] p 3404 N93-28483
Alkali metal carbon dioxide electrochemical system for energy storage and/or conversion of carbon dioxide to oxygen
[NASA-CASE-LEW-14973-1] p 3464 N93-28974

CATIONS
Synthesis and properties of a cation-conducting, high temperature polymer electrolyte
[AD-A263557] p 3334 N93-29825

CAUCHY PROBLEM
A Riemann problem for an elastic bar that changes phase
[AD-A262827] p 3452 N93-29432
Quantum field theory in spaces with closed time-like curves
[DE93-010564] p 3605 N93-30481

CAVITIES
Aerothermic calculations of flows in interdisc cavities of turbines p 3256 N93-29947
Study of flow structure in rotating cavities: Numerical predictions of laminar and turbulent, steady, and unsteady flows p 3256 N93-29948
Development of a CFD code for casting simulation
[NASA-CR-192577] p 3427 N93-30492

CAVITY RESONATORS
High-efficiency high-reliability optical components for a large, high-average-power visible laser system
[DE93-009225] p 3437 N93-29098
Study of gain in C-band deflection cavities for a frequency-doubling magnicon amplifier
[AD-A263132] p 3409 N93-29478
Experimental test of hole-coupled FEL resonator designs using a CW-HeNe laser
[DE93-010439] p 3440 N93-30530
Phase transition studies in barium and strontium titanates at microwave frequencies p 3293 N93-30970

CELL ANODES
Research and development of carbon black anodes for lithium secondary cells
[DE93-781331] p 3406 N93-28746
Materials characterization of cermet anodes tested in a pilot cell
[DE93-008924] p 3323 N93-29101

CELL MEMBRANES (BIOLOGY)
Micropipet manipulation of lipid membranes: Direct measurement of the material properties of a cohesive structure that is only two molecules thick
p 3291 N93-30953

CELLS (BIOLOGY)
Comparative mutagenesis of human cells in vivo and in vitro
[DE93-012269] p 3490 N93-28651
Biophysical and biochemical mechanisms in synaptic transmitter release
[AD-A264829] p 3496 N93-30613
The Gordon Research Conference on Pineal Cell Biology
[AD-A264840] p 3497 N93-30904

CENTER OF GRAVITY
Vehicle dynamic stability and rollover
[PB93-185437] p 3447 N93-30828

CENTRAL NERVOUS SYSTEM
Hydrogen-rated system for in vitro studies at pressure: Operating procedures and emergency procedures
[AD-A264179] p 3497 N93-30882

CENTRAL PROCESSING UNITS
Development of a PC code package for the analysis of research and power reactors
[DE92-638517] p 3536 N93-31001

CENTRIFUGAL FORCE
Combined centrifugal force/gravity gas/liquid separator system
[AD-D015726] p 3444 N93-29288

CENTRIFUGES
Testing in combined dynamic environments
[DE93-010679] p 3278 N93-29250
Combined centrifugal force/gravity gas/liquid separator system
[AD-D015726] p 3444 N93-29288
Acquisition of physiological data during G-induced Loss of Consciousness (G-LOC)
[AD-A264492] p 3496 N93-30400

CENTRIPETAL FORCE
Three-dimensional numerical simulation of gradual opening in a wave rotor passage
[NASA-CR-191157] p 3252 N93-29072

CEPSTRAL ANALYSIS
Examinations of perturbation reduction by automatic speech dependent recognition of separately spoken single words
[ETN-93-94180] p 3394 N93-30672

CERAMIC COATINGS
Laser gas alloying of titanium materials
[ETN-93-93805] p 3325 N93-30115
Development of adherent ceramic coatings to reduce contact stress damage of ceramics
[DE93-012518] p 3336 N93-30182
Colloid and interface chemistry aspects of ceramics
[AD-A264685] p 3337 N93-30552

CERAMIC FIBERS
Interfacial studies of refractory glass-ceramic matrix/advanced SiC fiber reinforced composites
[AD-A263264] p 3299 N93-29802
The effect of oxidation embrittlement on the impact behavior of nicalon reinforced CAS 2 ceramic matrix composites
[AD-A263567] p 3334 N93-29829

CERAMIC HONEYCOMBS
Theoretical and experimental study of thermoacoustic engines
[AD-A261934] p 3561 N93-28995

CERAMIC MATRIX COMPOSITES
Mechanics of elevated temperature fatigue damage in fiber-reinforced ceramics
[AD-A262403] p 3329 N93-28495
Ultrahigh temperature assessment study: Ceramic matrix composites
[AD-A262740] p 3295 N93-28592
Ceramic matrix composites properties/microstresses with complete and partial interphase bond
[NASA-TM-106136] p 3297 N93-29071
Acousto-Ultrasonic analysis of failure in ceramic matrix composite tensile specimens
[NASA-TM-106219] p 3449 N93-29073
Technology transfer personnel exchange at the Boeing Company
[DE93-010190] p 3625 N93-29329
Interfacial studies of refractory glass-ceramic matrix/advanced SiC fiber reinforced composites
[AD-A263264] p 3299 N93-29802
The effect of oxidation embrittlement on the impact behavior of nicalon reinforced CAS 2 ceramic matrix composites
[AD-A263567] p 3334 N93-29829
Whisker toughening of ceramic materials: A review
[DE93-011565] p 3336 N93-30129

Characterization of ceramic composite materials for gas turbine applications
[DE93-009719] p 3259 N93-30168
Wetting and dispersion in ceramic/polymer melt injection molding systems
[DE93-013240] p 3338 N93-30601
Design, synthesis, and chemical processing of hierarchical ceramic structures for aerospace applications
[AD-A264227] p 3339 N93-30885
Damage of multi-directionally reinforced ceramic-matrix composites p 3308 N93-30937

CERAMICS
Refractory metal disilicides research
[AD-A262416] p 3320 N93-28499
Catalytic synthesis of silicon carbide preceramic polymers: Polycarbosilanes
[DE93-008634] p 3329 N93-28541
Ultrahigh temperature assessment study: Ceramic matrix composites
[AD-A262740] p 3295 N93-28592
Soft computing in design and manufacturing of advanced materials
[NASA-TM-106032] p 3295 N93-28624
A study of the chemical mechanism in lubrication
[DE93-012230] p 3330 N93-28650
Effect of metallic-coating properties on the tribology of coated and oil-lubricated ceramics
[DE93-010663] p 3330 N93-28666
Healing of lithographically introduced flaws in glass and glass containing ceramics
[DE93-010453] p 3330 N93-28761
Use of local x ray computerized tomography for high-resolution, region-of-interest inspection of large ceramic components for engines
[DE93-005564] p 3449 N93-28943
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-008] p 3322 N93-29012
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-007] p 3322 N93-29013
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-009] p 3322 N93-29015
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-012] p 3296 N93-29016
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-016] p 3296 N93-29018
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-015] p 3322 N93-29020
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-93-001] p 3296 N93-29021
Operational results of pilot cell test with cermet inert anodes
[DE93-009338] p 3322 N93-29061
Oxidation behavior in reaction-bonded aluminum-silicon alloy/alumina powder compacts
[DE93-010407] p 3298 N93-29191
A transient FGM interlayer based approach to joining ceramics
[DE93-010415] p 3331 N93-29248
Microwave processing of ceramics
[DE93-010708] p 3332 N93-29252
The design and lifetime calculation of MHD generator walls based on subcritical crack growth in ceramics
[ISBN-90-9004009-9] p 3332 N93-29267
Technology transfer personnel exchange at the Boeing Company
[DE93-010190] p 3625 N93-29329
Proceedings of the 25th European Conference on the Application of Polar Dielectrics to celebrate the 25th anniversary of the Dielectric Society, incorporating the 1st International Workshop on Integrated Ferroelectrics
[AD-A263427] p 3332 N93-29337
Boron carbide aluminum cermets for external pressure housing applications
[AD-A262749] p 3333 N93-29404
Crystallization of nanocomposite glasses made by the SSG process
[AD-A262892] p 3333 N93-29511
Properties of superconducting YBa2Cu3O(6+4) ceramic materials: Effect of processing parameters
[AD-A263441] p 3334 N93-29790
Balanced technology initiative on computational mechanics of materials
[AD-A263906] p 3453 N93-29863
Applications of transition metal compounds in the preparation of useful silicon-containing ceramics
[AD-A264028] p 3335 N93-30028
The drive to cost-effective structural ceramics
[DE93-009722] p 3335 N93-30047
Materials for adaptive structural acoustic control, volume 1
[AD-A264619] p 3562 N93-30121
Characterization of ceramic composite materials for gas turbine applications
[DE93-009719] p 3259 N93-30168
Methylhydridopolysilazane and its pyrolytic conversion to Si3N4/SiC ceramics
[AD-A264150] p 3336 N93-30170
Development of adherent ceramic coatings to reduce contact stress damage of ceramics
[DE93-012518] p 3336 N93-30182
Materials for adaptive structural acoustic control, volume 2
[AD-A264620] p 3563 N93-30385
A ceramic fracture model for high velocity impact
[AD-A264728] p 3454 N93-30545
Colloid and interface chemistry aspects of ceramics
[AD-A264685] p 3337 N93-30552
Mold bolt and means for achieving close tolerances between bolts and bolt holes
[NASA-CASE-MFS-28720-1] p 3447 N93-30567
Elastic stability considerations for deep submergence ceramic pressure housing
[AD-A264824] p 3454 N93-30598
Adhesion of thick film Au to alumina ceramics
[DE93-009802] p 3339 N93-30656
Decomposition of hydrogen sulfide for small scale gas processing.
[PB93-174704] p 3316 N93-30658
Effect of lead addition on the formation of superconducting phases in Bi-Sr-Ca-Cu-O ceramics
[DE93-606893] p 3339 N93-30773
The effect of Bi2 O3 on the electrical properties of Zr O2: 3 percent Mg O ceramic solid electrolytes
[DE93-607029] p 3339 N93-30774
Guideway structural design and power/propulsion/braking in relation to guideways, volume 1
[PB93-169902] p 3447 N93-30820
Processing of novel nanoparticle dispersion strengthened ceramics for improved mechanical performance
[AD-A264191] p 3339 N93-30883
Design, synthesis, and chemical processing of hierarchical ceramic structures for aerospace applications
[AD-A264227] p 3339 N93-30885
New materials: Fountainhead for new technologies and new science p 3291 N93-30952
Temperature-dependent electrical conductivity of soda-lime glass p 3294 N93-30978

CEREBRAL CORTEX
Principal components of natural images: An analytical solution
[AD-A264800] p 3489 N93-30603

CERMETS
Operational results of pilot cell test with cermet inert anodes
[DE93-009338] p 3322 N93-29061
Materials characterization of cermet anodes tested in a pilot cell
[DE93-008924] p 3323 N93-29101
Boron carbide aluminum cermets for external pressure housing applications
[AD-A262749] p 3333 N93-29404

CERTIFICATION
Building a generalized distributed system model
[NASA-CR-193239] p 3527 N93-29219
Guide for certifying pressure vessels and systems
[NASA-TM-107549] p 3449 N93-29220
Report on the test set-up for the structural testing of the Airmass Sunburst Ultralight Aircraft
p 3249 N93-29775
Helicopter simulator standards p 3236 N93-30675
Helicopter simulation: An aircrew training and qualification perspective p 3236 N93-30676

CESIUM IONS
NPB cesium space experiment p 3267 N93-28733
Measurement of work function of a plasma grid in a cesium seeded negative ion source
[DE93-764153] p 3589 N93-30190

CHALCOGENIDES
Electrochemical fabrication of cadmium chalcogenide microdiode arrays
[AD-A263169] p 3310 N93-28988

CHANNEL CAPACITY
A slotted Aloha satellite channel simulator
p 3360 N93-30250

CHANNEL FLOW
Analysis of unsteady wave processes in a rotating channel
[NASA-CR-191154] p 3251 N93-28617
A new flux conserving Newton's method scheme for the two-dimensional, steady Navier-Stokes equations
[NASA-TM-106160] p 3416 N93-28626
An efficient spectral integration method for the solution of the Navier-Stokes equations
[FFA-TN-1992-28] p 3418 N93-29009

CHANNELS (DATA TRANSMISSION)
A comparison of high-speed links, their commercial support and ongoing R/D activities
[DE93-008134] p 3382 N93-29245
T(lc2)acS(lc3)ats for Surveillance Verification and C3I
[AGARD-CP-522] p 3387 N93-29892
Tactical satellites p 3284 N93-29893
TACSAT-spacecraft bus concept and design: Application of a multimission bus for TACSAT in LEO
p 3284 N93-29896
Propagation channel modeling for angle-diversity combining simulation p 3360 N93-30252
Characteristics of high-frequency signals, noise, availability, and duration of bandwidths based on ROTHR Amchitka spectrum measurements
[AD-A264480] p 3393 N93-30423
Optically powered, optoelectronic spatial light modulators
[AD-A264765] p 3581 N93-30609

CHAOS
Self-consistent chaos in the beam-plasma instability
[DE93-009581] p 3584 N93-28599
Dynamical analysis of highly excited molecular spectra
[DE93-010771] p 3564 N93-28604
Bifurcations phenomena in a nonlinear oscillator: Approximate analytical studies versus computer simulation results p 3407 N93-29037
Chaos in mechanical systems with especial reference to rotorcraft and missiles
[AD-A263703] p 3604 N93-29384
Estimating the parameters of chaotic maps
[AD-A262574] p 3556 N93-29423
Non-scalar uncertainty: Uncertainty in dynamic systems p 3517 N93-29565
Study of effects of small perturbations on chaotic systems
[DE93-009762] p 3557 N93-30048
Chaotic quantum systems
[DE93-606030] p 3606 N93-30802
Scaling properties of localized quantum chaos
[DE93-606031] p 3606 N93-30803
General scalar-tensor theories for induced gravity inflation
[DE93-602505] p 3479 N93-30940

CHARACTER RECOGNITION
Character recognition using a neural network model with fuzzy representation p 3512 N93-29536
Comparison of crisp and fuzzy character networks in handwritten word recognition p 3514 N93-29545

CHARACTERIZATION
Growth, characterization and device development in monocrystalline diamond films
[AD-A263204] p 3593 N93-28874
Tank issues: Site characterization for external leak monitoring
[PB93-161156] p 3469 N93-29034
Characterization and optimization of a Hot Air Solder-Leveling System
[DE93-010188] p 3332 N93-29328
Applications of laser light scattering in polymer dilute solution characterization
[AD-A263110] p 3335 N93-30007
Electro-optic characterisation of extremely wide bandwidth electrical signals
[AD-A264202] p 3392 N93-30145
Measurements and Characterization Branch
[DE93-000094] p 3465 N93-30207
Application of non-standard signal processing to ELF noise characterization for the TSS1-OESEE programme
p 3397 N93-30743

CHARGE CARRIERS
New III-V cell design approaches for very high efficiency
[DE93-000097] p 3464 N93-28971
Ultrafast optical studies of surface reaction processes at semiconductor interfaces
[DE93-009049] p 3593 N93-29096
Charge separation in bipolar transistors
[DE93-009624] p 3413 N93-30650

CHARGE COUPLED DEVICES
High-performance visible/UV CCD focal plane technology for spacebased applications
p 3434 N93-28771
Honeywell's compact, wide-angle UV-visible imaging sensor p 3582 N93-28806
A compact imaging detector of polarization and spectral content p 3582 N93-28810
Operating manual for single-shot autocorrelator
[AD-A262016] p 3438 N93-29395
A new tubeless nanosecond streak camera based on optical deflection and direct CCD imaging
[DE93-011893] p 3433 N93-30491

Advanced research in sky surveillance: A search for low-luminosity objects
[AD-A264832] p 3631 N93-30629
CAESAR development plan 1992-1995
[BCRS-92-17] p 3463 N93-31009

CHARGE DISTRIBUTION
Antenna modeling and analysis for ELF/VLF/LF applications p 3398 N93-30751

CHARGE EXCHANGE
Coupled-channel analysis of low energy nucleon-antinucleon interactions
[DE93-606115] p 3571 N93-30791

CHARGE TRANSFER
High-performance visible/UV CCD focal plane technology for spacebased applications
p 3434 N93-28771
Analytical applications of electrified interfaces between two immiscible solutions
[AD-A263085] p 3311 N93-29132
Elastic and reactive collisions of atoms and molecules with neutral alkali clusters
[DE93-009313] p 3566 N93-29206
Effects of neutral gas collisions on the power transmission factor at the divertor sheath
[DE93-009320] p 3588 N93-29334
Experimental and theoretical aspects of excited state electron transfer and related phenomena
[AD-A263457] p 3570 N93-30589
Optimization for steady-state and hybrid operations of ITER by using scaling models of divertor heat load
[DE93-764151] p 3590 N93-30649
Charge separation in bipolar transistors
[DE93-009624] p 3413 N93-30650
Effective interactions between concentration fluctuations and charge transfer in chemically ordering liquid alloys
[DE93-606724] p 3327 N93-30778
Coupled-channel analysis of low energy nucleon-antinucleon interactions
[DE93-606115] p 3571 N93-30791

CHARGE TRANSFER DEVICES
Analyses of data from fine structure and circulation studies in the Gulf of California
[AD-A262910] p 3486 N93-28885

CHARGED PARTICLES
Transfer Orbit Plasma Interaction Experiment (TROPIX) p 3267 N93-28734
Nonlinear dynamics and plasma transport
[DE93-012238] p 3585 N93-28749
Ion motion effects on charged radiators
[DE93-009257] p 3565 N93-29099
Molecular dynamics modeling of electric double layers with spectroscopic applications
[AD-A263168] p 3568 N93-29489
Charged particle activation studies on the surface of LDEF spacecraft p 3572 N93-29630
LET spectra measurements of charged particles in the P0006 experiment on LDEF p 3573 N93-29637
Three-dimensional shielding effects on charged particle fluences measured in the P0006 experiment of LDEF
p 3573 N93-29639
Electron transport calculations between 1 MeV and 1 eV
[AD-A263412] p 3568 N93-29787
Design of acentric materials: X ray structures of guanidinium p-nitro- and p-hydroxybenzenesulfonate
[AD-A264220] p 3597 N93-30146

CHARM (PARTICLE PHYSICS)
Study of heavy-flavored particles
[DE93-011535] p 3569 N93-30128

CHARON
Visible imaging on the Pluto fast flyby mission
p 3646 N93-28799

CHARPY IMPACT TEST
An automated data collection system for a Charpy impact tester p 3293 N93-30972

CHEBYSHEV APPROXIMATION
A spectral method determination of the first critical Rayleigh number for a low-Prandtl number crystal melt in a cylindrical container
[NASA-CR-193238] p 3594 N93-29214

CHECKOUT
Nonresident and endangered variables: The effects of code generation optimizations on symbolic debugging
[AD-A263149] p 3529 N93-29486

CHELATES
Synthetic lubricating oil greases containing metal chelates of Schiff bases
[AD-D015694] p 3333 N93-29458
Rates and mechanisms of reaction of hydrogen sulfide with iron chelates
[PB93-184299] p 3312 N93-29665

CHEMICAL ANALYSIS
Evaluation of polyaryl adhesives in elastomer-stainless steel joints
[DE93-009794] p 3329 N93-28551
Laer-induced breakdown spectroscopy instrument for element analysis of planetary surfaces
p 3434 N93-28769
Further analysis of LDEF FRECOPA micrometeoroid remnants p 3638 N93-29360
SIMS chemical analysis of extended impacts on the leading and trailing edges of LDEF experiment AO187-2
p 3318 N93-29367
Transcutaneous analyte measuring methods
[AD-A262861] p 3494 N93-29509
Thermal cycler temperature variation and its effect on the polymerase chain reaction
[AD-A264660] p 3337 N93-30541
Hydrogeology and ground-water-quality conditions at the Reno County Landfill, South-Central Kansas, 1990-1991
[PB93-183085] p 3474 N93-30826

CHEMICAL BONDS
Adsorption of sulfate on metal electrodes
[AD-A263192] p 3309 N93-28540
What is underneath? Moving atoms and molecules to find out
[AD-A263363] p 3567 N93-29332
Synthesis of oligoimides and oligoimide anion radicals
[AD-A263129] p 3290 N93-29474
Molecular dynamics of detonation in crystals with defects p 3350 N93-30097
Applications of density functional theory to calculation of reaction energetics p 3351 N93-30098
Conjugated substituted ionic polyacetylenes
[AD-A264702] p 3337 N93-30497
Surface chemistry of N2H4 on Si(100)-2x1
[AD-A264819] p 3316 N93-30627
Defining protein electrostatic recognition processes
[AD-A264838] p 3571 N93-30901

CHEMICAL COMPOSITION
Laer-induced breakdown spectroscopy instrument for element analysis of planetary surfaces
p 3434 N93-28769
Planetary and satellite x ray spectroscopy: A new window on solid-body composition by remote sensing
p 3641 N93-28773
A remote laser-mass spectrometer for determination of elemental composition p 3434 N93-28775
The APX spectrometer for Martian missions
p 3434 N93-28776
Bainitic stabilization of austenite in low alloy steels
[DE93-008275] p 3321 N93-28957
Materials characterization of cermet anodes tested in a pilot cell
[DE93-008924] p 3323 N93-29101
Novel polymer compositions for high-temperature membrane applications, phase 1
[PB93-174126] p 3331 N93-29201
Real time self-directed MBE flux control incorporation in situ ellipsometry, phase 1
[AD-A263501] p 3595 N93-29341
SIMS chemical analysis of extended impacts on the leading and trailing edges of LDEF experiment AO187-2
p 3318 N93-29367
Geochemical and fluid dynamic investigations into the nature of chemical heterogeneity in the Earth's mantle
[AD-A262753] p 3477 N93-29405
Elemental compositions of high-energy ions produced by magnetosonic waves in quiescent plasmas
[DE93-753241] p 3588 N93-29434
Progress report on the Heavy Ions in Space (HIIS) experiment p 3573 N93-29645
Multiwavelength studies of classical nova shells
p 3636 N93-30412
Colloid and interface chemistry aspects of ceramics
[AD-A264685] p 3337 N93-30552
Study on diamond semiconductor
[DE92-531076] p 3413 N93-30622
Standard and reference materials for marine science, third edition
[PB93-185684] p 3489 N93-30830
Physical chemical studies on molecular composite compositions
[AD-A264834] p 3339 N93-30898

CHEMICAL ENERGY
Kinetics and energy transfer in nonequilibrium fluid flows
[AD-A263612] p 3240 N93-29284
Molecular dynamics of detonation in crystals with defects p 3350 N93-30097

CHEMICAL ENGINEERING
The use of quantum chemistry to estimate the performance and properties of explosives
[DE92-040369] p 3352 N93-30446

CHEMICAL EQUILIBRIUM
Synthesis of new high performance lubricants and solid lubricants
[DE93-012237] p 3330 N93-28748
Direct Monte Carlo simulation of the chemical equilibrium composition of detonation products
[DE92-040372] p 3315 N93-30447

CHEMICAL EXPLOSIONS
A simple model for explosives formulation
[DE93-010703] p 3341 N93-29251
Weakly nonlinear dynamics of near-CJ detonation waves
[DE93-007344] p 3424 N93-29836
Strategies for understanding the deflagration-to-detonation transition
p 3319 N93-30077
Pressure dependence of the reaction propagation rate of TATB to 40 GPa p 3319 N93-30082
Detonation shock dynamics of composite energetic materials p 3350 N93-30096
The use of quantum chemistry to estimate the performance and properties of explosives
[DE92-040369] p 3352 N93-30446
Direct Monte Carlo simulation of the chemical equilibrium composition of detonation products
[DE92-040372] p 3315 N93-30447
The calculation of electrostatic interactions and their role in determining the energies and geometries of molecular HE crystals
[DE92-040374] p 3570 N93-30448

CHEMICAL PROPERTIES
Structure, adhesion, and stability of metal/oxide and oxide/oxide interfaces
[DE93-012930] p 3325 N93-30060
Use of statistics in computational chemistry
[AD-A264307] p 3315 N93-30365

CHEMICAL REACTIONS
A study of the chemical mechanism in lubrication
[DE93-012230] p 3330 N93-28650
The onset of vortex turbulence
[DE93-010424] p 3417 N93-28663
Effect of metallic-coating properties on the tribology of coated and oil-lubricated ceramics
[DE93-010663] p 3330 N93-28666
Additional support for the TDK/MABL computer program
[NASA-CR-193037] p 3526 N93-29028
Report on the sintering and properties of MgO and MgO-5 percent TiC
[DE93-008676] p 3323 N93-29092
Tailored interfaces for metal-matrix composites-fundamental considerations
[AD-A263048] p 3298 N93-29130
A simple model for explosives formulation
[DE93-010703] p 3341 N93-29251
Weakly nonlinear dynamics of near-CJ detonation waves
[DE93-007344] p 3424 N93-29836
ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials
[CPIA-PUBL-589] p 3343 N93-30061
The thermochemistry and reaction pathways of the decomposition and combustion of energetic materials
p 3343 N93-30063
Examination of shock induced chemical reactions in liquids using time-resolved optical spectroscopy
p 3318 N93-30073
Single-shot femtosecond spectroscopy: A methodology for observation of solid-state chemical reactions
p 3319 N93-30075
Determination of gas phase species and temperature profiles above solid propellants p 3346 N93-30080
Metallization at detonation fronts in solids
p 3319 N93-30087
Microstructural basis for enhanced shock-induced chemistry in single crystals of ammonium perchlorate
p 3319 N93-30092
Rate constant determinations of reactions H + HNO from ab initio reaction path calculations
p 3319 N93-30099
Atomic layer epitaxy of semiconductor heterostructures
[AD-A264755] p 3599 N93-30560
Hydrogen sulfide decomposition into hydrogen and sulfur by quinone cycles, part 1
[PB93-175297] p 3317 N93-30761

CHEMICAL REACTORS
A novel process for methanol synthesis
[DE93-013070] p 3314 N93-30188

CHEMICAL RELEASE MODULES
FNAS CRRES program completion
[NASA-CR-192468] p 3476 N93-29032

CHEMISORPTION
FI-STM investigation of atomic hydrogen adsorption on the Si(100)2x1 surface
[AD-A262748] p 3567 N93-29403
Complex-compound heat pump: Topical report on phase 1 results
[PB93-185460] p 3466 N93-30814

CHEMISTRY
DOE fundamentals handbook: Chemistry
[DE93-012222] p 3314 N93-30198

CHINA
International aviation (Selected articles)
[AD-A262566] p 3227 N93-28576

CHIPS (ELECTRONICS)
Thermal and mechanical analysis of flip-chips on a liquid cooled multichip module
[DE93-007609] p 3405 N93-28641
Efficient wiring of reconfigurable parallel processors
[DE93-009847] p 3538 N93-29186
Department of defense advisory group on electron devices: Appendix to special technology area review on microwave packaging technology
[AD-A262136] p 3408 N93-29408
Multichip module high speed testing
[AD-A262989] p 3408 N93-29427
An MCM/chip concurrent engineering validation
[AD-A262959] p 3409 N93-29513
Design of a pixel cell optimized for a data push architecture readout
[DE93-011016] p 3616 N93-30122
A single chip high-speed CMOS Viterbi decoder
p 3358 N93-30238
Placement of cells: Theory and solution of a quadratic 0/1 optimization problem
[ETN-93-94182] p 3413 N93-30616

CHIPS (MEMORY DEVICES)
Spacecraft computer technology at Southwest Research Institute p 3522 N93-28813

CHIRAL DYNAMICS
On the photonic chiral anomaly in an external gravitational field
[DE93-606082] p 3479 N93-30785
Compensating fields and anomalies in supergravity
[DE92-644724] p 3637 N93-30919

CHLORINE
Studies in Lewis acid and superacid ionic liquids
[AD-A264683] p 3316 N93-30551

CHLOROFLUOROCARBONS
Potential effects of HFC-152a on global ozone and climate
[DE93-008018] p 3471 N93-29792

CHLOROPHYLLS
Remote sensing for water quality monitoring in the Tennessee Valley: Field tests of two systems
[DE93-008997] p 3462 N93-30637

CHOKED FLOW
Preliminary experimental results for a cryogenic brush seal configuration
[NASA-TM-106236] p 3416 N93-28627

CHOLESKY FACTORIZATION
Exploiting the memory hierarchy in sequential and parallel sparse Cholesky factorization
[AD-A262849] p 3539 N93-29508

CHOLINERGICS
Neural mechanisms of attention
[AD-A264345] p 3544 N93-30165

CHROMATOGRAPHY
Chromatographic and solvatochromic measurements on butyl rubbers
[AD-A263088] p 3334 N93-29795

CHROMIUM
The electrodeposition of low contraction chromium using high/low current pulsing
[AD-A264475] p 3327 N93-30538
Magnetic character investigation of higher alcohol synthesis Cu-Co-Cr catalysts
[DE93-009732] p 3316 N93-30653

CHROMIUM ALLOYS
High temperature creep and oxidation resistant chromium silicide matrix alloy containing molybdenum
[NASA-CASE-LEW-15697-1] p 3323 N93-29172
Effects of internal helium on mechanical properties of Nitronic (tm) 40 stainless steel
[DE93-009902] p 3324 N93-29265
Examination of formability to seamless tubes on Ni-Cr-W superalloy
[DE93-764158] p 3326 N93-30396
Development of Ni-Cr-W superalloys for high temperature components in high temperature gas-cooled reactors, part 2
[DE93-764469] p 3326 N93-30399

CHROMIUM STEELS
Preliminary test of liquid metal induced embrittlement in liquid LiPb and stainless-steel systems
[DE93-753130] p 3320 N93-28529

CIRCADIAN RHYTHMS
Control and circadian behavior by transplanted suprachiasmatic nuclei
[AD-A264553] p 3496 N93-30382
Molecular approach to hypothalamic rhythms
[AD-A264438] p 3496 N93-30421
Photoreceptors regulating circadian behavior: A mouse model
[AD-A264881] p 3497 N93-30908

CIRCUIT BOARDS
Prototype and short-run printed circuit board creation
[AD-A263245] p 3409 N93-29655
Detecting residue on a printed circuit board: An application of the Boundary Contour/Feature Contour System
[DE93-006283] p 3412 N93-30370

CIRCUIT PROTECTION
Characteristic and development report SA3581/MC4196 Lightning Arrestor Connector (LAC)
[DE93-010610] p 3412 N93-30118

CIRCUITS
Initial graphics exchange specification hybrid microcircuit application protocol
[PB93-175404] p 3407 N93-29203
An MCM/chip concurrent engineering validation
[AD-A262959] p 3409 N93-29513

CIRCULAR CYLINDERS
Direct numerical simulations of unsteady separated flows using vortex methods p 3419 N93-29077

CIRCULAR TUBES
The effect of orthogonal-mode rotation on forced convection in a circular-sectioned tube fitted with full circumferential transverse ribs p 3254 N93-29937

CIRCULATION CONTROL AIRFOILS
The numerical simulation of circulation controlled airfoil flowfields p 3243 N93-30947

CISLUNAR SPACE
Analysis of orbital system logistics in the cis-lunar space with particular consideration of life cycle costs
[ETN-93-93484] p 3268 N93-29063

CITIES
Summer 1990 Atlanta ozone precursor study (January 1993)
[PB93-167203] p 3470 N93-29200
Multi-Attribute Decision Theory methodology for pollution control measure analysis
[DE93-005444] p 3472 N93-30008

CIVIL AVIATION
Helicopter approach capability using the differential global positioning system
[NASA-CR-193183] p 3245 N93-28936
The 1991-1992 aviation system capacity plan
[AD-A263436] p 3261 N93-29788
Rotorcraft master plan p 3236 N93-30677
Sandia National Laboratories p 3626 N93-30702
The HSCT mission analysis of waverider designs
[NASA-CR-193467] p 3243 N93-31037

CLAMPS
Scanning electron microscope/energy dispersive x ray analysis of impact residues in LDEF tray clamps
p 3283 N93-29369
Spline screw autochanger
[NASA-CASE-GSC-13435-1] p 3445 N93-29505

CLASSICAL MECHANICS
A comparison of classical mechanics models and finite element simulation of elastically tailored wing boxes
p 3306 N93-30863

CLASSIFICATIONS
Image classification using Markov random fields with two new relaxation methods: Deterministic pseudo annealing and modified metropolis dynamics
[INRIA-RR-1606] p 3553 N93-28510
Preprocessing remotely-sensed data for efficient analysis and classification
[DE93-007367] p 3611 N93-28580
Classification theorem for principal fibre bundles, Berry's phase, and exact cycle evolution
[DE93-011114] p 3556 N93-28601
Security classification of information
[DE93-012416] p 3612 N93-28840
Evidence-based classification of satellite image data
p 3459 N93-28931
New classification methods p 3459 N93-28932
A fuzzy measure approach to motion frame analysis for scene detection p 3511 N93-29525
Feature based neural network acoustic transient signal classification
[AD-A263437] p 3562 N93-29816
A neural network based approach for machine fault diagnosis
[VTT-TIED-1274] p 3543 N93-29998
Computing with neural maps: Application to perceptual and cognitive function
[AD-A264056] p 3499 N93-30033

CLASSIFYING
Neural network cloud classification research
[AD-A264628] p 3484 N93-30176

CLEANING
Detecting residue on a printed circuit board: An application of the Boundary Contour/Feature Contour System
[DE93-006283] p 3412 N93-30370

CLEARANCES
An analysis of en route controller-pilot voice communications
[AD-A264784] p 3394 N93-30611

CLEAVAGE
The effect of temperature on the impact behavior of TiB2 reinforced XDTM-TiAl intermetallic matrix composites
[AD-A262924] p 3296 N93-28886

CLIMATE
Direct volume visualization of three-dimensional vector fields
[DE93-009233] p 3524 N93-28550
The Mechanisms of Solar Variability (MSV) program
[AD-A262525] p 3652 N93-28585
Atmospheric and Geophysical Sciences Division: G-Division did you know?
[DE93-007412] p 3469 N93-28967
Exploitation of parallelism in climate models
[DE93-011259] p 3470 N93-29318
The 17th Annual Climate Diagnostics Workshop
[PB93-183895] p 3483 N93-29664
Quantifying and minimizing uncertainty of climate forcing by anthropogenic aerosols
[NASA-TM-108259] p 3472 N93-30043

CLIMATE CHANGE
Development and testing of the Perseus proof-of-concept aircraft
[DE93-010121] p 3247 N93-28586
Modeling land-surface/atmosphere dynamics for CHAMMP
[DE93-008520] p 3476 N93-28677
Ocean Margins Program
[DE93-008937] p 3470 N93-29262
Stabilized platform for tethered balloon soundings of broadband long- and short-wave radiation
[DE93-007876] p 3383 N93-29308
Exploitation of parallelism in climate models
[DE93-011259] p 3470 N93-29318
Clouds and radiation: A primier
[AD-A263136] p 3482 N93-29479
Chemistry of the atmosphere: Its impact on global change. CHEMRAWN 7: Perspectives and recommendations
[PB93-180644] p 3488 N93-29670
Trend survey on the elucidation of the global warming mechanism by the governments of major industrialized nations
[DE93-776427] p 3470 N93-29672
Simulation of landscape disturbances and the effect of climatic change
[DE93-011615] p 3472 N93-30131

CLIMATOLOGY
Development and testing of the Perseus proof-of-concept aircraft
[DE93-010121] p 3247 N93-28586
Ocean Margins Program
[DE93-008937] p 3470 N93-29262
Exploitation of parallelism in climate models
[DE93-011259] p 3470 N93-29318
Clouds and radiation: A primier
[AD-A263136] p 3482 N93-29479
Advanced Earth Observing Satellite (ADEOS)
p 3279 N93-29648
The 17th Annual Climate Diagnostics Workshop
[PB93-183895] p 3483 N93-29664
Potential effects of HFC-152a on global ozone and climate
[DE93-008018] p 3471 N93-29792
Air weather service master station catalog USAFETAC climatic database users handbook no. 6
[AD-A264761] p 3484 N93-30608
Oceanographic research towers in european waters
[AD-A264795] p 3489 N93-30612
Deadliest, costliest, and most intense US hurricanes of this century (and other frequently requested hurricane facts)
[PB93-174993] p 3485 N93-30758
Shuttle landing facility cloud cover study: Climatological analysis and two tenths cloud cover rule evaluation
[NASA-CR-193016] p 3272 N93-31033

CLINICAL MEDICINE
DOKMA: A document oriented communication model for medical applications as a basis of a role system in the medical field
[ETN-93-93799] p 3492 N93-28469
Proceedings of a Workshop on Molecular Nuclear Medicine
[DE93-010828] p 3493 N93-28835
The Visible Human Project of the National Library of Medicine: Remote access and distribution of a multi-gigabyte data set p 3617 N93-30453

CLOCKS
The effect of clock, media, and station location errors on Doppler measurement accuracy
p 3246 N93-29588

Foreign technology assessment: Environmental evaluation of a radiation-hard oscillator/divider
[DE93-011481] p 3412 N93-30127

CLOSED ECOLOGICAL SYSTEMS
Earth to lunar CELSS evolution p 3229 N93-29727
Design of biomass management systems and components for closed loop life support systems
p 3230 N93-29728
Automation of closed environments in space for human comfort and safety p 3230 N93-29734

CLOUD COVER
An automated observing system for passive evaluation of cloud cover and visibility
[AD-A263207] p 3481 N93-28875
Sensitivity study of cloud/radiation interaction using a second order turbulence radiative-convective model
[DE93-007365] p 3477 N93-29346
Prognostic cloud water in the Los Alamos general circulation model
[DE93-007381] p 3482 N93-29347
Cloudiest year study: An analysis of the 3DNEPH and RTNEPH databases
[AD-A263409] p 3483 N93-29967
Daily sum of the global radiation: Calculation method and verification of forecast
[KNMI-TR-138] p 3478 N93-30113
STRATUS: A prototype expert advisory system for terminal weather forecasting p 3367 N93-30296
Shuttle landing facility cloud cover study: Climatological analysis and two tenths cloud cover rule evaluation
[NASA-CR-193016] p 3272 N93-31033

CLOUD HEIGHT INDICATORS
Sensitivity study of cloud/radiation interaction using a second order turbulence radiative-convective model
[DE93-007365] p 3477 N93-29346

CLOUD PHYSICS
Activities report of the International Meteorological Institute, Stockholm (Sweden)
[ETN-93-93768] p 3480 N93-28519
A stochastic formation of radiative transfer in clouds
[DE93-011372] p 3484 N93-30055

CLOUDS (METEOROLOGY)
Prognostic cloud water in the Los Alamos general circulation model
[DE93-007381] p 3482 N93-29347
Clouds and radiation: A primer
[AD-A263136] p 3482 N93-29479
Neural network cloud classification research
[AD-A264628] p 3484 N93-30176
Cloud classification from satellite imagery using neural computing p 3367 N93-30297
Cloud Impacts on DOD Operations and Systems Conference (CIDOS-91)
[AD-A264463] p 3484 N93-30535
Uplink laser propagation measurements through the sea surface, haze and clouds
[AD-A264687] p 3440 N93-30553

CLUSTER ANALYSIS
A fuzzy clustering algorithm to detect planar and quadric shapes p 3511 N93-29524
Image segmentation using fuzzy LVQ clustering networks p 3511 N93-29528
Clustering of tethered satellite system simulation data by an adaptive neuro-fuzzy algorithm
p 3512 N93-29535

CLUSTERS
Quantum dynamics of X2BC van der Waals clusters
[DE93-006416] p 3565 N93-28892
Mass spectrometric investigation of 2-methoxyethanol and 2-ethoxyethanol clusters: Magic numbers and structural implications
[AD-A262622] p 3312 N93-29429

CLUTTER
Ground clutter measurements for surface-sited radar
[AD-A262472] p 3379 N93-28655
Multichannel detection of partially correlated signals in clutter
[AD-A261984] p 3381 N93-28998
Classification of radar clutter in an air traffic control environment p 3246 N93-30299
Adaptive filtering for clutter suppression in high frequency radar p 3377 N93-30355
Adaptive airborne radar simulation with equalization filter taps
[AD-A264722] p 3393 N93-30514

CMOS
Analog CMOS circuits for neural networks
p 3355 N93-30223
A single chip high-speed CMOS Viterbi decoder
p 3358 N93-30238
High-speed, CMOS dual modulus frequency divider for RF frequency synthesis p 3359 N93-30245
Performance enhancement of dynamic CMOS logic circuits p 3361 N93-30257
Generation of configurable self-synchronizing synchronous CMOS static RAMs p 3361 N93-30259

Hardness assurance and testing issues for bipolar/BiCMOS devices
[DE93-009623] p 3570 N93-30669

COAL
Magnetohydrodynamic projects at the CDIF
[DE93-012195] p 3584 N93-28649

COAL DERIVED GASES
Development of alternative fuels from coal-derived syngas
[DE93-011629] p 3341 N93-28668

COAL DERIVED LIQUIDS
Advanced thermally-stable, coal-derived, jet fuels program: Experiment system and model development
[AD-A262747] p 3342 N93-29402

COAL GASIFICATION
Development of alternative fuels from coal-derived syngas
[DE93-011629] p 3341 N93-28668
High octane ethers from synthesis gas-derived alcohols
[DE93-012470] p 3341 N93-28752

COASTAL ECOLOGY
Building alliances to restore coastal environments: A coastal America progress report
[PB93-169464] p 3470 N93-29674

COASTAL WATER
Ocean Margins Program
[DE93-008937] p 3470 N93-29262

COASTS
Building alliances to restore coastal environments: A coastal America progress report
[PB93-169464] p 3470 N93-29674
A water mass analysis of the 1991-1992 El Nino signal in the Farallon Islands region
[AD-A263490] p 3488 N93-29819
Deadliest, costliest, and most intense US hurricanes of this century (and other frequently requested hurricane facts)
[PB93-174993] p 3485 N93-30758

COATING
Characterization and optimization of a Hot Air Solder-Leveling System
[DE93-010188] p 3332 N93-29328
Development of adherent ceramic coatings to reduce contact stress damage of ceramics
[DE93-012518] p 3336 N93-30182

COATINGS
Ion-beam-assisted deposition of wear-resistant coatings
[DE93-011529] p 3330 N93-28687
X ray, far, and extreme ultraviolet coatings for space applications p 3340 N93-28829
Effects of vacuum exposure on stress and spectral shift of high reflective coatings
[DE93-009318] p 3437 N93-29207
A simple model for explosives formulation
[DE93-010703] p 3341 N93-29251
Formulation of Ames 24E2 IR-black coating
[NASA-TM-102864] p 3629 N93-29453
Process to prepare 1,3-diamino-5-pentafluorosulfanylbenzene
[NASA-CASE-LAR-14773-2-CU] p 3312 N93-29506
Study of codeposition of aluminum-haffnium and deposition of yttrium by the cementation technique: Elaboration of Ni-Cr-Al and Ni-Cr-Al-Hf felt materials
[ONERA-NT-1990-9] p 3336 N93-30112

COAXIAL CABLES
Leaky coaxial cable signal transmission for remote facilities
[DE93-007916] p 3383 N93-29348

COBALT
Magnetic character investigation of higher alcohol synthesis Cu-Co-Cr catalysts
[DE93-009732] p 3316 N93-30653

COCKPIT SIMULATORS
An evaluation of B-1B pilot performance during simulated instrument approaches with and without status information
[AD-A263874] p 3507 N93-29888
Utility of a ghost horizon and climb/dive ladder line tapering on a head-up display
[AD-A264401] p 3508 N93-30167
NASA/FAA helicopter simulator workshop
[NASA-CP-3156] p 3236 N93-30673
Part 1: Executive summary p 3236 N93-30674
Helicopter simulator standards p 3236 N93-30675

COCKPITS
Oculo-motor responses and virtual image displays
p 3503 N93-28862
Cognitive interface considerations for intelligent cockpits p 3503 N93-28865
Ergonomic development of digital map displays
p 3503 N93-28866
Overview of cockpit technology research and development programs for improvement of the man/machine interface: Review of the AGARD AVP Symposium held in Madrid, May 1992
p 3505 N93-28872

CODE DIVISION MULTIPLE ACCESS
Comparison of multiple access techniques for bandwidth limited land-mobile satellite communications
p 3370 N93-30314

CODERS
Gravity referenced elevation encoder development
p 3385 N93-29592
Robot arm with positional absolute encoded joints
p 3370 N93-30312

CODING
Iterative encoding methods for computer generated holograms
[AD-A263705] p 3431 N93-29297
Nonresident and endangered variables: The effects of code generation optimizations on symbolic debugging
[AD-A263149] p 3529 N93-29486
The general theory of convolutional codes
p 3385 N93-29595
Activities report of PTT Research
[ISBN-9-07-212514-2] p 3392 N93-30025
Feature segmentation using a multiple-stack based chain coding algorithm p 3359 N93-30243
Short-circuit evaluation of Boolean expressions
[CS-9205] p 3552 N93-31014

COEFFICIENT OF FRICTION
Interfacial viscosity measurements of adsorbed monolayers on metal surfaces
[AD-A263288] p 3324 N93-29803
Vehicle dynamic stability and rollover
[PB93-185437] p 3447 N93-30828

COEFFICIENTS
Gas permeability of E/EP semicrystalline diblock copolymers
[AD-A263241] p 3329 N93-28560
Stress-intensity-factor influence coefficients for axial and circumferential flaws in reactor pressure vessels
[DE93-006206] p 3454 N93-30213

COGENERATION
Power generation and transportation systems research department
[PB93-178309] p 3352 N93-30663

COGNITION
Expertise, text coherence, and constraint satisfaction: Effects on harmony and settling rate — mental representations
[AD-A262703] p 3498 N93-28901
Cognitive and Neural Sciences Division 1992 programs
[AD-A263400] p 3654 N93-29258
MoCog1: A computer simulation of recognition-primed human decision making
[NASA-TM-103868] p 3542 N93-29386
Predicting aircrew training performance with psychometric g
[AD-A264021] p 3498 N93-30026
Computing with neural maps: Application to perceptual and cognitive function
[AD-A264056] p 3499 N93-30033
The AFOSR Workshop on the Future of EEG and MEG
[AD-A264338] p 3495 N93-30160
Representations of shape in object recognition and long-term visual memory
[AD-A264342] p 3499 N93-30163
Determinants of performance rating accuracy: A field study
[AD-A264726] p 3500 N93-30575

COGNITIVE PSYCHOLOGY
Expertise, text coherence, and constraint satisfaction: Effects on harmony and settling rate — mental representations
[AD-A262703] p 3498 N93-28901
Representations of shape in object recognition and long-term visual memory
[AD-A264342] p 3499 N93-30163
Neural mechanisms of attention
[AD-A264345] p 3544 N93-30165

COHERENT RADIATION
Undulator Spectromicroscopy Facility at the Advanced Light Source
[DE93-007964] p 3261 N93-28490
Development of coherent x ray lasers
[DE93-009288] p 3437 N93-29104
Optical coherent phase diversity systems
[ISBN-90-9004897-9] p 3578 N93-29270
Microwave emission from relativistic electron beams
[AD-A264102] p 3400 N93-30880

COHERENT SCATTERING
Measurements of light scattering by small particles at an angle of zero degrees
[AD-A263856] p 3580 N93-29887

In-situ temperature and concentration measurements of organosilicon decomposition in a chemical vapor deposition reactor
[ONERA-P-1990-3] p 3313 N93-30109

COHESION
Micropipet manipulation of lipid membranes: Direct measurement of the material properties of a cohesive structure that is only two molecules thick
p 3291 N93-30953

COLD PLASMAS
Numerical modelling of the cold plasma with time-dependent, magnetohydrodynamic methods
[KFK-5053] p 3586 N93-29081
Application of non-standard signal processing to ELF noise characterization for the TSS1-OESEE programme
p 3397 N93-30743
Plasma diffusion through multidipole magnetic fields
[DE93-608548] p 3591 N93-31007

COLD ROLLING
Environmental embrittlement of binary and Zr-doped Ni3Al
[DE93-008575] p 3321 N93-28679

COLD TOLERANCE
Influence of the Cold Buster (tm) sports bar on heat debt, mobilization and oxidation of energy substrates
[AD-A262762] p 3493 N93-28939
Medical aspects of cold weather operations: A handbook for medical officers
[AD-A263559] p 3496 N93-30588
An assessment of peripheral nerve damage in the rat following non-freezing cold exposure: An electrophysiological and histopathological examination
[AD-A264293] p 3492 N93-30818

COLD WEATHER
Medical aspects of cold weather operations: A handbook for medical officers
[AD-A263559] p 3496 N93-30588

COLD WEATHER TESTS
Biophysical model for handwear insulation testing
[AD-A262926] p 3505 N93-28884

COLD WORKING
Examination of formability to seamless tubes on Ni-Cr-W superalloy
[DE93-764158] p 3326 N93-30396

COLLAPSE
Advanced collapsible tank for liquid containment
[NASA-CR-188247] p 3353 N93-28698

COLLISION AVOIDANCE
Results of DATAS investigation of ATCRBS environment at the Los Angeles International Airport
[DOT/FAA/CT-93/6] p 3245 N93-28625
Sensor systems for monitoring Maglev guideway structures
[PB93-154821] p 3444 N93-29205
Graphical interface between the CIRSSE testbed and CimStation software with MCS/CTOS
[NASA-CR-193276] p 3527 N93-29218
Planning collision free paths for two cooperating robots using a divide-and-conquer C-space traversal heuristic
[NASA-CR-193252] p 3542 N93-29771
Optimal geometric design of robots for environments with obstacles p 3445 N93-30149
Issues of ATC conflict resolution under real-time constraints p 3247 N93-30350

COLLISION PARAMETERS
A possibility to investigate the superconducting gap with the help of neutrons
[DE93-606392] p 3601 N93-30799
Single t-quark production in high energy (gamma)e collisions
[DE92-644947] p 3572 N93-30930

COLLISION RATES
Estimation of droplet collision frequency in a spray
[DE93-007991] p 3416 N93-28566

COLLISIONS
Proceedings of the Near-Earth-Object Interception Workshop
[NASA-TM-108236] p 3556 N93-28572
Stellar encounters in globular clusters
p 3632 N93-28606
Why Blue stragglers formed via collisions may not be rapid rotators
[DE93-008708] p 3633 N93-28905
Do the Pop 2 field blue stragglers have a collisional origin?
[DE93-008709] p 3634 N93-28906
Can physical stellar collisions explain the blue stragglers in the dwarf spheroidal galaxies?
[DE93-008711] p 3634 N93-28907
Catastrophic collisions: Laboratory impact experiments, hydrocode simulations, and the scaling problem
p 3635 N93-30411

COLLOIDS
Colloid and interface chemistry aspects of ceramics
[AD-A264685] p 3337 N93-30552

COLORADO PLATEAU (US)
Environmental Monitoring and Assessment Program. EMAP: Arid Colorado plateau pilot study
[PB93-181618] p 3474 N93-30823

COLUMBIA (ORBITER)
APU diaphragm testing
[NASA-TM-108254] p 3272 N93-29501

COLUMBUS SPACE STATION
Assessment of Columbus payload operations capabilities by scheduling with the MARS system
[ESA-STR-235] p 3281 N93-30106

COMBAT
Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies
[AGARD-CP-520] p 3501 N93-28850
X-31 demonstration of integrated flight and propulsion control for effective combat at extreme angles of attack
p 3260 N93-28851
Planning for air to air combat p 3501 N93-28852
Computer assisted evaluation for air close combat based on time interval characterization p 3504 N93-28868
Sound attenuation characteristics of the standard DH-132A and SPH-4 helmets worn in combination with standard issue earplugs
[AD-A263011] p 3506 N93-29406

COMBINATORIAL ANALYSIS
How to select combination operators for fuzzy expert systems using CRI p 3510 N93-29521
Polynomial space polynomial delay algorithms for listing families of graphs
[DE93-010677] p 3530 N93-29808
Parametric and combinatorial problems in constrained optimization
[AD-A264229] p 3555 N93-30363

COMBUSTIBLE FLOW
Turbulence characteristics of an axisymmetric reacting flow
[NASA-CR-4110] p 3242 N93-30373

COMBUSTION
Programmer's reference guide to FDMS file formats
[PB93-182038] p 3354 N93-29663
ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials
[CPIA-PUBL-589] p 3343 N93-30061
Energetic material response to abnormal environments p 3350 N93-30095

COMBUSTION CHAMBERS
Magnetohydrodynamic projects at the CDIF
[DE93-012195] p 3584 N93-28649
Application of Schlieren optical techniques for the measurement of gas temperature and turbulent diffusivity in a diesel engine
[AD-A263810] p 3580 N93-29880
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-527] p 3252 N93-29926
The effect of main stream flow angle on flame tube film cooling p 3257 N93-29953
Impingement/effusion cooling p 3257 N93-29954
Evaluation of multi-dimensional flux models for radiative transfer in cylindrical combustion chambers
p 3257 N93-29955
Calculations of reactive turbulent flows in aeronautical chambers p 3257 N93-29956
Method of fabricating a rocket engine combustion chamber
[NASA-CASE-MFS-28569-1] p 3338 N93-30565
Thrust augmentation system for low-cost-expendable turbojet engine
[AD-A263727] p 3259 N93-30877

COMBUSTION CHEMISTRY
Generation of carbon monoxide in compartment fires
[PB93-146702] p 3244 N93-29211
Response of energetic solids to light, heat and shock pulses
[AD-A263702] p 3342 N93-29296
Calculations of reactive turbulent flows in aeronautical chambers p 3257 N93-29956
Combustion/explosion chemistry of bulk materials
p 3343 N93-30062
The thermochemistry and reaction pathways of the decomposition and combustion of energetic materials
p 3343 N93-30063
Determination of gas phase species and temperature profiles above solid propellants p 3346 N93-30080
Thermal decomposition pathways of RDX in the condensed phase p 3347 N93-30083
Unsteady combustion of energetic materials using laser-recoil p 3319 N93-30085
Rate constant determinations of reactions H + HNO from ab initio reaction path calculations
p 3319 N93-30099

COMBUSTION PHYSICS
Weakly nonlinear dynamics of near-CJ detonation waves
[DE93-007344] p 3424 N93-29836
ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials
[CPIA-PUBL-589] p 3343 N93-30061
Combustion/explosion chemistry of bulk materials
p 3343 N93-30062
Propulsion and detonics research in France
p 3344 N93-30070
The outlook for understanding the combustion of solid propellants and what it will take p 3346 N93-30078
Dislocation roles in energetic crystal responses
p 3348 N93-30086
Homogeneous gas phase kinetic model with gradient sensitivity analysis for high temperature particulate boron combustion in fluorine enriched environments
p 3319 N93-30090
NOx chemistry in natural gas flames
[PB93-175263] p 3317 N93-30760
Thrust augmentation system for low-cost-expendable turbojet engine
[AD-A263727] p 3259 N93-30877

COMBUSTION PRODUCTS
Generation of carbon monoxide in compartment fires
[PB93-146702] p 3244 N93-29211
Multi-Attribute Decision Theory methodology for pollution control measure analysis
[DE93-005444] p 3472 N93-30008
Kinetic studies on gas-phase reaction mechanisms important to the combustion of energetic materials: The CO/N2O reaction p 3347 N93-30084
Unsteady combustion of energetic materials using laser-recoil p 3319 N93-30085
Direct Monte Carlo simulation of the chemical equilibrium composition of detonation products
[DE92-040372] p 3315 N93-30447
Detailed studies of soot formation in laminar diffusion flames for application to modeling studies
[AD-A264827] p 3317 N93-30667

COMBUSTION STABILITY
Weakly nonlinear dynamics of near-CJ detonation waves
[DE93-007344] p 3424 N93-29836
Contribution to the study of the interaction between acoustic waves and coherent structures induced by a prismatic cylinder in a rectangular cavity
[ONERA-NT-1990-10] p 3314 N93-30203
Detailed studies of soot formation in laminar diffusion flames for application to modeling studies
[AD-A264827] p 3317 N93-30667

COMBUSTION SYNTHESIS
Explosive consolidation of combustion synthesized TiC and TiB2: Precursor morphology effects
[AD-A263186] p 3341 N93-28515
Methylhydridopolysilazane and its pyrolytic conversion to Si3N4/SiC ceramics
[AD-A264150] p 3336 N93-30170

COMETS
Space optical and low-frequency radio searches for Earth-crossing asteroids and comets
[DE93-008716] p 3634 N93-29246
Asteroidal versus cometary meteoroid impacts on the Long Duration Exposure Facility (LDEF)
p 3638 N93-29371

COMFORT
Discomfort glare from high-intensity discharge headlamps: Effects of context and experience
[PB93-174720] p 3496 N93-30659

COMMAND AND CONTROL
Advanced Unmanned Search System (AUSS) supervisory command, control and navigation
[AD-A263171] p 3245 N93-28990
Using today's technology to improve mobile C4I for the operational commander
[AD-A263613] p 3245 N93-29285
T(lc2)acS(lc3)ats for Surveillance Verification and C3I
[AGARD-CP-522] p 3387 N93-29892
TACSAT ground control and data collection
p 3388 N93-29895
TACSAT-spacecraft bus concept and design: Application of a multimission bus for TACSAT in LEO
p 3284 N93-29896
Tactical satellites for air command and control
p 3284 N93-29898
Consultative Committee for Space Data Systems recommendation for space data system standards: Telecommand. Part 2.1: Command operation procedures
[NASA-TM-108158] p 3393 N93-30371
VLF/LF propagation measurements
p 3395 N93-30732

COMMERCE
Defense conversion: Redirecting research and development
[OTA-ITE-552] p 3610 N93-29649
Advanced network technology: Background paper
[OTA-BP-TCT-101] p 3539 N93-29650

The 1992 World Administrative Radio Conference: Technology and Policy Implications
[OTA-TCT-549] p 3392 N93-30150
US space commerce, 1991 p 3625 N93-30695
The role of the University Licensing Office in transferring intellectual property to industry p 3626 N93-30698
National Technology Transfer Center
p 3626 N93-30700
Proceedings of the meeting of the Intergovernmental US-Russian Business Development Committee's Standards Working Group
[PB93-179968] p 3610 N93-30822

COMMERCIAL AIRCRAFT
World commercial aircraft accidents
[DE93-010892] p 3243 N93-28571
Effects of intra- and inter-laminar resin content on the mechanical properties of toughened composite materials
p 3303 N93-30845
Process and assembly plans for low cost commercial fuselage structure p 3306 N93-30865

COMMERCIAL SPACECRAFT
US space commerce, 1991 p 3625 N93-30695

COMMUNICATION EQUIPMENT
Time delay measurements of current primary FAA air/ground transmitters and receivers
[DOT/FAA/CT-TN93/14] p 3379 N93-28555
Evaluation of test methods and requirements for respiratory protection systems 21
[AD-A262466] p 3501 N93-28757
The NASA SBIR product catalog
[NASA-TM-108242] p 3609 N93-29322
The 1992 World Administrative Radio Conference: Technology and Policy Implications
[OTA-TCT-549] p 3392 N93-30150

COMMUNICATION NETWORKS
A survey of network interface designs
[MEMO-INF-92-59] p 3379 N93-28502
National collaboratories: Applying information technology for scientific research
[LC-93-83795] p 3612 N93-29129
A comparison of high-speed links, their commercial support and ongoing R/D activities
[DE93-008134] p 3382 N93-29245
Communications neural net processors
[AD-A263330] p 3542 N93-29763
Ethernet performance of the Motorola Altair WIN system
[AD-A263877] p 3387 N93-29890
T(lc2)acS(lc3)ats for Surveillance Verification and C3I
[AGARD-CP-522] p 3387 N93-29892
TACSAT-spacecraft bus concept and design: Application of a multimission bus for TACSAT in LEO
p 3284 N93-29896
Advanced HF digital networks p 3375 N93-30343
Changing role of telecommunications management in air traffic control in the FAA p 3247 N93-30354
High performance computing and communications program p 3627 N93-30715
ELF/VLF/LF Radio Propagation and Systems Aspects
[AGARD-CP-529] p 3394 N93-30727
VLF/LF propagation measurements
p 3395 N93-30732
Viability assessment for reliable long-wave communication links p 3399 N93-30754
Orbiting transmitter and antenna for spaceborne communications at ELF/VLF to submerged submarines
p 3399 N93-30755

COMMUNICATION SATELLITES
Power beaming to communication satellites in GEO
[DE93-007608] p 3279 N93-29840
On-board B-ISDN fast packet switching architectures. Phase 2: Development. Proof-of-concept architecture definition report
[NASA-CR-191151] p 3273 N93-29884
T(lc2)acS(lc3)ats for Surveillance Verification and C3I
[AGARD-CP-522] p 3387 N93-29892
Tactical satellites p 3284 N93-29893
Evolution or revolution: The Catch 22 of TACSATs
p 3269 N93-29894
TACSAT-spacecraft bus concept and design: Application of a multimission bus for TACSAT in LEO
p 3284 N93-29896
Tactical satellites for air command and control
p 3284 N93-29898
Considerations for NATO satellite communications in the post-2000 era p 3388 N93-29899
Advanced technologies for lightweight EHF tactical communications satellites p 3389 N93-29900
Synchronization techniques for medium data rate EHF MILSATCOM systems p 3389 N93-29901
Terrain and coverage prediction analyses for non-geostationary orbit EHF satellite communications
p 3389 N93-29902
Launch vehicles for lightweight TACSAT deployment
p 3271 N93-29903
Spacecraft and launch systems for TACSAT applications p 3284 N93-29904
Attitude- and Orbit Control Subsystem concepts for TACSATS p 3284 N93-29906
Cost effective TacSats for military support
p 3285 N93-29912
Canadian EHF MILSATCOM research and development project p 3362 N93-30264
SAW technology for on-board processing in military satellite communications p 3362 N93-30265
FASSET: A development model for a Canadian EHF MILSATCOM system p 3363 N93-30268
Adaptive jammer nulling in EHF communications satellites p 3365 N93-30284
A dual polarized broadband multifrequency Earth station feed p 3371 N93-30319
US space commerce, 1991 p 3625 N93-30695

COMMUNICATION THEORY
Uncorrectable sequences and telecommand
p 3385 N93-29596

COMPACTING
Colloid and interface chemistry aspects of ceramics
[AD-A264685] p 3337 N93-30552

COMPANION STARS
The multiplicity of T Tauri stars in the star forming regions Taurus-Auriga and Ophiuchus-Scorpius: A 2.2 micron speckle imaging survey p 3634 N93-28945
Effects of spiral shocks on disk emission lines
[DE92-641716] p 3637 N93-31004

COMPARISON
Filtering interpolators for image comparison algorithms
p 3463 N93-28797
ERS-1 directional wave spectra validation with the airborne SAR PHARS
[BCRS-92-18] p 3463 N93-31010

COMPARTMENTS
Generation of carbon monoxide in compartment fires
[PB93-146702] p 3244 N93-29211

COMPATIBILITY
APU diaphragm testing
[NASA-TM-108254] p 3272 N93-29501
Compatibility studies of AISI type 316 stainless steel with lead-lithium eutectic alloy
[DE93-605281] p 3328 N93-31022

COMPENSATORS
Robust feedforward/feedback control synthesis for uncertain dynamical systems p 3542 N93-29079
Three-parameter tunable Tilt-Integral-Derivative (TID) controller
[NASA-CASE-NPO-18492-1-CU] p 3542 N93-29176
Division by polynomial matrix and its application to multivariable linear systems p 3357 N93-30233

COMPILERS
Installation of a new Fortran compiler and effective programming method on the vector supercomputer
[DE93-753322] p 3524 N93-28537
Compiler-assisted multiple instruction rollback recovery using a read buffer
[NASA-CR-193175] p 3527 N93-29170
Implementing error-valued semantics for dataflow languages on imperative machines
[DE93-009319] p 3615 N93-29310
Nonresident and endangered variables: The effects of code generation optimizations on symbolic debugging
[AD-A263149] p 3529 N93-29486
Development of a PC code package for the analysis of research and power reactors
[DE92-638517] p 3536 N93-31001

COMPLEX COMPOUNDS
Applications of transition metal compounds in the preparation of useful silicon-containing ceramics
[AD-A264028] p 3335 N93-30028
Applications of density functional theory to calculation of reaction energetics p 3351 N93-30098
Complex-compound heat pump: Topical report on phase 1 results
[PB93-185460] p 3466 N93-30814

COMPLEX SYSTEMS
A neuro-fuzzy architecture for real-time applications
p 3511 N93-29529
Some problems with the design of self-learning management systems p 3516 N93-29559
Fuzzy simulation in concurrent engineering
p 3516 N93-29562
Automated modeling of physical systems
[NASA-CR-193256] p 3531 N93-29873
Intelligent real-time problem solving
[AD-A264830] p 3535 N93-30614
Graphical programming: On-line robot simulation for telerobotic control
[DE93-009796] p 3447 N93-30654

COMPONENT RELIABILITY
High-efficiency high-reliability optical components for a large, high-average-power visible laser system
[DE93-009225] p 3437 N93-29098
Research on reconfigurable and reliable manipulators
[DE93-010244] p 3444 N93-29330
NetStat: A probabilistic network connectivity analysis tool
[AD-A262838] p 3529 N93-29647
Fault tolerance and testing for WSI systems
p 3361 N93-30258

COMPOSITE MATERIALS
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-009] p 3322 N93-29015
JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-92-012] p 3296 N93-29016

JPRS report: Science and technology. Central Eurasia: Materials science
[JPRS-UMS-93-001] p 3296 N93-29021
Sensor systems for monitoring Maglev guideway structures
[PB93-154821] p 3444 N93-29205
Advanced technology composite aircraft structures
[NASA-CR-190420] p 3248 N93-29498
Semiconductor cooling apparatus
[NASA-CASE-LEW-14162-3] p 3299 N93-29614
Scattering through apertures and by three-dimensional structures. Application to the measurement of the surface impedance of conductive materials
[ONERA-P-1990-2] p 3392 N93-30018
The First NASA Advanced Composites Technology Conference, part 1
[NASA-CP-3104-PT-1] p 3300 N93-30428
Composites: A viable option p 3300 N93-30429
Advanced composite structural concepts and material technologies for primary aircraft structures
p 3300 N93-30430
Composites technology for transport primary structure
p 3300 N93-30431
Advanced technology commercial fuselage structure
p 3300 N93-30432
Design and manufacturing concepts for thermoplastic structures p 3301 N93-30434
Resin transfer molding for advanced composite primary aircraft structures p 3301 N93-30438
Lessons learned for composite structures
p 3302 N93-30444
Measurement of electromagnetic properties of composite materials
[AD-A264725] p 3303 N93-30555
Infiltration/cure modeling of resin transfer molded composite materials using advanced fiber architectures
p 3303 N93-30843
Powder towpreg process development
p 3303 N93-30844
Development of resins for composites by resin transfer molding p 3305 N93-30853
An overview of the crash dynamics failure behavior of metal and composite aircraft structures
p 3308 N93-30875
New materials: Fountainhead for new technologies and new science p 3291 N93-30952
Introduction to high performance composites
p 3291 N93-30957
Construction and testing of simple airfoils to demonstrate structural design, materials choice, and composite concepts p 3243 N93-30979
Advanced electromagnetic methods for aerospace vehicles
[NASA-CR-193468] p 3400 N93-31036

COMPOSITE PROPELLANTS
Damage growth in composite propellants
p 3348 N93-30088

COMPOSITE STRUCTURES
Influence of ply waviness on stiffness and strength reduction of composite laminates
[AD-A263224] p 3294 N93-28559
A thermal stress solution for multilayered composite cylinders
[AD-A262579] p 3295 N93-28657
Analysis for thermo-chemical decomposition of composite structures
[NASA-CR-193185] p 3295 N93-28843
Nonlinear analyses of composite aerospace structures in sonic fatigue
[NASA-CR-193124] p 3451 N93-29154

Technology transfer personnel exchange at the Boeing Company
[DE93-010190] p 3625 N93-29329

Advanced technology composite aircraft structures
[NASA-CR-190420] p 3248 N93-29498

Static and dynamic large deflection flexural response of graphite-epoxy beams
[NASA-CR-4118] p 3454 N93-30374

The First NASA Advanced Composites Technology Conference, part 1
[NASA-CP-3104-PT-1] p 3300 N93-30428

Composites: A viable option p 3300 N93-30429

Advanced composite structural concepts and material technologies for primary aircraft structures
p 3300 N93-30430

Composites technology for transport primary structure
p 3300 N93-30431

Advanced technology commercial fuselage structure
p 3300 N93-30432

Design, analysis, and fabrication of the technology integration box beam p 3300 N93-30433

Design and manufacturing concepts for thermoplastic structures p 3301 N93-30434

Structural evaluation of curved stiffened composite panels fabricated using a THERM-Xsm process
p 3301 N93-30435

Noise transmission properties and control strategies for composite structures p 3301 N93-30436

Long discontinuous fiber composite structure: Forming and structural mechanics p 3301 N93-30437

Resin transfer molding for advanced composite primary aircraft structures p 3301 N93-30438

Consolidation of graphite thermoplastic textile preforms for primary aircraft structure p 3302 N93-30439

Cost studies for commercial fuselage crown designs
p 3302 N93-30440

A unified approach for composite cost reporting and prediction in the ACT program p 3302 N93-30441

F-15 composite engine access door
p 3302 N93-30442

Fabrication of the V-22 composite AFT fuselage using automated fiber placement p 3302 N93-30443

Lessons learned for composite structures
p 3302 N93-30444

Development of stitching reinforcement for transport wing panels p 3304 N93-30852

Advanced fiber/matrix material systems
p 3305 N93-30854

Mechanical and analytical screening of braided composites for transport fuselage applications
p 3305 N93-30855

Ultrasonic detection and identification of fabrication defects in composites p 3305 N93-30856

Multi-parameter optimization tool for low-cost commercial fuselage crown designs
p 3305 N93-30858

Comparison of hand laid-up tape and filament wound composite cylinders and panels with and without impact damage p 3306 N93-30859

Effects of scale in predicting global structural response p 3306 N93-30860

Optimization of composite sandwich cover panels subjected to compressive loadings p 3306 N93-30862

Process and assembly plans for low cost commercial fuselage structure p 3306 N93-30865

Probabilistic composite analysis p 3307 N93-30868

A Rayleigh-Ritz analysis methodology for cutouts in composite structures p 3307 N93-30869

Prediction of stiffener-skin separation in composite panels p 3307 N93-30871

Evaluation of some scale effects in the response and failure of composite beams p 3308 N93-30874

An overview of the crash dynamics failure behavior of metal and composite aircraft structures
p 3308 N93-30875

COMPOUND A

Marine microbial production of dimethylsulfide from dissolved dimethylsulfoniopropionate
[NASA-CR-193278] p 3492 N93-30665

COMPOUNDING

Aluminium-high strength material by mechanical alloying and reaction milling: Basics of processing and characterisation of material
[ESA-TT-1249] p 3324 N93-29272

COMPRESSED AIR

Prefeasibility study on compressed air energy storage systems
[VTT-TIED-1267] p 3465 N93-30111

COMPRESSIBILITY EFFECTS

Studies of hydrogen-air diffusion flames and of compressibility effects related to high-speed propulsion
p 3310 N93-29125

COMPRESSIBLE FLOW

Analysis of unsteady wave processes in a rotating channel
[NASA-CR-191154] p 3251 N93-28617

The hydraulic analysis of cylindrical Flibe jets in a HYLIFE-2 ICF reactor
[DE93-009234] p 3586 N93-29053

Nonlinear relaxation algorithms for the compressible Navier-Stokes equations in two and three dimensions
p 3421 N93-29177

Heat transfer and leakage in high-speed rotating stepped labyrinth seals p 3256 N93-29951

Compressible turbulence in a high-speed high Reynolds number mixing layer p 3242 N93-30583

COMPRESSIBLE FLUIDS

Godunov-type methods for the equations of compressible fluid mechanics
[KFK-5058] p 3428 N93-31020

COMPRESSING

Dual arm generalized compliant motion with shared control
[NASA-CASE-NPO-18738-1-CU] p 3443 N93-28954

COMPRESSION LOADS

Isothermal and shock compression of high density ammonium nitrate and ammonium perchlorate
[DE93-000682] p 3315 N93-30209

Reactive sintering of Ni3Al intermetallic alloys under compressive stress
[DE93-009729] p 3327 N93-30652

Comparison of hand laid-up tape and filament wound composite cylinders and panels with and without impact damage p 3306 N93-30859

Optimization of composite sandwich cover panels subjected to compressive loadings p 3306 N93-30862

Prediction of stiffener-skin separation in composite panels p 3307 N93-30871

Experimental behavior of graphite-epoxy Y-stiffened specimens loaded in compression p 3307 N93-30872

COMPRESSION RATIO

High resolution free-electron laser spectroscopy
[AD-A263734] p 3439 N93-29853

Elastic stability considerations for deep submergence ceramic pressure housing
[AD-A264824] p 3454 N93-30598

COMPRESSION WAVES

Three-dimensional numerical simulation of gradual opening in a wave rotor passage
[NASA-CR-191157] p 3252 N93-29072

Shock waves and polymorphic phase transitions in energetic materials p 3351 N93-30100

COMPRESSIVE STRENGTH

Environmental effects on stitched RTM composites
[NASA-CR-193221] p 3297 N93-29107

Studies of fiber-matrix adhesion on compression strength p 3304 N93-30846

Comparison of impact results for several polymeric composites over a wide range of low impact velocities
p 3304 N93-30848

Effects of bolt-hole contact on bearing-bypass damage-onset strength p 3307 N93-30870

COMPRESSOR BLADES

Three-dimensional fiber-optic LDV measurements in the endwall region of a linear cascade of controlled-diffusion stator blades
[AD-A263513] p 3424 N93-29968

COMPRESSOR ROTORS

Transient thermal behaviour of a compressor rotor with axial cooling air flow and co-rotating or contra-rotating shaft p 3255 N93-29946

Flow and heat transfer between gas-turbine discs
p 3256 N93-29950

COMPRESSORS

Thrust augmentation system for low-cost-expendable turbojet engine
[AD-A263727] p 3259 N93-30877

COMPTON EFFECT

Construction and testing of a neutron and gamma spectrometry system using pulse shape discrimination with an organic scintillator
[AD-A262550] p 3567 N93-29415

Quantum field theory in spaces with closed time-like curves
[DE93-010564] p 3605 N93-30481

COMPUTATION

A proposed approach for developing next-generation computational electromagnetics software
[DE93-007326] p 3380 N93-28900

Research in efficient scientific computation
[AD-A262084] p 3525 N93-28986

Exploiting the memory hierarchy in sequential and parallel sparse Cholesky factorization
[AD-A262849] p 3539 N93-29508

Fuzzy multiple linear regression: A computational approach p 3518 N93-29574

Computation and generalization in neural networks
[AD-A263752] p 3549 N93-29871

Analysis and computation for vortex dynamics and rarefied gases
[AD-A264705] p 3427 N93-30499

COMPUTATIONAL CHEMISTRY

Applications of density functional theory to calculation of reaction energetics p 3351 N93-30098

Rate constant determinations of reactions H + HNO from ab initio reaction path calculations
p 3319 N93-30099

Shock waves and polymorphic phase transitions in energetic materials p 3351 N93-30100

Use of statistics in computational chemistry
[AD-A264307] p 3315 N93-30365

The 26th International Quantum Chemistry Symposium on Atomic, Molecular, and Condensed Matter Theory and Computational Methods
[AD-A264206] p 3315 N93-30534

COMPUTATIONAL FLUID DYNAMICS

Navier-Stokes analysis of radial turbine rotor performance
[NASA-CR-191153] p 3251 N93-28609

Accelerated motion of rigid spheres in unsteady flows at low to moderate Reynolds numbers
p 3416 N93-28612

Analysis of unsteady wave processes in a rotating channel
[NASA-CR-191154] p 3251 N93-28617

A new flux conserving Newton's method scheme for the two-dimensional, steady Navier-Stokes equations
[NASA-TM-106160] p 3416 N93-28626

A grid refinement study of two-dimensional transient flow over a backward-facing step using a spectral-element method
[DE92-018262] p 3417 N93-28639

Numerical simulation of perfect fluid flows around complex 3D configurations by a multidomain solver using the MUSCL approach p 3417 N93-28745

The development of a mixing layer under the action of weak streamwise vortices
[NASA-TM-106089] p 3418 N93-28947

Inviscid quasi one-dimensional nonequilibrium flow
[FFA-TN-1992-35] p 3418 N93-28993

Implementation of a multidomain Navier-Stokes code on the Intel iPSC2 hypercube
[FFA-TN-1992-37] p 3418 N93-28994

The numerical solution of low Mach number flow in confined regions by Richardson extrapolation
[TRITA-NA-9207] p 3238 N93-29005

An efficient spectral integration method for the solution of the Navier-Stokes equations
[FFA-TN-1992-28] p 3418 N93-29009

Pre- and postprocessing techniques for determining goodness of computational meshes
[NASA-CR-192553] p 3538 N93-29030

State vector splitting: A numerical scheme for the Euler equations p 3419 N93-29039

Stabilized space-time finite element formulations for unsteady incompressible flows involving fluid-body interactions p 3419 N93-29040

Studies of hydrogen-air diffusion flames and of compressibility effects related to high-speed propulsion
p 3310 N93-29125

The 3-D viscous flow CFD analysis of the propeller effect on an advanced ducted propeller subsonic inlet
[NASA-TM-106240] p 3252 N93-29162

Accuracy of least-squares methods for the Navier-Stokes equations
[NASA-TM-106209] p 3421 N93-29208

Numerical computation of inviscid flow around nose tip of Space Shuttle with NND scheme
[AD-A264012] p 3421 N93-29260

An upwind method for the solution of the 3D Euler and Navier-Stokes equations on adaptively refined meshes
[AD-A262863] p 3423 N93-29472

Recent applications of CFD to the aerodynamics of Army projectiles
[AD-A262953] p 3240 N93-29512

A parallel implicit incompressible flow solver using unstructured meshes
[AD-A263395] p 3424 N93-29851

Solution of Euler equations for forebody-inlet ensemble of aircraft at high angle of attack
[AD-A263905] p 3240 N93-29862

The application of concentric vortex simulation to calculating the aerodynamic characteristics of bodies of revolution at high angles of attack
[AD-A263879] p 3241 N93-29919

Aerothermic calculations of flows in interdisc cavities of turbines p 3256 N93-29947

Study of flow structure in rotating cavities: Numerical predictions of laminar and turbulent, steady, and unsteady flows p 3256 N93-29948

Modelling thermal behaviour of turbomachinery discs and casings p 3256 N93-29949

Flow and heat transfer between gas-turbine discs
p 3256 N93-29950

Aero-thermal design of a cooled transonic NGV and comparison with experimental results
p 3257 N93-29957

The aerodynamic effect of coolant ejection in the leading edge region of a film-cooled turbine blade p 3258 N93-29958

Coupling of 3D-Navier-Stokes external flow calculations and internal 3D-heat conduction calculations for cooled turbine blades p 3258 N93-29961

A Navier-Stokes solver with different turbulence models applied to film-cooled turbine cascades p 3258 N93-29962

Navier-Stokes analysis of three-dimensional flow and heat transfer inside turbine blade rows p 3259 N93-29963

On high resolution extensions of Lagrange-Galerkin finite-element schemes [INRIA-RR-1703] p 3550 N93-30117

A computational model that couples aerodynamic and structural dynamic behavior of parachutes during the opening process [AD-A264115] p 3241 N93-30119

Difference methods for hyperbolic problems with emphasis on space-centered approximations [ONERA-NT-1990-4] p 3550 N93-30136

Use of a genetic algorithm to solve two-fluid flow problems on an NCUBE multiprocessor computer [DE93-009630] p 3425 N93-30184

Simulation, characterization and control of forced unsteady viscous flows using Navier-Stokes equations [AD-A264333] p 3425 N93-30369

Topology and grid adaption for high-speed flow computations [NASA-CR-4216] p 3426 N93-30375

Development of a CFD code for casting simulation [NASA-CR-192577] p 3427 N93-30492

Computational fluid dynamics research on dynamically adaptive mesh methods for transonic flows [AD-A264833] p 3428 N93-30630

Turbulent drag reduction: Studies of feedback control and flow over riblets p 3242 N93-30645

An adaptive Lagrangian method for computing 1-D reacting flows and the theory of Riemann invariant manifolds for the compressible Euler equations p 3428 N93-30902

The numerical simulation of circulation controlled airfoil flowfields p 3243 N93-30947

Godunov-type methods for the equations of compressible fluid mechanics [KFK-5058] p 3428 N93-31020

The HSCT mission analysis of waverider designs [NASA-CR-193467] p 3243 N93-31037

COMPUTATIONAL GEOMETRY

Robust and efficient implementation of the Delaunay tree [INRIA-RR-1619] p 3547 N93-28511

The space of spheres, a geometric tool to unify duality results in Voronoi diagrams [INRIA-RR-1620] p 3547 N93-28512

Implementation of parallel algorithms [AD-A263126] p 3529 N93-29496

COMPUTATIONAL GRIDS

Design of an essentially non-oscillatory reconstruction procedure in finite-element type meshes [INRIA-RR-1584] p 3547 N93-28615

A grid refinement study of two-dimensional transient flow over a backward-facing step using a spectral-element method [DE92-018262] p 3417 N93-28639

Pre- and postprocessing techniques for determining goodness of computational meshes [NASA-CR-192553] p 3538 N93-29030

Design optimization of space structures p 3278 N93-29122

The three-dimensional Multi-Block Advanced Grid Generation System (3DMAGGS) [NASA-TM-108985] p 3420 N93-29155

Nonlinear relaxation algorithms for the compressible Navier-Stokes equations in two and three dimensions p 3421 N93-29177

Ablation problems using a finite control volume technique [DE93-009861] p 3549 N93-29187

Development of a new technique for image reconstruction, enhancement, and visualization [AD-A263145] p 3528 N93-29483

On high resolution extensions of Lagrange-Galerkin finite-element schemes [INRIA-RR-1703] p 3550 N93-30117

Simulation, characterization and control of forced unsteady viscous flows using Navier-Stokes equations [AD-A264333] p 3425 N93-30369

Topology and grid adaption for high-speed flow computations [NASA-CR-4216] p 3426 N93-30375

A method for intersection line calculation between parametric surfaces [ETN-93-94178] p 3551 N93-30572

Computational fluid dynamics research on dynamically adaptive mesh methods for transonic flows [AD-A264833] p 3428 N93-30630

An adaptive Lagrangian method for computing 1-D reacting flows and the theory of Riemann invariant manifolds for the compressible Euler equations p 3428 N93-30902

COMPUTER AIDED DESIGN

An investigation of stereolithography as a means of prototyping from a cad database [AD-A263410] p 3613 N93-29210

Iterative encoding methods for computer generated holograms [AD-A263705] p 3431 N93-29297

Advanced Construction Technology Center research [AD-A263654] p 3432 N93-29390

An MCM/chip concurrent engineering validation [AD-A262959] p 3409 N93-29513

Concept design example, Computer Aided Structural Modeling (CASM). Scheme A [AD-A264759] p 3529 N93-29657

Concept design example, Computer Aided Structural Modeling (CASM). Scheme B [AD-A264760] p 3529 N93-29658

Effect of design selection on response surface performance [NASA-CR-4520] p 3249 N93-29885

Robust control of intelligent rotor [AD-A263707] p 3259 N93-29985

Airspace Design Expert System (ADES), a 2D/3D mapping and modelling tool incorporating an expert system for use in instrument approach design p 3247 N93-30357

An application protocol for CAD to CAD transfer of electronic information [AD-A264554] p 3533 N93-30383

A unified approach for composite cost reporting and prediction in the ACT program p 3302 N93-30441

Memory driven feature-based design [AD-A264697] p 3534 N93-30495

Electronics mixed-mode simulation [AD-A264734] p 3534 N93-30577

Multi-parameter optimization tool for low-cost commercial fuselage crown designs p 3305 N93-30858

4D interconnect experimental development [AD-A264298] p 3540 N93-30895

COMPUTER AIDED MANUFACTURING

Soft computing in design and manufacturing of advanced materials [NASA-TM-106032] p 3295 N93-28624

A virtual environment for manufacturing systems [AD-A263128] p 3528 N93-29473

Memory driven feature-based design [AD-A264697] p 3534 N93-30495

COMPUTER AIDED TOMOGRAPHY

Use of local x ray computerized tomography for high-resolution, region-of-interest inspection of large ceramic components for engines [DE93-005564] p 3449 N93-28943

The parallel implementation of a backpropagation neural network and its applicability to SPECT image reconstruction [DE93-010304] p 3567 N93-29416

COMPUTER ASSISTED INSTRUCTION

Development of a concept formulation process aid for analyzing training requirements and developing training devices [AD-A263579] p 3261 N93-29972

Review of the effectiveness of video media in instruction [AD-A264228] p 3392 N93-30362

COMPUTER COMPATIBLE TAPES

ICI optical data storage tape: An archival mass storage media p 3621 N93-30472

Flexible storage medium for write-once optical tape p 3621 N93-30473

Analysis of cache for streaming tape drive p 3435 N93-30477

COMPUTER DESIGN

Spacecraft computer technology at Southwest Research Institute p 3522 N93-28813

SEU tolerant computer based on the R3000 [DE93-009294] p 3520 N93-29058

Efficient wiring of reconfigurable parallel processors [DE93-009847] p 3538 N93-29186

Using today's technology to improve mobile C4I for the operational commander [AD-A263613] p 3245 N93-29285

Canadian Conference on Electrical and Computer Engineering, volumes 1 and 2 [ISBN-0-9694170-1-2] p 3354 N93-30215

High performance computing and communications program p 3627 N93-30715

COMPUTER GRAPHICS

Rendering the out-the-window view for the AFIT virtual cockpit [AD-A262599] p 3260 N93-28467

JPDRAW user's manual, version 3.3 [INRIA-RT-0139] p 3523 N93-28504

Dynamic object oriented interaction and its implementation in the framework in an interface management system [ETN-93-93795] p 3523 N93-28526

Toward reusable graphics components in Ada [AD-A262568] p 3524 N93-28577

Ergonomic development of digital map displays p 3503 N93-28866

Initial graphics exchange specification hybrid microcircuit application protocol [PB93-175404] p 3407 N93-29203

A distributed system for visualizing and analyzing multivariate and multidisciplinary data p 3613 N93-29226

The scientific modeling assistant: An advanced software tool for scientific model building p 3613 N93-29229

DataHub knowledge based assistance for science visualization and analysis using large distributed databases p 3613 N93-29230

A planetary version of PC-McIDAS p 3614 N93-29236

Interactive interface to NCAR graphics p 3614 N93-29237

Remote vehicle survey tool [DE93-010822] p 3460 N93-29255

SPREE Interactive Data Analysis Tool (SIDAT) [AD-A262782] p 3273 N93-29306

Summer research program (1992). High School Apprenticeship Program (HSAP) reports. Volume 16: Arnold Engineering Development Center Civil Engineering Laboratory [AD-A262024] p 3608 N93-29396

Development of a visual system interface to support a domain-oriented application composition system [AD-A262489] p 3528 N93-29418

A virtual environment for manufacturing systems [AD-A263128] p 3528 N93-29473

Development of a new technique for image reconstruction, enhancement, and visualization [AD-A263145] p 3528 N93-29483

EnviroNET: On-line information for LDEF p 3624 N93-29625

Three-dimensional graphical representation of objects according to movement data in realtime [ESA-TT-1258] p 3521 N93-30104

An improved model-creation program for EM interaction analysis p 3367 N93-30294

Review of the effectiveness of video media in instruction [AD-A264228] p 3392 N93-30362

Introduction to the National Information Display Laboratory p 3628 N93-30718

Parcels with TAGS [PB93-181824] p 3535 N93-30824

Defining protein electrostatic recognition processes [AD-A264838] p 3571 N93-30901

A prototype of a faculty and staff executive information system [AD-A264852] p 3623 N93-30907

COMPUTER INFORMATION SECURITY

Minimum security requirements for multi-user operating systems [PB93-185999] p 3522 N93-30832

COMPUTER NETWORKS

Nets of reactive processes [INRIA-RR-1588] p 3537 N93-28505

Study on the concurrent calculation with a multitransputer network [DE93-753191] p 3524 N93-28531

National collaboratories: Applying information technology for scientific research [LC-93-83795] p 3612 N93-29129

RBSE: Product development team research activity deliverables [NASA-CR-193115] p 3527 N93-29212

A distributed system for visualizing and analyzing multivariate and multidisciplinary data p 3613 N93-29226

A comparison of high-speed links, their commercial support and ongoing R/D activities [DE93-008134] p 3382 N93-29245

Dynamic factorization in large-scale optimization [AD-A263993] p 3528 N93-29345

The parallel implementation of a backpropagation neural network and its applicability to SPECT image reconstruction [DE93-010304] p 3567 N93-29416

Data Multiplexing Network (DMN) equipment Operational Test and Evaluation (OT&E) integration test report
[AD-A263172] p 3538 N93-29490
Incorporation of varying types of temporal data in a neural network p 3518 N93-29575
NetStat: A probabilistic network connectivity analysis tool
[AD-A262838] p 3529 N93-29647
Advanced network technology: Background paper
[OTA-BP-TCT-101] p 3539 N93-29650
Communications neural net processors
[AD-A263330] p 3542 N93-29763
Storage systems for national information assets
[DE93-009303] p 3615 N93-29783
Ethernet performance of the Motorola Altair WIN system
[AD-A263877] p 3387 N93-29890
The planning coordinator: A design architecture for autonomous error recovery and on-line planning of intelligent tasks
[NASA-CR-193250] p 3543 N93-30039
Canadian Conference on Electrical and Computer Engineering, volumes 1 and 2
[ISBN-0-9694170-1-2] p 3354 N93-30215
Multiprocessing systems: Reliability modelling and analysis using multimode components and dependent failures
[AD-A264230] p 3540 N93-30364
Evolution of a high-performance storage system based on magnetic tape instrumentation recorders
p 3435 N93-30470
LANL High-Performance Data System (HPDS)
p 3622 N93-30478
Memory driven feature-based design
[AD-A264697] p 3534 N93-30495
High performance computing and communications program p 3627 N93-30715
Parcels with TAGS
[PB93-181824] p 3535 N93-30824
4D interconnect experimental development
[AD-A264298] p 3540 N93-30895

COMPUTER PROGRAMMING

Concurrent clean language manual, version 0.8
[TR-92-18] p 3522 N93-28482
Installation of a new Fortran compiler and effective programming method on the vector supercomputer
[DE93-753322] p 3524 N93-28537
Basic OSF/Motif programming and applications
[DE93-010800] p 3524 N93-28834
An assessment of space shuttle flight software development processes
[NASA-CR-193179] p 3525 N93-28934
Concept document of the repository-based software engineering program: A constructive appraisal
[NASA-CR-193125] p 3526 N93-29027
RBSE: Product development team research activity deliverables
[NASA-CR-193115] p 3527 N93-29212
Development of a visual system interface to support a domain-oriented application composition system
[AD-A262489] p 3528 N93-29418
A C++ interface for programming on the Connection Machine
[INRIA-RR-1698] p 3538 N93-29487
Using synthetic-perturbation techniques for tuning shared memory programs
[PB93-178572] p 3539 N93-29677
Electron transport calculations between 1 MeV and 1 eV
[AD-A263412] p 3568 N93-29787
NESL: A nested data-parallel language (Version 2.6)
[AD-A263548] p 3530 N93-29822
Capability maturity model for software, version 1.1
[AD-A263403] p 3530 N93-29852
ICASE
[NASA-CR-193257] p 3520 N93-29864
Automated modeling of physical systems
[NASA-CR-193256] p 3531 N93-29873
A guide to total software quality control, volume 1
[AD-A263881] p 3531 N93-29920
A guide to total software quality control, volume 2
[AD-A263891] p 3531 N93-29921
Key practices of the capability maturity model, version 1.1
[AD-A263432] p 3610 N93-29970
Estimating Ada system size during development
[AD-A263880] p 3532 N93-30022
Software testing using the IEEE standards
[DE93-009833] p 3532 N93-30050
Test structure to microcircuit correlation
[AD-A264157] p 3412 N93-30152
Canadian Conference on Electrical and Computer Engineering, volumes 1 and 2
[ISBN-0-9694170-1-2] p 3354 N93-30215
Proposal for a numerical array library
[DE93-010678] p 3623 N93-30482
The midway distributed shared memory system
[AD-A264645] p 3534 N93-30523
An approach to software quality prediction from Ada designs
[AD-A264731] p 3534 N93-30547
Nonsmooth optimization algorithms, system theory, and software tools
[AD-A264679] p 3534 N93-30549
Intelligent real-time problem solving
[AD-A264830] p 3535 N93-30614
Graphical programming: On-line robot simulation for telerobotic control
[DE93-009796] p 3447 N93-30654

COMPUTER PROGRAMS

The concurrent clean system user's manual and PABCstat user's manual, version 0.8
[TR-92-19] p 3523 N93-28484
High performance dispersion model PHYSIC
[DE93-753303] p 3467 N93-28536
Research in mathematics and computer science, March 1, 1991 - September 30, 1992
[DE93-011492] p 3509 N93-28573
Toward reusable graphics components in Ada
[AD-A262568] p 3524 N93-28577
BlockSolve v1.1: Scalable library software for the parallel solution of sparse linear systems
[DE93-011391] p 3524 N93-28644
The generic arithmetic of SISYPHE
[INRIA-RT-0136] p 3524 N93-28755
Solar flare MDH
[AD-A262275] p 3652 N93-28756
A modified Anderson Darling goodness-of-fit test for the gamma distribution with unknown scale and location parameters
[AD-A262486] p 3553 N93-28760
Implementation of a multidomain Navier-Stokes code on the Intel iPSC2 hypercube
[FFA-TN-1992-37] p 3418 N93-28994
Additional support for the TDK/MABL computer program
[NASA-CR-193037] p 3526 N93-29028
LDEF materials data bases
[NASA-TM-107757] p 3290 N93-29067
Parallel software tools at Langley Research Center
[NASA-TM-108995] p 3520 N93-29070
Ceramic matrix composites properties/microstresses with complete and partial interphase bond
[NASA-TM-106136] p 3297 N93-29071
The three-dimensional Multi-Block Advanced Grid Generation System (3DMAGGS)
[NASA-TM-108985] p 3420 N93-29155
Distributed Virtual System (DIVIRS) Project
[NASA-CR-193234] p 3526 N93-29169
Graphical interface between the CIRSSE testbed and CimStation software with MCS/CTOS
[NASA-CR-193276] p 3527 N93-29218
A planetary version of PC-McIDAS
p 3614 N93-29236
SWAT system performance predictions
[AD-A262857] p 3579 N93-29470
An analysis of the 70-meter antenna hydrostatic bearing by means of computer simulation p 3386 N93-29601
NetStat: A probabilistic network connectivity analysis tool
[AD-A262838] p 3529 N93-29647
Concept design example, Computer Aided Structural Modeling (CASM). Scheme A
[AD-A264759] p 3529 N93-29657
Concept design example, Computer Aided Structural Modeling (CASM). Scheme B
[AD-A264760] p 3529 N93-29658
Computer systems laboratory
[PB93-181873] p 3521 N93-29662
Using synthetic-perturbation techniques for tuning shared memory programs
[PB93-178572] p 3539 N93-29677
Data probe user's guide
[PB93-178655] p 3530 N93-29678
Key practices of the capability maturity model, version 1.1
[AD-A263432] p 3610 N93-29970
ARSRP signal processing software
[AD-A263543] p 3391 N93-29975
XRONOS: A timing analysis software package. User's guide, version 3.00
[NASA-TM-109222] p 3532 N93-30023
Assessment of Columbus payload operations capabilities by scheduling with the MARS system
[ESA-STR-235] p 3281 N93-30106
Test structure to microcircuit correlation
[AD-A264157] p 3412 N93-30152
On analytical performance modelling of software for distributed systems p 3364 N93-30279
Using Penelope to assess the correctness of NASA Ada software: A demonstration of formal methods as a counterpart to testing
[NASA-CR-4509] p 3533 N93-30380
SESAME equation of state number 8010: Boron loaded silicone potting material
[DE93-012083] p 3300 N93-30395
Oceanographic data processing program
[AD-A264801] p 3544 N93-30591
Acoustic-gravity waves from low-altitude localized disturbances
[AD-A264804] p 3479 N93-30593
Non-perturbative calculation of equilibrium polarization of stored electron beams
[DE93-764500] p 3577 N93-30607
Guide to Federal Water Quality Programs and Information: A Guide with Computer Software Developed by the Interagency Working Group on Water Quality
[PB93-186245] p 3475 N93-30834
Delaminations in composite plates under impact loads
p 3304 N93-30849
Software conception and structure of automated workstation for an experimental data processing
[DE93-609815] p 3623 N93-30994
Development of a PC code package for the analysis of research and power reactors
[DE92-638517] p 3536 N93-31001

COMPUTER STORAGE DEVICES

DOKMA: A document oriented communication model for medical applications as a basis of a role system in the medical field
[ETN-93-93799] p 3492 N93-28469
Structure and switching dynamics in ferroelectric crystal and liquid crystal thin films
[AD-A263664] p 3594 N93-29293
Associative memories for supercomputers
[AD-A263142] p 3520 N93-29482
Storage systems for national information assets
[DE93-009303] p 3615 N93-29783
Mass storage system reference model, Version 4
p 3617 N93-30450
The fundamentals and futures of removable mass storage alternatives p 3619 N93-30460
The NT digital micro tape recorder
p 3435 N93-30461
The state of the state of the art in mass storage technology p 3622 N93-30475
4D interconnect experimental development
[AD-A264298] p 3540 N93-30895

COMPUTER SYSTEMS DESIGN

Design of a hardware discrete event simulation coprocessor
[AD-A262614] p 3537 N93-28478
A multiarchitecture parallel-processing development environment
[NASA-TM-106180] p 3538 N93-28628
Spacecraft computer technology at Southwest Research Institute p 3522 N93-28813
A distributed object-oriented database application design
[AD-A262591] p 3612 N93-28846
LDEF materials data bases
[NASA-TM-107757] p 3290 N93-29067
Using today's technology to improve mobile C4I for the operational commander
[AD-A263613] p 3245 N93-29285
On analytical performance modelling of software for distributed systems p 3364 N93-30279
MLog: A language for prototyping concurrent systems
p 3368 N93-30301
Optimal trajectories for aircraft terrain following and terrain avoidance: A literature review update
[AD-A264075] p 3260 N93-30604
Multiprocessing MCNP on an IBM RS/6000 cluster
[DE93-008712] p 3540 N93-30633
Centralized maintenance evaluation
[AD-A264400] p 3544 N93-30886

COMPUTER SYSTEMS PERFORMANCE

Context switch time scalability: Benchmark results
[PB93-181832] p 3539 N93-29661
Accuracy enhancement in optical computing
[AD-A264872] p 3522 N93-30179

COMPUTER SYSTEMS PROGRAMS

A multiarchitecture parallel-processing development environment
[NASA-TM-106180] p 3538 N93-28628
RBSE: Product development team research activity deliverables
[NASA-CR-193115] p 3527 N93-29212
Applying high-level language paradigms to communications software for distributed systems
[AD-A263001] p 3528 N93-29463

COMPUTER TECHNIQUES

Godunov-type schemes applied to detonation flows
[NASA-CR-191447] p 3509 N93-28841

Computer assisted evaluation for air close combat based on time interval characterization p 3504 N93-28868

Flight evaluation of a computer aided low-altitude helicopter flight guidance system p 3260 N93-28869

Ceramic matrix composites properties/microstresses with complete and partial interphase bond [NASA-TM-106136] p 3297 N93-29071

Communications neural net processors [AD-A263330] p 3542 N93-29763

Capability maturity model for software, version 1.1 [AD-A263403] p 3530 N93-29852

Balanced technology initiative on computational mechanics of materials [AD-A263906] p 3453 N93-29863

ICASE [NASA-CR-193257] p 3520 N93-29864

Computer-controlled alignment for a 2000-line color monitor p 3247 N93-30324

Multiparticle imaging technique for two-phase fluid flows using pulsed laser speckle velocimetry [DE93-011734] p 3427 N93-30489

Computer algebra tools for higher symmetry analysis of nonlinear evolution equations [DE93-606089] p 3535 N93-30787

Computer assisted multiplex sequencing [DE93-007144] p 3536 N93-30934

An automated data collection system for a Charpy impact tester p 3293 N93-30972

COMPUTER VISION

Coarse image motion for saccade control [OUEL-1916/92] p 3523 N93-28485

Recognizing parameterized objects from range data [OUEL-1918/92] p 3523 N93-28486

Polygonal approximation overviews and perspectives [INRIA-RR-1621] p 3547 N93-28513

A modular head/eye platform for real-time reactive vision [OUEL-1941/92] p 3505 N93-28897

An autonomous vision-based mobile robot p 3443 N93-29082

A tutorial on exit pupils and eye rotation with virtual image optical displays [AD-A262399] p 3494 N93-29400

Representation and recognition with invariants and geometric constraint models [AD-A263235] p 3529 N93-29493

Automatic rule generation for high-level vision p 3511 N93-29526

Encoding spatial images: A fuzzy set theory approach p 3511 N93-29527

The fusion of information via fuzzy integration p 3517 N93-29568

Binocular spherical disparity: A study in representation for a forward translating camera [PB93-184422] p 3579 N93-29667

What is the center of the image? [AD-A263550] p 3579 N93-29824

An architecture for an analog VLSI neural network for early computer vision processing p 3359 N93-30244

Modelling and simulation of human retinal vision processing p 3363 N93-30269

Quantization effects in segmentation of range images p 3363 N93-30270

On the implementation of the BIRIS range sensor for applications in robotic control and autonomous navigation p 3366 N93-30286

Applications of digital 3-D imaging p 3366 N93-30287

Recognizing partially overlapping objects p 3366 N93-30289

Generalized octrees for constrained object modeling p 3369 N93-30304

Design and implementation of an interactive isochromatic fringe-analysis system using machine-vision techniques p 3369 N93-30305

Qualitative methods in computer vision [AD-A264335] p 3533 N93-30418

The 1991 neural information processing systems: Natural and synthetic [AD-A264754] p 3623 N93-30559

COMPUTERIZED SIMULATION

Rendering the out-the-window view for the AFIT virtual cockpit [AD-A262599] p 3260 N93-28467

High performance dispersion model PHYSIC [DE93-753303] p 3467 N93-28536

Advanced insulations for refrigerator/freezers: The potential for new shell designs incorporating polymer barrier construction [DE93-010600] p 3353 N93-28570

Probabilistic simulation of multi-scale composite behavior [NASA-TM-106196] p 3451 N93-28633

A grid refinement study of two-dimensional transient flow over a backward-facing step using a spectral-element method [DE92-018262] p 3417 N93-28639

Predicting radiation characteristics from antenna physical dimensions [AD-A262462] p 3379 N93-28654

Analysis for thermo-chemical decomposition of composite structures [NASA-CR-193185] p 3295 N93-28843

Neural network simulations on massively parallel computers: Applications in chemical physics [DE93-006739] p 3538 N93-28894

A proposed approach for developing next-generation computational electromagnetics software [DE93-007326] p 3380 N93-28900

Photodissociation of HBr/LiF(001): A quantum mechanical model [NASA-CR-193119] p 3603 N93-28933

Numerical simulation of quantum many-body systems [DE93-008300] p 3603 N93-28958

Computerized atmospheric trace contaminant control simulation for manned spacecraft [NASA-TM-108409] p 3505 N93-28977

Study on decreasing torque noise resulting from feedback noise for the modified bang-bang controller [AD-A263178] p 3407 N93-29010

Pre- and postprocessing techniques for determining goodness of computational meshes [NASA-CR-192553] p 3538 N93-29030

Large eddy simulations of shockwave passage through turbulence [DE92-019503] p 3419 N93-29050

Ceramic matrix composites properties/microstresses with complete and partial interphase bond [NASA-TM-106136] p 3297 N93-29071

Three-dimensional numerical simulation of gradual opening in a wave rotor passage [NASA-CR-191157] p 3252 N93-29072

Surface diffusion: Atomistics and surface morphology (summary of MRS Symposium B panel discussion) [DE93-009862] p 3594 N93-29188

Graphical interface between the CIRSSE testbed and CimStation software with MCS/CTOS [NASA-CR-193276] p 3527 N93-29218

Building a generalized distributed system model [NASA-CR-193239] p 3527 N93-29219

Computational simulations of a soft x ray projection lithography laser plasma source [DE93-009625] p 3437 N93-29264

On the value of function evaluation location information in Monte Carlo simulation [AD-A263662] p 3554 N93-29292

Fast multipole method in simulations of aqueous systems [AD-A263422] p 3567 N93-29336

MoCog1: A computer simulation of recognition-primed human decision making [NASA-TM-103868] p 3542 N93-29386

Experimental study of location and identification of ferrous spheroids using a smart total field magnetometer [AD-A263661] p 3324 N93-29391

A real-time, hardware-in-the-loop simulation of an unmanned aerial research vehicle [AD-A262477] p 3248 N93-29409

Estimating the parameters of chaotic maps [AD-A262574] p 3556 N93-29423

A virtual environment for manufacturing systems [AD-A263128] p 3528 N93-29473

An analysis of the 70-meter antenna hydrostatic bearing by means of computer simulation p 3386 N93-29601

Special purpose parallel computer architecture for real-time control and simulation in robotic applications [NASA-CASE-NPO-17629-1-CU] p 3521 N93-29608

LDEF microenvironments, observed and predicted p 3283 N93-29623

RTE: A UNIX library with on-line documentation and sample programs for microwave radiative transfer calculations [PB93-180248] p 3386 N93-29680

Electron transport calculations between 1 MeV and 1 eV [AD-A263412] p 3568 N93-29787

Two simulation studies of precision runway monitoring of independent approaches to closely spaced parallel runways [AD-A263433] p 3261 N93-29815

A search for radiative neutrino decay from supernovae [NASA-CR-193118] p 3653 N93-30052

Molecular dynamics of detonation in crystals with defects p 3350 N93-30097

Shock waves and polymorphic phase transitions in energetic materials p 3351 N93-30100

Three-dimensional graphical representation of objects according to movement data in realtime [ESA-TT-1258] p 3521 N93-30104

Simulation of landscape disturbances and the effect of climatic change [DE93-011615] p 3472 N93-30131

Annual report on monitoring of the unsaturated zone and recharge areas at INEL to the state of Idaho INLEL oversight committee [DE93-012947] p 3473 N93-30187

Analysis and simulation of a two degrees-of-freedom one-link flexible forearm p 3361 N93-30261

Modelling and simulation of human retinal vision processing p 3363 N93-30269

Coupling gain computation between antennas on circular cylinders at SHF/EHF frequencies p 3369 N93-30309

National Airspace System Performance Analysis Capability (NASPAC) simulation model p 3247 N93-30351

Procedural development prototype in Automated En Route Air Traffic Control p 3247 N93-30352

Parallel processing and learning: Variability and chaos in self-organization of activity in groups of neurons [AD-A264224] p 3539 N93-30361

Computational analysis of slip in PETN [DE92-040222] p 3598 N93-30445

The calculation of electrostatic interactions and their role in determining the energies and geometries of molecular HE crystals [DE92-040374] p 3570 N93-30448

A computer simulation of the production of an artificially ionized layer using the Arecibo facility [DE93-010817] p 3478 N93-30487

Development of a CFD code for casting simulation [NASA-CR-192577] p 3427 N93-30492

Analysis and computation for vortex dynamics and rarefied gases [AD-A264705] p 3427 N93-30499

Simulation and calculation of diffusive aerosol deposition [DE93-007518] p 3474 N93-30506

Adaptive airborne radar simulation with equalization filter taps [AD-A264722] p 3393 N93-30514

The structure and dynamics of the vorticity and passive scalar fields at small scales in homogeneous isotropic turbulence p 3427 N93-30625

Radiation effects in FCC metals and intermetallic compounds: A molecular dynamics computer simulation study [DE93-009546] p 3600 N93-30668

Validation and upgrading of physically based mathematical models p 3237 N93-30688

On the impossibility of creating the quantum correlations with computers [DE93-606039] p 3606 N93-30806

Vehicle dynamic stability and rollover [PB93-185437] p 3447 N93-30828

Environmental characteristics of EPA, NRC, and DOE sites contaminated with radioactive substances [PB93-185551] p 3475 N93-30829

Probabilistic composite analysis p 3307 N93-30868

Adaptive motion control of mobile robots p 3545 N93-30903

COMPUTERS

Computer systems laboratory [PB93-181873] p 3521 N93-29662

High performance computing: Advanced Research Projects Agency should do more to foster program goals. Report to the Chairman, Committee on Armed Services, House of Representatives [GAO/IMTEC-93-24] p 3533 N93-30202

CONCENTRATION (COMPOSITION)

In-situ temperature and concentration measurements of organosilicon decomposition in a chemical vapor deposition reactor [ONERA-P-1990-3] p 3313 N93-30109

CONCENTRATORS

Modification of flux profiles using a faceted concentrator [DE93-000087] p 3464 N93-29925

CONCRETE STRUCTURES

Sensor systems for monitoring Maglev guideway structures [PB93-154821] p 3444 N93-29205

CONCURRENT PROCESSING

Concurrent clean language manual, version 0.8 [TR-92-18] p 3522 N93-28482

The concurrent clean system user's manual and PABCstat user's manual, version 0.8 [TR-92-19] p 3523 N93-28484

Study on the concurrent calculation with a multitransputer network [DE93-753191] p 3524 N93-28531

Context switch time scalability: Benchmark results [PB93-181832] p 3539 N93-29661

MLog: A language for prototyping concurrent systems p 3368 N93-30301

CONDENSATION NUCLEI
Clouds and radiation: A primer
[AD-A263136] p 3482 N93-29479
Quantifying and minimizing uncertainty of climate forcing by anthropogenic aerosols
[NASA-TM-108259] p 3472 N93-30043
CONDENSED MATTER PHYSICS
The investigation of nonlinear effects on quasiparticle transport in condensed matter systems
[DE93-009582] p 3565 N93-28914
The 26th International Quantum Chemistry Symposium on Atomic, Molecular, and Condensed Matter Theory and Computational Methods
[AD-A264206] p 3315 N93-30534
CONDENSERS (LIQUEFIERS)
Pulse mitigation and heat transfer enhancement techniques. Volume 4: Transient behavior of heat pipe with thermal energy storage under pulse heat loads
[AD-A263497] p 3423 N93-29339
CONDENSING
Materials studies for preventing corrosion in condensing environments
[PB93-185478] p 3327 N93-30815
CONDUCTING POLYMERS
Synthesis of conducting polymer composite fibers in electrochemical flow cells
[AD-A262233] p 3294 N93-28492
Polymers with electrical and nonlinear optical properties
[AD-D015691] p 3333 N93-29457
Method of continuously determining crack length
[NASA-CASE-LAR-14480-1-CU] p 3452 N93-29612
Synthesis and properties of a cation-conducting, high temperature polymer electrolyte
[AD-A263557] p 3334 N93-29825
Triplet states and optical absorptions in finite polyenes and conjugated polymers
[AD-A264552] p 3337 N93-30381
Optically switchable conductive polymers
[AD-A264751] p 3337 N93-30557
Ultrafast, passive, broad-band, optical shutter based on novel semiconductor/conducting polymer interfaces
[AD-A264098] p 3601 N93-30878
CONDUCTION BANDS
A tight binding model for the electronic structure of FCC and SC C60
[DE93-606214] p 3601 N93-30794
CONDUCTION ELECTRONS
A possibility to investigate the superconducting gap with the help of neutrons
[DE93-606392] p 3601 N93-30799
CONDUCTIVE HEAT TRANSFER
Derivation of conductive heat transfer in mountains from AVHRR data p 3458 N93-28927
Pulse mitigation and heat transfer enhancement techniques. Volume 4: Transient behavior of heat pipe with thermal energy storage under pulse heat loads
[AD-A263497] p 3423 N93-29339
Modelling thermal behaviour of turbomachinery discs and casings p 3256 N93-29949
On the ideality of using a step-function current in a metallic foil to simulate a step-function heat-flux source
[AD-A264627] p 3413 N93-30539
CONDUCTORS
New III-V cell design approaches for very high efficiency
[DE93-000097] p 3464 N93-28971
Adhesion of thick film Au to alumina ceramics
[DE93-009802] p 3339 N93-30656
Some problems of relativistic electrodynamics
[DE92-644738] p 3400 N93-30923
CONFERENCES
Proceedings of the Near-Earth-Object Interception Workshop
[NASA-TM-108236] p 3556 N93-28572
International Conference on Martensitic Transformations (ICOMAT 92)
[AD-A262739] p 3321 N93-28591
NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings
[NASA-TM-108721] p 3262 N93-28699
Workshop on Advanced Technologies for Planetary Instruments, part 1
[NASA-CR-193015] p 3639 N93-28764
Proceedings of a Workshop on Molecular Nuclear Medicine
[DE93-010828] p 3493 N93-28835
Combat Automation for Airborne Weapon Systems: Man/Machine Interface Trends and Technologies
[AGARD-CP-520] p 3501 N93-28850
Proceedings of the Second Atmospheric Radiation Measurement (ARM) Science Team Meeting
[DE93-005886] p 3476 N93-28889
Introductions to the Proceedings of the Fourteenth Symposium on Biotechnology for Fuels and Chemicals
[DE93-006235] p 3490 N93-28890
FNAS CRRES program completion
[NASA-CR-192468] p 3476 N93-29032
Contributions to the American Meteorological Society's 26th International Conference on Radar Meteorology
[AD-A263385] p 3481 N93-29257
Low temperature (LT) GaAs and related materials
[AD-A263607] p 3298 N93-29282
FAA international conference on airplane ground deicing
[AD-A263617] p 3244 N93-29286
Proceedings of the 25th European Conference on the Application of Polar Dielectrics to celebrate the 25th anniversary of the Dielectric Society, incorporating the 1st International Workshop on Integrated Ferroelectrics
[AD-A263427] p 3332 N93-29337
LDEF: 69 Months in Space. Second Post-Retrieval Symposium, part 2
[NASA-CP-3194-PT-2] p 3654 N93-29354
Symposium on high temperature superconductors: Materials research for emerging technologies
[AD-A263120] p 3409 N93-29495
North American Fuzzy Logic Processing Society (NAFIPS 1992), volume 1
[NASA-CP-10112-VOL-1] p 3509 N93-29516
North American Fuzzy Logic Processing Society (NAFIPS 1992), volume 2
[NASA-CP-10112-VOL-2] p 3515 N93-29556
LDEF: 69 Months in Space. Part 1: Second Post-Retrieval Symposium
[NASA-CP-3194-PT-1] p 3660 N93-29621
The 17th Annual Climate Diagnostics Workshop
[PB93-183895] p 3483 N93-29664
The 9th FLICC Forum on Federal Information Policies
[PB93-184687] p 3624 N93-29668
LDEF: 69 Months in Space. Part 4: Second Post-Retrieval Symposium
[NASA-CP-3194-PT-4] p 3665 N93-29682
Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program
[NASA-CR-192962] p 3227 N93-29712
T(lc2)acS(lc3)ats for Surveillance Verification and C3I
[AGARD-CP-522] p 3387 N93-29892
Heat Transfer and Cooling in Gas Turbines
[AGARD-CP-527] p 3252 N93-29926
Proceedings of Symposium F on New Aspects on the Growth, Characterization and Applications of CdTe and related Cd rich alloys 5, 1992
[AD-A263541] p 3597 N93-29974
Solar world congress: Proceedings of the biennial congress of the international solar energy society, volume 1, part 2
[PB93-174779] p 3465 N93-30001
ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials
[CPIA-PUBL-589] p 3343 N93-30061
The IUTAM Symposium on Breaking Waves
[AD-A264196] p 3489 N93-30143
The 1992 World Administrative Radio Conference: Technology and Policy Implications
[OTA-TCT-549] p 3392 N93-30150
Canadian Conference on Electrical and Computer Engineering, volumes 1 and 2
[ISBN-0-9694170-1-2] p 3354 N93-30215
The First NASA Advanced Composites Technology Conference, part 1
[NASA-CP-3104-PT-1] p 3300 N93-30428
Topical meeting of broadband analog and digital optoelectronics
[AD-A264643] p 3581 N93-30522
The 26th International Quantum Chemistry Symposium on Atomic, Molecular, and Condensed Matter Theory and Computational Methods
[AD-A264206] p 3315 N93-30534
Cloud Impacts on DOD Operations and Systems Conference (CIDOS-91)
[AD-A264463] p 3484 N93-30535
The 1991 neural information processing systems: Natural and synthetic
[AD-A264754] p 3623 N93-30559
Technology Transfer and the Civil Space Program. Volume 2: Workshop proceedings
[NASA-TM-108250] p 3625 N93-30692
ELF/VLF/LF Radio Propagation and Systems Aspects
[AGARD-CP-529] p 3394 N93-30727
Introduction p 3395 N93-30728
Plasma Physics Network Newsletter, no. 5
[DE93-606216] p 3591 N93-30795
Gordon Research Conferences, 1991
[AD-A264275] p 3317 N93-30816
Proceedings of the meeting of the Intergovernmental US-Russian Business Development Committee's Standards Working Group
[PB93-179968] p 3610 N93-30822
First NASA Advanced Composites Technology Conference, part 2
[NASA-CP-3104-PT-2] p 3303 N93-30841
Solar World Congress: Proceedings of the Biennial Congress of the International Solar Energy Society, volume 2, part 2
[PB93-174795] p 3466 N93-30935
Advanced electromagnetic methods for aerospace vehicles
[NASA-CR-193468] p 3400 N93-31036
CONFIGURATION INTERACTION
Theoretical hyperfine structure constants for transition metal atoms and ions
[DE93-012325] p 3566 N93-29183
Applications of density functional theory to calculation of reaction energetics p 3351 N93-30098
Rate constant determinations of reactions H + HNO from ab initio reaction path calculations
p 3319 N93-30099
CONFINEMENT
A numerical study of confined turbulent jets
[NASA-TM-106197] p 3420 N93-29161
Optimization for steady-state and hybrid operations of ITER by using scaling models of divertor heat load
[DE93-764151] p 3590 N93-30649
CONFORMAL MAPPING
Understanding conformal field theory through parafermions and Chern Simons theory
[DE93-010452] p 3604 N93-29806
Positive energy representations of the conformal quantum algebra
[DE93-606064] p 3551 N93-30809
Superconformal structures and holomorphic 1/2-superdifferentials on N = 1 super Riemann surfaces
[DE93-604133] p 3558 N93-30989
CONGRESSIONAL REPORTS
Tropical forests and biological diversity: USAID report to Congress 1990-1991
[PB93-180453] p 3471 N93-29681
High performance computing: Advanced Research Projects Agency should do more to foster program goals. Report to the Chairman, Committee on Armed Services, House of Representatives
[GAO/IMTEC-93-24] p 3533 N93-30202
Promoting high-performance computing and communications
[ISBN-0-16-041828-3] p 3522 N93-30570
CONGRUENCES
Algorithms for point set congruence
[AD-A264016] p 3532 N93-29980
CONIFERS
Generation of carbon monoxide in compartment fires
[PB93-146702] p 3244 N93-29211
Modeling the bidirectional reflectance and spectra
[AD-A263570] p 3462 N93-29830
CONJUGATE GRADIENT METHOD
A conjugate gradients/trust regions algorithms for training multilayer perceptrons for nonlinear mapping
p 3519 N93-29581
CONJUGATION
Conjugated substituted ionic polyacetylenes
[AD-A264702] p 3337 N93-30497
CONNECTION MACHINE
Neural network simulations on massively parallel computers: Applications in chemical physics
[DE93-006739] p 3538 N93-28894
A C++ interface for programming on the Connection Machine
[INRIA-RR-1698] p 3538 N93-29487
Multiresolution analysis of SAR data
[AD-A264727] p 3393 N93-30576
CONNECTIVE TISSUE
Wound healing and connective tissue metabolism: The role of hyperbaric oxygen therapy
[AD-A262483] p 3493 N93-28759
CONNECTORS
Leaky coaxial cable signal transmission for remote facilities
[DE93-007916] p 3383 N93-29348
Quick connect fastener
[NASA-CASE-MFS-28833-1] p 3445 N93-29846
Optimal geometric design of robots for environments with obstacles p 3445 N93-30149
CONSERVATION
Building alliances to restore coastal environments: A coastal America progress report
[PB93-169464] p 3470 N93-29674
Tropical forests and biological diversity: USAID report to Congress 1990-1991
[PB93-180453] p 3471 N93-29681
CONSERVATION LAWS
A new flux conserving Newton's method scheme for the two-dimensional, steady Navier-Stokes equations
[NASA-TM-106160] p 3416 N93-28626
Nonlinear stability of viscous shock waves
[TRITA-NA-9205] p 3419 N93-29025

Integrals of motion on the group of invariance of an interval in three-dimensional spaces [DE93-606090] p 3606 N93-30797

CONSOLIDATION

Explosive consolidation of combustion synthesized TiC and TiB2: Precursor morphology effects [AD-A263186] p 3341 N93-28515

Consolidation of graphite thermoplastic textile preforms for primary aircraft structure p 3302 N93-30439

CONSTANTS

Rate constant determinations of reactions H + HNO from ab initio reaction path calculations p 3319 N93-30099

CONSTITUTIVE EQUATIONS

Constitutive laws for deformation and dynamic recrystallization in cubic metals [DE93-010740] p 3326 N93-30486

CONSTRUCTION

Measurement of a Michelson interferometer mirror velocity with a time interval analyzer [AD-A263009] p 3430 N93-28659

Lightweight flexible composite tent materials [AD-A263021] p 3295 N93-28660

Space construction activities [NASA-CR-192690] p 3274 N93-29108

Interaction dynamics of on-orbit construction p 3274 N93-29109

Hybrid CMS methods with model reduction for assembly of structures p 3274 N93-29110

Structural load control during construction p 3275 N93-29113

Systems engineering studies of on-orbit assembly operation p 3275 N93-29114

Lunar regolith densification p 3276 N93-29115

Lunar rovers and local positioning system p 3277 N93-29119

Systems engineering studies of lunar base construction p 3277 N93-29121

Advanced Construction Technology Center research [AD-A263654] p 3432 N93-29390

Construction and testing of simple airfoils to demonstrate structural design, materials choice, and composite concepts p 3243 N93-30979

CONSTRUCTION MATERIALS

Indigenous lunar construction materials p 3277 N93-29120

Systems engineering studies of lunar base construction p 3277 N93-29121

CONSUMERS

An experimental methodology for a fuzzy set preference model p 3514 N93-29547

A fuzzy set preference model for market share analysis p 3514 N93-29548

Evaluation of environmental marketing terms in the United States [PB93-175784] p 3474 N93-30660

CONTAINERS

Solving a product safety problem using a recycled high density polyethylene container p 3292 N93-30964

CONTAINMENT

Advanced collapsible tank for liquid containment [NASA-CR-188247] p 3353 N93-28698

Containment of explosions in spherical vessels [DE93-005445] p 3446 N93-30211

CONTAMINANTS

State of the art: Ecological biomarkers [DE93-006621] p 3469 N93-28992

Study to determine the nature and extent of ozone and ozone precursor transport in selected areas of California [PB93-184828] p 3470 N93-29669

Annual report on monitoring of the unsaturated zone and recharge areas at INEL to the state of Idaho INLEL oversight committee [DE93-012947] p 3473 N93-30187

An evaluation of factors affecting the solidification/stabilization of heavy metal sludge [AD-A264128] p 3473 N93-30197

Development of novel models for describing multiple toxicity effects [AD-A264439] p 3496 N93-30422

Guide to Federal Water Quality Programs and Information: A Guide with Computer Software Developed by the Interagency Working Group on Water Quality [PB93-186245] p 3475 N93-30834

CONTAMINATION

Environmental monitors in the Midcourse Space Experiments (MSX) p 3286 N93-28826

Post-flight analyses of the crystals from the M0003-14 quartz crystal microbalance experiment p 3602 N93-29684

Annual report on monitoring of the unsaturated zone and recharge areas at INEL to the state of Idaho INLEL oversight committee [DE93-012947] p 3473 N93-30187

Contamination of soil, soil gas, and ground water by hydrocarbon compounds near Greear, Morgan County, Kentucky [PB93-182244] p 3474 N93-30825

Environmental characteristics of EPA, NRC, and DOE sites contaminated with radioactive substances [PB93-185551] p 3475 N93-30829

CONTINENTAL SHELVES

A water mass analysis of the 1991-1992 El Nino signal in the Farallon Islands region [AD-A263490] p 3488 N93-29819

CONTINUITY (MATHEMATICS)

Comparison of analytical transport and stochastic solutions for neutron slowing down in an infinite medium [DE93-010799] p 3565 N93-28833

CONTINUOUS RADIATION

Development of a 9.3 micrometer CW LIDAR for the study of atmospheric aerosol [NASA-CR-193227] p 3381 N93-29105

The 2-6 semiconductor superlattices [AD-A264343] p 3597 N93-30164

CONTINUOUS WAVE LASERS

Tunable CW diode-pumped Tm,Ho:YLiF4 laser operating at or near room temperature [NASA-CASE-NPO-18611-1-CU] p 3440 N93-30415

Efficient laser action from two CW laser pumped pyrromethene-BF2 complexes [AD-A264887] p 3441 N93-30910

CONTINUOUS WAVE RADAR

Development of an airborne MMW FM-CW radar for mapping river ice [AD-A262655] p 3379 N93-28588

CONTINUUM MECHANICS

A continuum code investigation of stress integration using exact and approximate material rotation [DE93-001892] p 3454 N93-31013

CONTINUUM MODELING

A one-dimensional continuum model for shape-memory alloys [AD-A262505] p 3321 N93-28656

Progressive failure methodologies for predicting residual strength and life of laminated composites p 3307 N93-30866

CONTINUUMS

Coherent and semi-coherent neutron transfer reactions [DE93-008336] p 3565 N93-28959

Chemical dynamics simulations as a probe to the initiation and propagation of condensed phase detonations p 3318 N93-30071

CONTOURS

Methods for characterizing the human head for the design of helmets [AD-A263875] p 3507 N93-29889

Detecting residue on a printed circuit board: An application of the Boundary Contour/Feature Contour System [DE93-006283] p 3412 N93-30370

CONTRACT MANAGEMENT

The program manager's notebook [AD-A263074] p 3609 N93-29142

The identification of early warning signals prior to contractor default [AD-A262828] p 3609 N93-29433

CONTRACTION

Nth roots of normal contractions [DE92-644725] p 3557 N93-30985

CONTRACTORS

The identification of early warning signals prior to contractor default [AD-A262828] p 3609 N93-29433

Technology transfer and Rockwell International p 3627 N93-30712

CONTRACTS

How to compete for NASA contracts [NASA-TM-109238] p 3610 N93-30644

CONTROL EQUIPMENT

Sources sought for innovative scientific instrumentation for scientific lunar rovers p 3434 N93-28804

Strategic avionics technology definition studies. Subtask 3-1A: Electrical Actuation (ELA) systems [NASA-CR-193237] p 3271 N93-29215

Articulated fin/wing control system [AD-D015712] p 3259 N93-29278

Intelligent fuzzy controller for event-driven real time systems p 3515 N93-29551

Siphon breaker design requirements [DE93-011799] p 3425 N93-30132

CONTROL SIMULATION

Virtual interface applications for airborne weapons systems p 3502 N93-28858

Computerized atmospheric trace contaminant control simulation for manned spacecraft [NASA-TM-108409] p 3505 N93-28977

Building a generalized distributed system model [NASA-CR-193239] p 3527 N93-29219

A numerical simulator for testing sliding mode controls in stochastic systems p 3361 N93-30260

CONTROL STABILITY

Robust feedforward/feedback control synthesis for uncertain dynamical systems p 3542 N93-29079

Hybrid CMS methods with model reduction for assembly of structures p 3274 N93-29110

Controls for space structures p 3275 N93-29112

Some results on feedback stabilization of a one-link flexible arm [INRIA-RR-1682] p 3543 N93-30116

Robust control via H-infinity optimization p 3354 N93-30216

CONTROL SURFACES

Articulated fin/wing control system [AD-D015712] p 3259 N93-29278

CONTROL SYSTEMS DESIGN

NASA instep/MDMSC jitter suppression experiment (JITTER) p 3263 N93-28702

Control-structures interaction test of the LACE satellite p 3263 N93-28706

CSI-Star: A low-cost CSI orbital testbed p 3263 N93-28707

Multivariable control of the Space Shuttle Remote Manipulator System using linearization by state feedback [NASA-CR-188248] p 3443 N93-29080

Three-parameter tunable Tilt-Integral-Derivative (TID) controller [NASA-CASE-NPO-18492-1-CU] p 3542 N93-29176

Optically controlled active impedance element particularly suited for a microwave oscillator [AD-D015723] p 3408 N93-29281

A self-learning rule base for command following in dynamical systems p 3512 N93-29531

Evaluation of fuzzy inference systems using fuzzy least squares p 3513 N93-29539

The cognitive bases for the design of a new class of fuzzy logic controllers: The clearness transformation fuzzy logic controller p 3515 N93-29554

A fuzzy control design case: The fuzzy PLL p 3515 N93-29555

Genetic algorithms in adaptive fuzzy control p 3518 N93-29572

Automation of closed environments in space for human comfort and safety p 3230 N93-29734

Attitude- and Orbit Control Subsystem concepts for TACSATS p 3284 N93-29906

Control of nonlinear systems with applications to constrained robots and spacecraft attitude stabilization p 3279 N93-29989

Input relegation control for gross motion of a kinematically redundant manipulator [DE93-005301] p 3446 N93-30210

Control system design and multiparameter variations p 3355 N93-30217

Optimal filtering and LQR theory with constraints on system and control matrices p 3357 N93-30234

An adaptive controller for a class of MIMO non-minimum phase systems with disturbance rejection design p 3359 N93-30248

Noise transmission properties and control strategies for composite structures p 3301 N93-30436

Flight control system design factors for applying automated testing techniques [NASA-TM-4242] p 3260 N93-30764

Control of nonlinear systems with applications to constrained robots and spacecraft attitude stabilization p 3544 N93-30893

CONTROL THEORY

Resource limited reasoning: A study of literature in the context of model-based diagnosis [MEMO-INF-92-38] p 3540 N93-28480

Artificial intelligence methodologies in flight related differential game, control and optimization problems [AD-A262405] p 3541 N93-28498

The dynamics and control of space tethers p 3274 N93-28629

Stabilization using low-gain PI control: SISO case [OUEL-1947/92] p 3541 N93-28898

JPRS report: Science and technology. Central Eurasia: Physics and mathematics [JPRS-UPM-93-002] p 3560 N93-29022

Mathematical modeling and control law development for the atmospheric monitoring and control system of the Controlled Environment Research Chamber (CERC) at NASA Ames Research Center [AD-A261978] p 3261 N93-29436

Design issues of a reinforcement-based self-learning fuzzy controller for petrochemical process control p 3512 N93-29533

Fuzzy coordinator in control problems p 3515 N93-29552

Tuning a fuzzy controller using quadratic response surfaces p 3515 N93-29553

The cognitive bases for the design of a new class of fuzzy logic controllers: The clearness transformation fuzzy logic controller p 3515 N93-29554
A fuzzy control design case: The fuzzy PLL p 3515 N93-29555
Some problems with the design of self-learning management systems p 3516 N93-29559
A neural fuzzy controller learning by fuzzy error propagation p 3516 N93-29560
Center for the Study of Intelligent Control Systems (Fellowships) [AD-A263604] p 3543 N93-29917
Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads [NASA-CR-193142] p 3279 N93-29988
Optimal filtering and LQR theory with constraints on system and control matrices p 3357 N93-30234
Turbulent drag reduction: Studies of feedback control and flow over riblets p 3242 N93-30645

CONTROL VALVES
Magnetically operated check valve [NASA-CASE-MSC-22046-1] p 3442 N93-28501
Inservice diagnostic methods for solenoid-operated valves [DE93-007823] p 3443 N93-28968

CONTROLLABILITY
Structural load control during construction p 3275 N93-29113

CONTROLLED ATMOSPHERES
Mathematical modeling and control law development for the atmospheric monitoring and control system of the Controlled Environment Research Chamber (CERC) at NASA Ames Research Center [AD-A261978] p 3261 N93-29436

CONTROLLED FUSION
JT-60 Upgrade vertical stability experiments and analysis [DE93-753131] p 3583 N93-28530
Measurements of breakaway reaction between beryllium and water vapor for ITER blanket design [DE93-753270] p 3584 N93-28535
Effects of neutral gas collisions on the power transmission factor at the divertor sheath [DE93-009320] p 3588 N93-29334
Optimization for steady-state and hybrid operations of ITER by using scaling models of divertor heat load [DE93-764151] p 3590 N93-30649
Plasma Physics Network Newsletter, no. 5 [DE93-606216] p 3591 N93-30795

CONTROLLERS
Clementine sensor processing system p 3285 N93-28778
A modular head/eye platform for real-time reactive vision [OUEL-1941/92] p 3505 N93-28897
Study on decreasing torque noise resulting from feedback noise for the modified bang-bang controller [AD-A263178] p 3407 N93-29010
Three-parameter tunable Tilt-Integral-Derivative (TID) controller [NASA-CASE-NPO-18492-1-CU] p 3542 N93-29176
A composite self tuning strategy for fuzzy control of dynamic systems p 3511 N93-29530
Design issues of a reinforcement-based self-learning fuzzy controller for petrochemical process control p 3512 N93-29533
WARP: Weight Associative Rule Processor. A dedicated VLSI fuzzy logic megacell p 3513 N93-29538
Intelligent fuzzy controller for event-driven real time systems p 3515 N93-29551
Fuzzy coordinator in control problems p 3515 N93-29552
Tuning a fuzzy controller using quadratic response surfaces p 3515 N93-29553
The cognitive bases for the design of a new class of fuzzy logic controllers: The clearness transformation fuzzy logic controller p 3515 N93-29554
A fuzzy control design case: The fuzzy PLL p 3515 N93-29555
A neural fuzzy controller learning by fuzzy error propagation p 3516 N93-29560
Comparison between the performance of two classes of fuzzy controllers p 3517 N93-29566
Genetic algorithms in adaptive fuzzy control p 3518 N93-29572
A genetic algorithms approach for altering the membership functions in fuzzy logic controllers p 3518 N93-29573
Hierarchical model of matching p 3519 N93-29580
Acoustic charge transport technology investigation for advanced development transponder p 3386 N93-29602
Robust control of intelligent rotor [AD-A263707] p 3259 N93-29985
Dynamics and robust control of sampled data systems for large space structures [AD-A264192] p 3281 N93-30142
An adaptive controller for a class of MIMO non-minimum phase systems with disturbance rejection design p 3359 N93-30248
Robust boundary control of flexible structures governed by hybrid dynamics p 3285 N93-30249
A numerical simulator for testing sliding mode controls in stochastic systems p 3361 N93-30260
Task allocation and real-time considerations for the Robot Controller Test Station (RCTS) p 3364 N93-30278
Analysis of cache for streaming tape drive p 3435 N93-30477

CONVECTION
Prognostic cloud water in the Los Alamos general circulation model [DE93-007381] p 3482 N93-29347
Convective and stratiform rain: Multichannel microwave sensing over oceans [NASA-TM-104586] p 3482 N93-29448
An upwind method for the solution of the 3D Euler and Navier-Stokes equations on adaptively refined meshes [AD-A262863] p 3423 N93-29472
Vertical slot convection: A linear study [DE93-007643] p 3423 N93-29804
Observing and modelling F-region ionospheric dynamics using the OII 7320A emission p 3479 N93-30564

CONVECTION CURRENTS
The Mechanisms of Solar Variability (MSV) program [AD-A262525] p 3652 N93-28585

CONVECTIVE FLOW
A numerical study of confined turbulent jets [NASA-TM-106197] p 3420 N93-29161

CONVECTIVE HEAT TRANSFER
Spherically symmetric model atmospheres for late-type giant stars [ISBN-0-315-72632-6] p 3633 N93-28673
Thermal certification tests of Orbiter Thermal Protection System tiles coated with KSC coating slurries [NASA-TM-104766] p 3278 N93-29221
Thermal effects of a coolant film along the suction side of a high pressure turbine nozzle guide vane p 3253 N93-29930
Modelling thermal behaviour of turbomachinery discs and casings p 3256 N93-29949
Analytical and experimental study of laminar free convective heat transfer from isothermal convex bodies of arbitrary shape [ISBN-0-315-72512-5] p 3426 N93-30379
Performance of thermal adhesives in forced convection p 3293 N93-30974
High thermal conductivity of diamond p 3294 N93-30977

CONVERGENCE
Nonlinear relaxation algorithms for the compressible Navier-Stokes equations in two and three dimensions p 3421 N93-29177
A conjugate gradients/trust regions algorithms for training multilayer perceptrons for nonlinear mapping p 3519 N93-29581
Enhanced convergence adaptive detection [AD-A264100] p 3399 N93-30879

CONVERGENT NOZZLES
Performance characteristics of two multiaxis thrust-vectoring nozzles at Mach numbers up to 1.28 [NASA-TP-3313] p 3239 N93-29160

CONVERGENT-DIVERGENT NOZZLES
Cooling predictions in turbofan engine components p 3259 N93-29964

CONVOLUTION INTEGRALS
The general theory of convolutional codes p 3385 N93-29595

COOLANTS
Thermal effects of a coolant film along the suction side of a high pressure turbine nozzle guide vane p 3253 N93-29930

COOLERS
Spaceborne passive radiative cooler p 3378 N93-28802
Study of parameters affecting the performance of solar desiccant cooling systems [DE93-000088] p 3465 N93-30206

COOLING
The microchannel heatsink with liquid nitrogen cooling [DE93-009258] p 3422 N93-29300
Pulse mitigation and heat transfer enhancement techniques. Volume 1: Spray cooling [AD-A263495] p 3423 N93-29352
Semiconductor cooling apparatus [NASA-CASE-LEW-14162-3] p 3299 N93-29614
Heat Transfer and Cooling in Gas Turbines [AGARD-CP-527] p 3252 N93-29926
Turbulent flow and heat transfer in idealized blade cooling passages p 3254 N93-29938
Cooling geometry optimization using liquid crystal technique p 3254 N93-29939
Fundamental studies of impingement cooling thermal boundary conditions p 3254 N93-29940
Prediction of jet impingement cooling scheme characteristics (airfoil leading edge application) p 3255 N93-29941
An L2F-measurement device with image rotator prism for flow velocity analysis in rotating coolant channels p 3255 N93-29942
Local heat transfer measurement with liquid crystals on rotating surfaces including non-axisymmetric cases p 3255 N93-29943
Study of parameters affecting the performance of solar desiccant cooling systems [DE93-000088] p 3465 N93-30206
Complex-compound heat pump: Topical report on phase 1 results [PB93-185460] p 3466 N93-30814
Performance of thermal adhesives in forced convection p 3293 N93-30974

COOLING SYSTEMS
Inservice diagnostic methods for solenoid-operated valves [DE93-007823] p 3443 N93-28968
Reliability assessment of thrust chamber cooling concepts using probabilistic analysis techniques [NASA-CR-190785] p 3288 N93-29068
Evaluation of personal cooling systems in conjunction with explosive ordnance disposal suits [AD-A262862] p 3506 N93-29471
The effect of orthogonal-mode rotation on forced convection in a circular-sectioned tube fitted with full circumferential transverse ribs p 3254 N93-29937
The effect of main stream flow angle on flame tube film cooling p 3257 N93-29953
Impingement/effusion cooling p 3257 N93-29954
Study of parameters affecting the performance of solar desiccant cooling systems [DE93-000088] p 3465 N93-30206

COORDINATION
Fuzzy coordinator in control problems p 3515 N93-29552

COORDINATION POLYMERS
Organometallic compounds and polymers with second and third order nonlinear optical properties [AD-A264774] p 3338 N93-30610

COPOLYMERS
Thermodynamics of swelling and collapse of polyelectrolytic gels [ETN-93-93485] p 3331 N93-29064
Multichip module high speed testing [AD-A262989] p 3408 N93-29427

COPPER
Adsorption of sulfate on metal electrodes [AD-A263192] p 3309 N93-28540
In-situ x ray studies of the underpotential deposition of copper on platinum (3) [AD-A263361] p 3595 N93-29331
Magnetic character investigation of higher alcohol synthesis Cu-Co-Cr catalysts [DE93-009732] p 3316 N93-30653
Powder metallurgy: Solid and liquid phase sintering of copper p 3294 N93-30976
High thermal conductivity of diamond p 3294 N93-30977

COPPER ALLOYS
International Conference on Martensitic Transformations (ICOMAT 92) [AD-A262739] p 3321 N93-28591
An experimental investigation of radioactivity induced by ions associated with the operation of pulsed-power accelerators [DE93-011478] p 3575 N93-29151
Photo-desorption from copper alloys [DE93-011872] p 3326 N93-30490
Method of fabricating a rocket engine combustion chamber [NASA-CASE-MFS-28569-1] p 3338 N93-30565

COPPER COMPOUNDS
Characterization of copper iodide thin films fabricated via laser assisted molecular beam epitaxy [AD-A262823] p 3596 N93-29430
Sensitive detection of new superconductors created at ultra high pressures [AD-A264340] p 3597 N93-30161

COPPER OXIDES
In-situ x ray studies of the underpotential deposition of copper on platinum (3) [AD-A263361] p 3595 N93-29331

CORIOLIS EFFECT
Three-dimensional numerical simulation of gradual opening in a wave rotor passage [NASA-CR-191157] p 3252 N93-29072
Process for selectively recovering algae and protozoa [NASA-CASE-MFS-26124-1-NPO] p 3491 N93-29174

The effect of orthogonal-mode rotation on forced convection in a circular-sectioned tube fitted with full circumferential transverse ribs p 3254 N93-29937
Turbulent flow and heat transfer in idealized blade cooling passages p 3254 N93-29938
Some implications of a differential turbomachinery equation with viscous correction
[AD-A264693] p 3427 N93-30571
CORNERS
A corner matching and tracking strategy applied to videophony
[OUEL-1933/92] p 3380 N93-28896
CORONAL HOLES
Two-dimensional and three-dimensional time-dependent MHD model of extended corona
p 3653 N93-30496
CORONARY ARTERY DISEASE
Carbon monoxide exposure of subjects with documented cardiac arrhythmias
[PB93-179943] p 3497 N93-30890
COROTATION
Transient thermal behaviour of a compressor rotor with axial cooling air flow and co-rotating or contra-rotating shaft p 3255 N93-29946
CORRELATION
Studies of relativistic heavy ion collisions at the AGS (E814/E877)
[DE93-008541] p 3564 N93-28678
Selection and transmission of information. Issue 22: Republic interdepartmental collection (selected articles)
[AD-A262825] p 3615 N93-29431
Extracting infinite system properties from finite size clusters: Phase randomization/boundary condition averaging
[AD-A264712] p 3551 N93-30503
CORRELATORS
Photorefractive integrators and correlators
[AD-A264200] p 3597 N93-30144
Acousto-optic time-integrating correlators for processing wideband digital data p 3360 N93-30253
CORROSION
Preliminary test of liquid metal induced embrittlement in liquid LiPb and stainless-steel systems
[DE93-753130] p 3320 N93-28529
Polymeric materials for use in wet hydrochloric acid environments
[DE93-010881] p 3330 N93-28600
Operational results of pilot cell test with cermet inert anodes
[DE93-009338] p 3322 N93-29061
Direct use geothermal applications for brazed plate heat exchangers
[DE93-008559] p 3465 N93-30011
Materials studies for preventing corrosion in condensing environments
[PB93-185478] p 3327 N93-30815
CORROSION PREVENTION
Materials studies for preventing corrosion in condensing environments
[PB93-185478] p 3327 N93-30815
CORROSION RESISTANCE
Polymeric materials for use in wet hydrochloric acid environments
[DE93-010881] p 3330 N93-28600
Chromate-free corrosion resistant conversion coatings for aluminum
[DE93-009835] p 3336 N93-30051
Oxidation and hot corrosion of superalloys Rene 100 and X-40 at temperatures of 1475 F to 2000 F
[AD-A263747] p 3327 N93-30812
Materials studies for preventing corrosion in condensing environments
[PB93-185478] p 3327 N93-30815
CORROSION TESTS
The growth of small corrosion fatigue cracks in alloy 2024
[NASA-TM-107755] p 3451 N93-29069
APU diaphragm testing
[NASA-TM-108254] p 3272 N93-29501
Chromate-free corrosion resistant conversion coatings for aluminum
[DE93-009835] p 3336 N93-30051
Oxidation and hot corrosion of superalloys Rene 100 and X-40 at temperatures of 1475 F to 2000 F
[AD-A263747] p 3327 N93-30812
COSMIC BACKGROUND EXPLORER SATELLITE
On the meaning of delta T/T
[DE93-008482] p 3653 N93-28962
Tests of the particle physics-physical cosmology interface
[DE93-008483] p 3634 N93-28963
COSMIC DUST
Micrometeoroids and debris on LDEF
p 3638 N93-29356
An LDEF 2 dust instrument for discrimination between orbital debris and natural particles in near-Earth space
p 3286 N93-29707
COSMIC RAY SHOWERS
Research in theoretical physics
[DE93-008401] p 3603 N93-28961
COSMIC RAYS
Research in theoretical physics
[DE93-008401] p 3603 N93-28961
Status of LDEF ionizing radiation measurements and analysis p 3654 N93-29626
LDEF: Dosimetric measurement results (AO 138-7 experiment) p 3573 N93-29635
Progress report on the ultra heavy cosmic ray experiment (AO178) p 3654 N93-29646
Mathematical simulation of the induced (gamma)-radiation in structural materials of spaceships. Time dependence
[DE93-605312] p 3281 N93-31024
COSMOCHEMISTRY
Activities report of the Astronomical Society
[MITT-75] p 3629 N93-29008
COSMOLOGY
Topics in gauge theories and the unification of elementary particle interactions
[DE93-009370] p 3563 N93-28542
Dark matter: Theoretical perspectives
[DE93-008484] p 3633 N93-28676
Tests of the particle physics-physical cosmology interface
[DE93-008483] p 3634 N93-28963
Activities report of the Astronomical Society
[MITT-75] p 3629 N93-29008
Predictions of a non-Gaussian model for large scale structure
[DE93-010196] p 3636 N93-30528
Topics in inflationary universe medels and cosmic string theories p 3637 N93-30579
Fourth-rank gravity and cosmology
[DE92-644722] p 3637 N93-30918
General scalar-tensor theories for induced gravity inflation
[DE93-602505] p 3479 N93-30940
Fourth-rank cosmology
[DE92-641346] p 3637 N93-30997
COST ANALYSIS
Performance measurement systems: A best practices study
[AD-A262180] p 3506 N93-29444
Evaluating the bias of alternative cost progress models: Tests using aerospace industry acquisition programs
[AD-A262870] p 3624 N93-29477
A multilevel approach to minimum cost network flows
[AD-A264008] p 3550 N93-29978
Cost studies for commercial fuselage crown designs
p 3302 N93-30440
A unified approach for composite cost reporting and prediction in the ACT program p 3302 N93-30441
Performance and cost evaluation of bioremediation techniques for fuel spills
[PB93-175545] p 3474 N93-30762
Guideway structural design and power/propulsion/braking in relation to guideways, volume 1
[PB93-169902] p 3447 N93-30820
Process and assembly plans for low cost commercial fuselage structure p 3306 N93-30865
A representative survey of US space systems and methods for estimating their costs
[AD-A264159] p 3272 N93-30881
COST EFFECTIVENESS
Study on technology for effective utilization of carbon dioxide in view of global environment
[DE93-781440] p 3468 N93-28883
Spacecraft and launch systems for TACSAT applications p 3284 N93-29904
Cost effective TacSats for military support
p 3285 N93-29912
A multilevel approach to minimum cost network flows
[AD-A264008] p 3550 N93-29978
The First NASA Advanced Composites Technology Conference, part 1
[NASA-CP-3104-PT-1] p 3300 N93-30428
COST ESTIMATES
Evaluating the bias of alternative cost progress models: Tests using aerospace industry acquisition programs
[AD-A262870] p 3624 N93-29477
A perspective on acquisition of NASA space systems
[AD-A263246] p 3610 N93-29499
A representative survey of US space systems and methods for estimating their costs
[AD-A264159] p 3272 N93-30881
COST REDUCTION
Small Stirling dynamic isotope power system for robotic space missions
[NASA-TM-105785] p 3287 N93-28686
Low cost TACSAT for NATO surveillance
p 3285 N93-29911
The drive to cost-effective structural ceramics
[DE93-009722] p 3335 N93-30047
Advanced composite structural concepts and material technologies for primary aircraft structures
p 3300 N93-30430
Composites technology for transport primary structure
p 3300 N93-30431
Advanced technology commercial fuselage structure
p 3300 N93-30432
Design and manufacturing concepts for thermoplastic structures p 3301 N93-30434
Resin transfer molding for advanced composite primary aircraft structures p 3301 N93-30438
Consolidation of graphite thermoplastic textile preforms for primary aircraft structure p 3302 N93-30439
COUETTE FLOW
Stabilized space-time finite element formulations for unsteady incompressible flows involving fluid-body interactions p 3419 N93-29040
COULOMB POTENTIAL
Topics in gauge theories and the unification of elementary particle interactions
[DE93-009370] p 3563 N93-28542
Fast multipole method in simulations of aqueous systems
[AD-A263422] p 3567 N93-29336
COUNTER ROTATION
Transient thermal behaviour of a compressor rotor with axial cooling air flow and co-rotating or contra-rotating shaft p 3255 N93-29946
Flow and heat transfer between gas-turbine discs
p 3256 N93-29950
Numerical modeling and parameterization of gravity wave processes and effects in the atmosphere
[AD-A264331] p 3478 N93-30367
COUNTERMEASURES
Issues on human acceleration tolerance after long-duration space flights
[NASA-TM-104753] p 3495 N93-29651
Electro-optic characterisation of extremely wide bandwidth electrical signals
[AD-A264202] p 3392 N93-30145
COUNTERS
Measurement of a Michelson interferometer mirror velocity with a time interval analyzer
[AD-A263009] p 3430 N93-28659
COUPLED MODES
Nonlinear coupling of tearing fluctuations in the Madison Symmetric Torus
[DE93-010131] p 3584 N93-28602
Nonlinear mode coupling in free electron lasers
[AD-A263999] p 3439 N93-29883
COUPLINGS
Quick connect fastener
[NASA-CASE-MFS-28833-1] p 3445 N93-29846
COVALENT BONDS
Optically switchable conductive polymers
[AD-A264751] p 3337 N93-30557
COVARIANCE
A Monte Carlo study of the raw and normal varimax rotation criterion in factor analysis
[AD-A262516] p 3554 N93-28844
Investigation of a geodesy coexperiment to the Gravity Probe B relativity gyroscope program
[NASA-CR-193263] p 3460 N93-29179
Selection and transmission of information. Issue 22: Republic interdepartmental collection (selected articles)
[AD-A262825] p 3615 N93-29431
Determination of low frequency reference slipping for high frequency unstationary motion processes
[ILR-MITT-273(1992)] p 3455 N93-31017
CRAB NEBULA
GRO: Red-shifted electron-positron annihilation gamma-rays from radiopulsars
[NASA-CR-193243] p 3635 N93-30053
CRACK GEOMETRY
Method of continuously determining crack length
[NASA-CASE-LAR-14480-1-CU] p 3452 N93-29612
CRACK INITIATION
The growth of small corrosion fatigue cracks in alloy 2024
[NASA-TM-107755] p 3451 N93-29069
The initiation, propagation, and effect of matrix microcracks in cross-ply and related laminates
p 3304 N93-30847
Delaminations in composite plates under impact loads
p 3304 N93-30849
CRACK PROPAGATION
Crack length determination by ultrasonic methods
[DE93-008075] p 3450 N93-28567
Planning of a West Virginia University Research Center in the basic materials sciences
[DE93-011731] p 3592 N93-28647

The growth of small corrosion fatigue cracks in alloy 2024
[NASA-TM-107755] p 3451 N93-29069
The design and lifetime calculation of MHD generator walls based on subcritical crack growth in ceramics
[ISBN-90-9004009-9] p 3332 N93-29267
Damage growth in composite propellants
p 3348 N93-30088
Two-parameter crack tip field associated with stable crack growth in a thin plate: A hybrid analysis
[AD-A264221] p 3453 N93-30147
Stress-intensity-factor influence coefficients for axial and circumferential flaws in reactor pressure vessels
[DE93-006206] p 3454 N93-30213
The initiation, propagation, and effect of matrix microcracks in cross-ply and related laminates
p 3304 N93-30847
Micromechanics of fatigue in woven and stitched composites p 3304 N93-30850

CRACK TIPS
Crack length determination by ultrasonic methods
[DE93-008075] p 3450 N93-28567
Transformation toughening
[DE93-011805] p 3321 N93-28631
Two-parameter crack tip field associated with stable crack growth in a thin plate: A hybrid analysis
[AD-A264221] p 3453 N93-30147

CRACKING (CHEMICAL ENGINEERING)
A review of hot cracking in austenitic stainless steel weldments
[DE93-605280] p 3328 N93-31021

CRACKING (FRACTURING)
Whisker toughening of ceramic materials: A review
[DE93-011565] p 3336 N93-30129
Two-parameter crack tip field associated with stable crack growth in a thin plate: A hybrid analysis
[AD-A264221] p 3453 N93-30147
Durability of Quick Reaction Satellite Antenna (QRSA) trunnion castings
[AD-A264095] p 3281 N93-30813
Damage of multi-directionally reinforced ceramic-matrix composites p 3308 N93-30937

CRACKS
Crack length determination by ultrasonic methods
[DE93-008075] p 3450 N93-28567
Transformation toughening
[DE93-011805] p 3321 N93-28631
Environmental embrittlement of binary and Zr-doped Ni3Al
[DE93-008575] p 3321 N93-28679
Healing of lithographically introduced flaws in glass and glass containing ceramics
[DE93-010453] p 3330 N93-28761
The growth of small corrosion fatigue cracks in alloy 2024
[NASA-TM-107755] p 3451 N93-29069
Factors influencing the interlaminar fracture toughness and its evaluation in composites
[FFA-TN-1991-34] p 3451 N93-29076
Environmental effects on stitched RTM composites
[NASA-CR-193221] p 3297 N93-29107
Method of continuously determining crack length
[NASA-CASE-LAR-14480-1-CU] p 3452 N93-29612
Three-dimensional elastic stress analysis in materials with many inhomogeneities
[AD-A263736] p 3453 N93-29855
Interfacial melting in cracked explosives
p 3349 N93-30089
Two-parameter crack tip field associated with stable crack growth in a thin plate: A hybrid analysis
[AD-A264221] p 3453 N93-30147

CRANES
Lunar crane system p 3277 N93-29118
Leaky coaxial cable signal transmission for remote facilities
[DE93-007916] p 3383 N93-29348

CRASHWORTHINESS
Static and dynamic large deflection flexural response of graphite-epoxy beams
[NASA-CR-4118] p 3454 N93-30374

CRATERING
Report of the Meteoroid and Debris Special Investigation Group p 3638 N93-29355
Cratering in glasses impacted by debris or micrometeorites p 3340 N93-29368

CRATERS
Continued investigation of LDEF's structural frame and thermal blankets by the Meteoroid and Debris Special Investigation Group p 3282 N93-29357

CRAY COMPUTERS
Neural network simulations on massively parallel computers: Applications in chemical physics
[DE93-006739] p 3538 N93-28894

CREEP PROPERTIES
Ultrahigh temperature assessment study: Ceramic matrix composites
[AD-A262740] p 3295 N93-28592
Flux lattice relaxation, noise, and symmetry-breaking in frustrated Josephson junction arrays
[DE93-008713] p 3593 N93-29094
Bounds on internal state variables in viscoplasticity
[NASA-TM-106215] p 3451 N93-29196
Mechanisms of fracture and creep of structural alloys
[AD-A263108] p 3324 N93-29799
Hydrodynamic interactions among fibers in high efficiency filters
[DE93-007117] p 3424 N93-30035
Plastic deformation behaviour of oxide dispersion strengthened titanium alloys
[ONERA-NT-1990-6] p 3326 N93-30138

CREEP STRENGTH
High temperature creep and oxidation resistant chromium silicide matrix alloy containing molybdenum
[NASA-CASE-LEW-15697-1] p 3323 N93-29172
Tensile creep behavior of polycrystalline alumina fibers
[NASA-TM-106269] p 3340 N93-30938

CREEP TESTS
Tensile creep behavior of polycrystalline alumina fibers
[NASA-TM-106269] p 3340 N93-30938

CREWS
Sound attenuation characteristics of the standard DH-132A and SPH-4 helmets worn in combination with standard issue earplugs
[AD-A263011] p 3506 N93-29406

CRITERIA
A Monte Carlo study of the raw and normal varimax rotation criterion in factor analysis
[AD-A262516] p 3554 N93-28844

CRITICAL EXPERIMENTS
Loading and testing a light scattering cell with a binary fluid mixture near its critical composition
[NASA-CR-193147] p 3415 N93-28557

CRITICAL LOADING
Ion-beam-assisted deposition of wear-resistant coatings
[DE93-011529] p 3330 N93-28687
Tensile study of single-crystal ternary L1(2) trialuminide Al66Ti25Mn(sub g)
[AD-A264297] p 3601 N93-30819

CRITICAL PRESSURE
Super critical water oxidation on energetic materials
[DE93-010704] p 3342 N93-29312

CRITICAL TEMPERATURE
Super critical water oxidation on energetic materials
[DE93-010704] p 3342 N93-29312
Effect of lead addition on the formation of superconducting phases in Bi-Sr-Ca-Cu-O ceramics
[DE93-606893] p 3339 N93-30773

CROP GROWTH
National remote sensing programme 2 ACMS project. Phase 1: Validation. Part 1: Definition of validation experiment
[BCRS-92-10-PHASE-1-PT-1] p 3461 N93-29465

CROP INVENTORIES
National remote sensing programme 2 ACMS project. Phase 1: Validation. Part 1: Definition of validation experiment
[BCRS-92-10-PHASE-1-PT-1] p 3461 N93-29465

CROSS CORRELATION
Theoretical bit error rate performance of the Kalman filter excisor for FM interference
[AD-A263018] p 3383 N93-29407
Automated satellite image navigation
[AD-A262868] p 3269 N93-29475

CROSS COUPLING
Adaptive motion control of mobile robots
p 3545 N93-30903

CROSS FLOW
Experimental study of heat transfer close to a plane wall heated in the presence of multiple injections (subsonic flow) p 3253 N93-29931

CROSSLINKING
Characterization of slow chromophore reorientation in nonlinear optical polymers by two-dimensional MAS NMR
[AD-A264809] p 3338 N93-30596
Water-soluble polyphosphazenes and their hydrogels
[AD-A264883] p 3340 N93-30909

CRUDE OIL
The thermodynamic properties of thianthrene and phenoxathiin
[DE93-000124] p 3603 N93-28964
Fugitive hydrocarbon emissions from Pacific OCS facilities. Volume 2: Executive summary and user's guide
[PB93-173805-VOL-2] p 3471 N93-29861

CRYOGENIC COOLING
Miniature long-life space cryocoolers
p 3378 N93-28825

CRYOGENIC EQUIPMENT
Preliminary experimental results for a cryogenic brush seal configuration
[NASA-TM-106236] p 3416 N93-28627
Cryogenic Heat Pipe Experiment (CRYOHP)
p 3265 N93-28721
Spaceborne passive radiative cooler
p 3378 N93-28802
Miniature long-life space cryocoolers
p 3378 N93-28825
Cryogenic magnetic bearing
[AD-A264716] p 3446 N93-30512

CRYOGENIC FLUID STORAGE
Tank Pressure Control Experiment (TPCE)
p 3264 N93-28712
Tank Pressure Control Experiment/Thermal Phenomena (TPCE/TP) p 3264 N93-28713

CRYOGENIC FLUIDS
Tank Pressure Control Experiment (TPCE)
p 3264 N93-28712
Tank Pressure Control Experiment/Thermal Phenomena (TPCE/TP) p 3264 N93-28713
Cryogenic Heat Pipe Experiment (CRYOHP)
p 3265 N93-28721

CRYOGENIC ROCKET PROPELLANTS
Specific impulse calculations of high energy density solid cryogenic rocket propellants. 1. Atoms in solid H2
[AD-A263208] p 3341 N93-28517

CRYOGENICS
Inertial confinement fusion target component fabrication and technology development support
[DE93-010836] p 3585 N93-28836

CRYOSTATS
TESLA test cell cryostat support post thermal and structural analysis
[DE93-008365] p 3407 N93-29048
Structural design of cryostat and port penetration of International Thermonuclear Experimental Reactor (ITER)
[DE93-753267] p 3587 N93-29243

CRYSTAL DEFECTS
Deformation mechanisms in Be(sub 12)X compounds
[DE93-009080] p 3320 N93-28548
Flux lattice relaxation, noise, and symmetry-breaking in frustrated Josephson junction arrays
[DE93-008713] p 3593 N93-29094
Defect studies in low-temperature-grown GaAs
[DE93-010405] p 3595 N93-29417
Balanced technology initiative on computational mechanics of materials
[AD-A263906] p 3453 N93-29863
Low-cost, high-efficiency solar cells utilizing GaAs-on-Si technology
[DE93-000096] p 3464 N93-29965
Microstructural basis for enhanced shock-induced chemistry in single crystals of ammonium perchlorate
p 3319 N93-30092
Defect density measurements in a shocked single crystal of ammonium perchlorate p 3319 N93-30093
Molecular dynamics of detonation in crystals with defects p 3350 N93-30097
The 2-6 semiconductor superlattices
[AD-A264343] p 3597 N93-30164
Computational analysis of slip in PETN
[DE92-040222] p 3598 N93-30445
The calculation of electrostatic interactions and their role in determining the energies and geometries of molecular HE crystals
[DE92-040374] p 3570 N93-30448
Radiation effects in FCC metals and intermetallic compounds: A molecular dynamics computer simulation study
[DE93-009546] p 3600 N93-30668

CRYSTAL DISLOCATIONS
Deformation mechanisms in Be(sub 12)X compounds
[DE93-009080] p 3320 N93-28548
Plastic deformation behaviour of oxide dispersion strengthened titanium alloys
[ONERA-NT-1990-6] p 3326 N93-30138

CRYSTAL GROWTH
Measurement of the relative and absolute microgravity environment of space platforms, recent flight results, and determination of the spatial microgravity field
p 3266 N93-28725
Growth, characterization and device development in monocrystalline diamond films
[AD-A263204] p 3593 N93-28874
Follow up on the crystal growth experiments of the LDEF p 3602 N93-29381
Flame or plasma synthesis of diamond under turbulent and transition flow conditions
[AD-D015689] p 3333 N93-29456

Growth and development of GaInAsP for use in high-efficiency solar cells
[DE93-000098] p 3465 N93-30208
Study on diamond semiconductor
[DE92-531076] p 3413 N93-30622
Visible light emitting materials and injection devices
[AD-A263499] p 3601 N93-30811
Growth model of Au films on Ru(001)
[DE92-642126] p 3602 N93-30998

CRYSTAL LATTICES
Neutron scattering studies of the structures and lattice dynamics of the alkali metals
[DE93-008272] p 3593 N93-28956
Characterization of copper iodide thin films fabricated via laser assisted molecular beam epitaxy
[AD-A262823] p 3596 N93-29430
Integrals of motion on the group of invariance of an interval in three-dimensional spaces
[DE93-606090] p 3606 N93-30797
Growth model of Au films on Ru(001)
[DE92-642126] p 3602 N93-30998

CRYSTAL OPTICS
Photorefractive integrators and correlators
[AD-A264200] p 3597 N93-30144

CRYSTAL OSCILLATORS
Radiation sensitivity of quartz crystal oscillators experiment for the Long Duration Exposure Facility (LDEF), part 2 p 3414 N93-29685

CRYSTAL STRUCTURE
Powder x ray diffraction patterns of energetic materials for use as reference standards
[DE93-009903] p 3592 N93-28568
Be3(AsO4)2 2H2O: A new berylloarsenate phase containing bridged tetrahedral 3-rings
[AD-A262518] p 3592 N93-28584
Neutron scattering studies of the structures and lattice dynamics of the alkali metals
[DE93-008272] p 3593 N93-28956
The synthesis and ab initio structure determination of Zn4O(BO3)2: A microporous zincoborate built up from fused 3-ring and 5-ring sub-units
[AD-A262504] p 3594 N93-29138
Structure and switching dynamics in ferroelectric crystal and liquid crystal thin films
[AD-A263664] p 3594 N93-29293
Properties of superconducting YBa2Cu3O(6+4) ceramic materials: Effect of processing parameters
[AD-A263441] p 3334 N93-29790
Anelastic relaxations associated with local disordering in grain boundaries
[AD-A263101] p 3596 N93-29796
Improved field emitter current densities and stability through the application of a proprietary process
[AD-A264048] p 3411 N93-30031
A steric hindrance model for the crystal orientation dependence of the shock initiation sensitivity of PETN explosive
[LA-UR-92-1427] p 3345 N93-30074
Atomic force microscopy of ammmonium perchlorate
p 3349 N93-30091
Design of acentric materials: X ray structures of guanidinium p-nitro- and p-hydroxybenzenesulfonate
[AD-A264220] p 3597 N93-30146
Two new titanium pyroarsenates: Alpha-TiAs2O7 and Beta-TiAs2O7
[AD-A264632] p 3599 N93-30518
1,2-Dimethyl-1,2-Disila-Closo-Dodecaborane(12), A silicon analog of an ortho-carborane: Synthesis; x ray crystal structure; NMR, vibrational and photoelectron spectra; bonding
[AD-A264709] p 3599 N93-30568
Study on diamond semiconductor
[DE92-531076] p 3413 N93-30622
The characterization of materials using x ray diffraction p 3293 N93-30968
A dynamical model of structural phase transition in La2CuO4
[DE93-605325] p 3602 N93-31025

CRYSTAL SURFACES
Structure, adhesion, and stability of metal/oxide and oxide/oxide interfaces
[DE93-012930] p 3325 N93-30060
Molecular dynamics of detonation in crystals with defects p 3350 N93-30097

CRYSTALLINITY
Observation of reaction intermediates in crystalline RDX p 3318 N93-30067

CRYSTALLIZATION
Crystallization of nanocomposite glasses made by the SSG process
[AD-A262892] p 3333 N93-29511
An extension of a kinetic theory of polymer crystallization through the exclusion of negative barriers
[AD-A264810] p 3334 N93-29660

CRYSTALLOGRAPHY
Two new titanium pyroarsenates: Alpha-TiAs2O7 and Beta-TiAs2O7
[AD-A264632] p 3599 N93-30518

CRYSTALS
Excited states in electronic structure calculations
[DE93-007704] p 3592 N93-28642
A technique for single-pulse spectrum and pulse width measurements for an IR-FEL
[DE93-007732] p 3436 N93-28847
Silicon crystal under bending
[DE93-010522] p 3593 N93-28888
Modification of spectral distributions by multilayer structures
[DE93-009308] p 3310 N93-29059
Structure and switching dynamics in ferroelectric crystal and liquid crystal thin films
[AD-A263664] p 3594 N93-29293
Proceedings of the 25th European Conference on the Application of Polar Dielectrics to celebrate the 25th anniversary of the Dielectric Society, incorporating the 1st International Workshop on Integrated Ferroelectrics
[AD-A263427] p 3332 N93-29337
Follow up on the crystal growth experiments of the LDEF p 3602 N93-29381
Measurements of light scattering by small particles at an angle of zero degrees
[AD-A263856] p 3580 N93-29887
